The Stevens Peak M. Co., near Mullan, resumed operations this week, having been idle since the snowslide of a few weeks ago, which covered the tunnel and wrecked the buildings. Drifting will be started on the ledge, which was cut in January, says Manager Baillie.

The Snowstorm's 2-drill compressor plant, near Mullan, was put in operation last week, being run by water power. The management expects to put in a larger pipe line to the flume.

MICHIGAN.

HOUGHTON COUNTY.

The sale of land, near the Atlantic mine, south of Houghton, to be voted on at the annual meeting of the Atlantic M. Co., is the proposed site of the smelter for the South Range mines. It is said the Copper Range Co. interests furnish the capital and the Atlantic the land.

INGHAM COUNTY.

In his annual report to the directors, Superintendent Harris of the Quincy, near Mason, says the underground electric haulage, north of No. 6 shaft, has given satisfactory service during the past year and has been the means of transporting rock to shaft at a considerably lower cost per ton than formerly; 50% of the stamp rock mined, tributary to this shaft, is handled this way. At present there are in operation four electric locomotives and thirty-six steel cars of two and three-quarters tons capacity each, and ten additional electric locomotives will be installed this spring.

MONTANA.

BEAVERHEAD COUNTY.

P. I. Smith, manager of the Crystal Graphite Co., says C. Frohman of Chicago, Ill. has leased their entire group of graphite mines in Axe canyon, near Dillon, for twenty years. The mines will be developed extensively, and Smith remains as manager.

FERGUS COUNTY.

The Spring Creek Coal Co. has been incorporated by J. A. Borgh, J. L. Bright and A. Green, of Lewiston.

The Hegener mine, on Carpenter creek, near Lewiston, has been shut down, the development work not showing ore bodies of sufficient value to warrant the operators to continue, says the Argus.

The Abbey Cyanide G. M. & M. Co., operating north of the Barnes-King group, near Keodall, have begun work on an incline shaft to develop their ore bodies, says Superintendent E. Johnson. A gasoline hoist will be installed. Drifts and crosscuts will be run when the shaft reaches the 75-foot point.

GRANITE COUNTY.

J. Graot, operating the Blue Bird group at the head of McDermott gulch, near Phillipsburg, says he is opening up a body of ore, which can be handled by cyaniding. Machinery will be installed this spring.

LEWIS AND CLARKE COUNTY.

Longmaid Bros. of Helena have bought the Gloster mine, near Marysville. The lead has been developed to a depth of 800 feet. It is the intention to operate the old mill and put in cyanide tanks to handle the tailings.

MADISON COUNTY.

W. B. Millard of Nebraska has bought a one-sixth interest in the Kearsarge mine, near Virginia City, for \$2500.

J. W. Wright, developing the Silver Group claims in Carmichael district, 6 miles from Pony, reports a strike of 18 inches of ore in the bottom of the shaft down 65 feet, which assays 400 ounces in silver.

A strike has been made in the Whippoorwill mine, near Virginia City, in Sand Creek district. While drifting the lessees cut a 12-inch body of gold ore, which assays \$300.

L. D. McCall of Chicago, president of the Bismarck Nugget Gulch M. Co., near Virginia City, says the work done so far has been largely experimental, but now developments are to be increased. They own the Levi Carter mill and smelter on Mill creek. The mill capacity will be increased to 100 tons daily, and a bucket tramway,

to transport the ore from the mine to the mill, a distance of 1 mile, will be put up. In the spring it is intended to install an electric plant farther up the creek capable of producing 500 H. P. There are fifty men on the payroll.

MISSOULA COUNTY.

The Dennemora G. & C. M. Co. has been incorporated to develop a group of claims near St. Regis.

A strike, in which 2 feet of galena were opened, is reported made on the Tarbox silver-lead mine, 3 miles from Saltese. The strike was made on the drift being run from the bottom of the 225-foot shaft. The company has decided to sink the shaft to the next level.

POWELL COUNTY.

A dredge will be installed this season for placer mining on Georgetown flats, near Deer Lodge.

RAVALLI COUNTY.

The Wood Placer M. Co. at Hughes creek, near Hamilton, has twenty-two men at work digging the blighline ditch to furnish pressure for the lower camp, the bedrock drain for ground below Keating's claim and putting up the new camp on the lower ground.

NEVADA.

ESMERALDA COUNTY.

(Special Correspondence)—The cyanide plant which has been treating the tailings from the Monte Diablo mill at Sodaville, Nevada, the past six months has closed down for the winter. A. Weihe, of San Francisco, is the owner of the plant, which is fifty tons capacity. Tailings are low grade, containing gold, silver and quicksilver, with some copper and traces of antimony, and in character are almost identical with large dumps of tailings at Belleville from the Holmes and other Candelaria mines.

Sodaville, March 1.

EUREKA COUNTY.

Treasurer B. L. Smith of the Rocco Homestake Co.'s mines, near Eureka, reports that during the year they produced ore that netted \$46,925, and while the earnings have not equaled those of the two years preceding, the shrinkage has been offset by the results of exploratory work. An ore shoot opened up affords an average of 40% lead and 21 1/4 ounces silver.

HUMBOLDT COUNTY.

The Lovelock Commercial Co. will ship 100 tons of gypsum per week to San Francisco, Cal.

LINCOLN COUNTY.

In the Yellow Pine mining district, near Sandy, the Nevada-Keystone M. Co. is operating a 30-ton cyanide plant. The output each month amounts to \$40,000.

The De Lamar Extension M. Co. has incorporated at Salt Lake City, Utah, to operate a group of six claims adjoining the De Lamar mine, near De Lamar. R. B. Cameron, W. T. Mitchell, M. R. Stewart, D. S. Truman, L. F. Harr, E. E. Sanders and J. T. Scott are the directors.

Electric power is to be substituted for steam in operating the De Lamar mine and mill plant at De Lamar.

At the Blossom mine, near Searchlight, twenty-four men are at work and ten stamps are dropping in the mill. The main shaft is down 350 feet and a gasoline hoist is in operation. A drift is being run south at the 330-foot level.

Okey & Parsons have resumed operations on the Little Bug and the Big Bug claims near Searchlight.

LYON COUNTY.

Manager F. Leonard, at Sutro, says operations have begun on the tunnel to unwater the south end of the Comstock by the Gold Canyon Extension Co. This tunnel will begin at the end of the Sutro at the Alta shaft and extend to the Dayton shaft, 8300 feet. It will run on the vein and open up the mine at an average depth of 1000 feet.

The cyanide process is to be added to the mill of the Comstock Tunnel Co. at Sutro, says Manager F. Leonard. It is estimated the tunnel waste dump contains 100,000 tons of low-grade ore that will be cyanided.

NYE COUNTY.

F. Work, superintendent of the Hannapah Co.'s mines east of Butler, says drifting has begun at a depth of 150 feet in the incline.

STOREY COUNTY.

The directors of the Con. New York M. Co. have decided to resume work in the mine as soon as arrangements can be made. A body of gold-bearing ore exists on the 900 level. An electric hoist will be put in.

The Hap-Hazard mining location in Flowery district, near Virginia City, has

been leased by F. F. Babcock for one year. The property was formerly known as the Adriatic mine.

The water in the Chollar combination shaft on the Comstock lode fell 2 inches during the past week and stands 163 feet 2 inches below the measuring point in that shaft, reports Manager Ryan. At the C. and C. shaft elevator No. 1 is in steady operation except when stopped a few hours each day to save the expense of pressure water taken from the surface. The mine water is being held below the 2150-foot level station. The experimental test of the three pumps in the new pumping station on that level having been a success, arrangements are being made for the lowering of the water to a greater depth, with these pumps and the hydraulic elevators working in combination.

At the Utah Con. mine, on the Comstock, near Virginia City, they are dismantling the steam hoist plant and preparing a foundation for an electric hoist.

WHITE PINE COUNTY.

Manager P. C. Weber of the Sapho M. Co. says operations will be resumed at the Sapho mine at Ely.

M. L. Requa of San Francisco, Cal., has bought a group of four claims adjoining the Ruth group, which he bought last month, near Ely.

The Pilot Knob Copper Co. will resume development on their mines near Ely, adjoining the holdings of the New York & Nevada C. Co. on the west.

NEW JERSEY.

HUDSON COUNTY.

It is reported from Bayonne that the Standard Oil Co. has obtained control of the Orford Copper Works, adjoining the plant of the Standard Oil Co.

NEW MEXICO.

SIERRA COUNTY.

A. J. Hirsch of El Paso, Texas, manager of the Prosper G. M. Co., near Hillsboro, says he will install a concentrating mill of forty tons daily capacity and of the Huntington type. W. Miller has bought the Snake and Opportunity mines and has an option on the Dell mine, which adjoins the Richmond mines on the west. W. A. Farish of Salt Lake City, Utah, is manager.

The Wix M. Co., near Hillsboro, owned by Chicago men, have fifty men at work and expect to install a 100-ton plant within six months.—The Richmond G. M. Co. will build a railroad from Lake Valley to Hillsboro, a spur to run from Hillsboro to the Richmond mines.—The Lake Valley M. Co., at Lake Valley, has 100 men working.

SOCORRO COUNTY.

T. J. Curran of Denver, Colo., president of the Mogollon G. & C. Co., working near Cooney, says their mill is in operation. It has a capacity of 200 tons a day and has a cyanide plant connected with it. Ore bins have been built of 800 tons capacity. The ore carries gold and copper. The company, which is composed of Denver and New York men, owns, besides the Cooney group, twenty-one other claims in the vicinity. Machine drills are being installed.

OREGON.

BAKER COUNTY.

The 20-stamp mill at the Psyche mine in Greenhorn district, near Sumpter, is in operation, says Manager Fawcett. The stamps are 1050 pounds weight and the mortars the wide, deep discharge type.

Superintendent J. McLeod of the Ross Gulch mine, near Sumpter, says he will continue the drifts being driven and will resume sinking the shaft.

President Costello of the Storm King M. Co., operating the Storm King group, near Sumpter, says a road will be built connecting with the Baby McKee and additional machinery put in.

At 600 feet in the Oregon Monarch tunnel, near Sumpter, Superintendent T. Moffatt says a 6-foot vein of milling ore assaying \$0 has been struck.

A strike of ore carrying a shoot of sylvanite is reported from the Riverside group of claims on Snake river below Huntington, and owned by J. Baisley.

The ore shoot at the Golconda mine, near Sumpter, that has been drifted on in the tunnel level and proved for 250 feet, was struck last week on the 100-foot level in the drift south of the shaft. Arrangements will be made to increase the plant to sixty stamps. The Columbia mine, near Sumpter, will put in forty more stamps.

At the Red Boy mine, near Sumpter, the three compartment shaft will be sunk 500 feet deeper. A station tank will be put in at the 200-foot level and work done at this station. Two pumps will be installed and the machinery of the hoist overhauled. By June 1st work on the

electric power plant will begin. Secretary J. A. Howard of the Red Boy Co. says their mill will not be shut down during these developments, as previously reported.

GRANT COUNTY.

At the Alamo mine, at Alamo, the drift on the main vein is 100 feet long, bringing the face under the workings in No. 2 tunnel. Men are drifting on the adit level. It is proposed to install a mill in the summer, says the American.

JOSEPHINE COUNTY.

The Pease hydraulic mine on Upper Grave creek, near Grant's Pass, has installed an additional plant.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Glohe M. Co. have had their plant in operation since Feb. 1, and their shaft is down 150 feet, says Superintendent Wade.

The Jupiter G. M. & M. Co., in which Colorado Springs, Colo., men, are interested, is operating the Minerva and Gustin groups on Blacktail gulch, near Deadwood. The Minerva mill has been remodeled and a cyanide plant added, both being able to handle 150 tons of ore per day. The plant is expected to be in operation by March 15. The mill has forty stamps. The company owns a water right in Blacktail gulch sufficient to supply a plant of 500 tons capacity.

Another ore body has been opened up near Lead on the southerly extension of the Homestake belt by the United Ruby G. M. Co., operating on Bear Butte creek. They are taking out free-gold quartz.

The new plant at the shaft of the Anacoda G. M. Co., on the divide between Elk and Bear Butte creeks, near Lead, is in operation.

E. P. Farnham of Central City, operating at the head of Falsebottom creek, near Deadwood gulch, reports having opened up a body of gold ore assaying \$16. The group lies in the phonolite belt and the ore is phonolitic.

In Spruce gulch, $\frac{1}{2}$ miles from Deadwood, the Lexington Hill G. M. Co. has bought 230 acres of mining property, including the mines and cyanide mill of the Highland Chief M. Co., the Lexington Hill group, the Belle Eldridge, Annie and the Cohins millsite on the gulch. The claims all lie in one group. The company proposes to enlarge the Highland Chief mill of twenty stamps and leaching tanks capable of treating forty tons per day. In addition to this another mill of 200 tons daily capacity will be built farther down the gulch, and a power plant will be built in Deadwood, the power to be transmitted by electricity. The proposed new cyanide mill will not only handle ore from the company's ground, but custom ore also. The company is composed of T. F. Cornforth of Denver, Colo., H. F. Wells at al of Boston, Mass., and H. Bischoff, of Deadwood.

UTAH.

The Salt Lake Tribune says: February in the ore and bullion market closed on settlements aggregating \$2,039,500, as compared with \$2,036,810 for January, and with \$1,434,900 for February, 1902. The output of copper reached a total of 3,411,590 pounds, divided as follows:

	Pounds.
American.....	675,000
Bingham Con.....	800,590
Highland Boy.....	1,204,000
United States.....	732,000
Total.....	3,411,590

In the output of each of the plants except that of the American S. & R. Co., the copper hullion carries gold and silver.

BEAVER COUNTY.

Manager F. H. Lathrop of the Williams group, adjoining the Old Hickory, below Milford, says development work has begun.

R. L. Nolf, secretary of the Milford G. & C. Co., says work on its mines near Milford will begin April 1.

Manager Farnsworth of the Horn Silver mine, at Frisco, says he will begin shipments to the smelter of the zinc ore which they have blocked out.

DAVIS COUNTY.

C. K. Rowland and associates of Salt Lake City, of the Lake Shore Gas & Oil Co., will begin drilling operations on their holdings along the shore of Great Salt Lake, southwest of Farmington. They expect to sink 2500 feet.

JUAB COUNTY.

Manager C. E. Loose of the Grand Central M. Co., at Eureka, reports having opened up in their north workings a body of ore 60 feet wide carrying values in gold, silver, copper and lead.

Superintendent J. T. Williams of the Gresbeck-Whitney-Transvaal mine, near

Eureka, says work has been temporarily suspended.

At the Carisa mine, near Eureka, a 4-drill compressor is being set up.

Manager Allen of the Centennial Eureka mine, at Eureka, has decided to start exploring the ore bodies lying below the 1600-foot level, and to do this the main shaft will be sunk 400 feet below the present deepest workings. The shaft will be enlarged to three compartments, the present arrangement being a double-compartment shaft and a manway. This is to provide room for pump columns in case a large body of water is struck in the new ground.

Work on the Selma group of claims, in North Tintic, near Eureka, has been resumed under Superintendent L. C. Peterson. The property is being developed through the tunnel, which is in 325 feet.

Engineer Rohlfing, for the Bullion-Beck Co., near Eureka has completed maps of their ground dividing all the levels from the 200 to the 1600 into blocks of 100 feet, which will be leased and the royalties regulated by net value of ore taken out. The company's hoisting plant and blacksmith shop will be at the disposal of the leasers, who will pay a fixed price for the number of cars of ore or rock hoisted.

Ore shipments have resumed from the Victor-Boss Tweed, near Eureka, says Manager E. V. McCune. At present he is stopping on the 300 and 400 foot levels.

Ore shipments for the week ending Feb. 28 from the Tintic district amounted to 139 carloads, and for the month 511 carloads were forwarded to the smelters, distributed among the mines as follows: Ajax 3, Bullion-Beck 15, Centennial-Eureka 163, Carisa 4, Dragon Iron mine 100, Eagle & Blue Bell 8, Grand Central 94, Gemini 37, Lower Mammoth 12, La Clede 1, Martha Washington 4, Mammoth 38, May Day 1, Noon's Iron mine 4, Uncle Sam 6, Yankee Con. 20, Star Con. 1.

PIUTE COUNTY.

The P. A. H. Franklin Co. during the past week obtained options on several properties on both the Marysvale and Kimberly sides of Gold; the Elephant, Wedge Extension and others are included.

SALT LAKE COUNTY.

The Silver Shield branch of the Franklin tunnel, near Bingham, is expected to cut Silver Shield ground by April 1. The company has installed an engine and dynamo, by which the electric locomotive is operated and the tunnel lighted.

The hoist at the Columbus Con. mine of Alta is in operation. A winze is being sunk on No. 2 fissure off from the main tunnel, where a 4-foot body of ore has been opened up.

SUMMIT COUNTY.

The Nail Driver Extension M. & M. Co. has incorporated at Salt Lake City. The company owns a bond and lease on the St. Lawrence group of claims in the Uintah district, this county. W. M. Ferry, R. Gorlinski, D. H. Porter, M. E. Fitzgerald and M. McPolin are directors. The Daly-Judge mill at Park City was given a trial run last week and is expected to be in full operation by the 10th inst.

At the Daly West, at Park City, there are 500 men at work.

At the zinc plant at Park City, operated by the Utah Metals Co., says Manager Dickerman, there are in the bins 300 tons of concentrates, divided into two classes, which will be shipped to Kansas. The first class contains 56% of the zinc and the balance mainly in sulphur, with iron and lead; the second class contains 40% iron, seventeen ounces silver and 5% lead, with the balance in sulphur, the latter finding a market at any of the smelters.

The report of President J. E. Bamberger of the Daly West M. Co. of Park City for the year ending Dec. 31, 1902, shows that the total sum of \$1,827,585.72 was received for ore during the year. Dividends aggregating \$1,044,000 were paid during the same period. To the end of 1902 this company has paid in dividends \$2,259,000. The mill superintendent, F. W. Sherman, reports that since the introduction of the slimes plant, with sizing tanks and settling vats, the lead values in the mill tailings have been reduced about one-half and silver values $\frac{1}{2}$ to 2 ounces per ton, equivalent to 177 tons of lead and 90,000 ounces of silver, besides reduction in cost of transportation and treatment of 500 tons of silica eliminated by the improvements made in the plant.

The reconstructed mill at the Daly-Judge mine, near Park City, resumed operations this week.

TOOELE COUNTY.

L. Harris, manager of the Sunshine M. Co.'s mines and mill at Sunshine, Camp Floyd district, says the plant will be remodeled, additional presses put in and made to handle the full output of that character from the mill. The mill is to be overhauled and its capacity increased.

UTAH COUNTY.

In the Goodsell M. Co.'s mine, near American Fork, they have opened up 4 feet of ore in the drift off the 207-foot level, showing \$2.50 in gold, with values in lead and silver.

The Uintah Oil Co. will drill a 12-inch well on their holdings near Colton. The well will be put down 1500 feet, but the rig to be put up will have a capacity for 3500 feet.

WASHINGTON.

FERRY COUNTY.

Ewell & Galloway have begun operations at Torado Meadows, near Republic, on the Long Green mine and will sink a 100-foot shaft. Machinery for the Lucile Dreyfus is on the ground. Work will be resumed on the Violet mine, near Republic. The tunnel to crosscut the ledge, already in 150 feet, will be extended another 100 feet. At the San Poil mine the work of sinking the winze below the lower tunnel level was started last week. The bottom is in pay ore and it is proposed to sink a new working shaft from the surface and equip it with heavy hoisting machinery.

J. L. Harper, having bonded the Gold King mine, near Republic, says the incline shaft was sunk under the vein and at 32 feet cut 3 feet of ore, with an 18 inch shoot on the foot wall assaying \$30. He will put up a whim on the shaft and start increased development work.

Work at the Lone Pine-Surprise mine, near Republic, was resumed this week, says C. P. Robbins, president of the company.

KING COUNTY.

The Seattle Iron & Steel Co. has been incorporated and will build at Seattle iron furnaces with 200 tons daily capacity, and a 100-ton steel plant and rolling mill. They propose to work magnetic ores from deposits of Texada island, B. C., and intend ultimately to increase the plant by addition of tin plate mills and tube pipe works. They will take over the Pacific Steel Co.'s plant at Irondale, Wash.

OKANOGAN COUNTY.

The Slate creek platinum claim in the Similkameen district, near Loomis, owned by H. Blair of Vancouver, J. M. Bowhead of London and Similkameen men, will be developed in the spring.

At the Six Eagles group, near Loomis, they are driving a tunnel, in 1008 feet, and expect to strike the Ohio ledge in 250 feet farther, giving a vertical depth of 800 feet. G. L. Brown of Mansfield, O., one of the directors, says that as soon as the ledge is cut a concentrating mill will be installed, the power for which will be secured from an electric plant to be built at the Similkameen falls. Temporarily there will be a plant of 1000 H. P., but later increased to 10,000.

STEVENS COUNTY.

Boyles Bros. have taken their diamond drill outfit to the Colville group in the Flat creek district, near Bosshurg. The Colville group is in lime and the ore carries lead. It is operated by P. Watlet, who is driving a 500-foot tunnel in the property.

The Little Giant M., M. & S. Co., operating 3 miles east of Rock Cut and 22 miles from Marcus, reports a strike in its 50-foot shaft showing an ore body 36 inches wide which assays copper 15%, silver seven ounces, gold \$2.68. G. W. Reynolds of Marcus is president and manager.

Machinery for the Jay Gould mine, near Chewelah, is on the ground. The shaft will be sunk to the 300-foot level.

WYOMING.

UINTA COUNTY.

A body of oil-bearing limestone shale is reported found on Slate creek, 11 miles north of Kemmerer. The outcrop is 40 feet thick. Casey & Co. of Kemmerer have located 15,000 acres. It is 1 mile north of the Kemmerer coal fields. Manager C. W. Short of a St. Louis company is sinking a well at Fossil.

The Michigan-Wyoming Oil Co. are at work north of Evanston.

The Atlantic & Pacific Oil Co. are preparing to begin work at Spring valley.

The Idaho-Wyoming Con. rig at Fossil is drilling.

The American Con. rig on section 34, Spring valley, is drilling. The old casing has been removed and heavier substituted.

FOREIGN.

BRAZIL.

Copper is reported to occur in various parts of Bahia district. The Bahia Exploration Co., an English concern, has recently acquired a large area of copper-bearing land and intends to commence mining and smelting hornblende schist. Samples are said to contain 2% to 40%

copper, the average being about 4%. The mine is 50 miles west of the station of Jaguarary, on the line of the Bahia & San Francisco Railroad. The company is making experimental borings.

BRITISH COLUMBIA.

The Chinese placer miners are starting out for the spring work along the banks of British Columbia rivers. From Lillooet it is reported the Chinamen and Indians have made an early start to their grounds on the Fraser river, and from East Kootenay it is learned the Chinese companies are preparing for a heavy season on Wild Horse creek.

At the Granby mines at Phoenix the sixty-drill compressor is in place. It will be driven by electricity in two parts, with two motors, each of 700 H. P. capacity. The motors will be in place by April 1. With the present drill capacity the average day's shipments of ore are 1500 tons, says Superintendent W. Y. Williams, and this addition will give a capacity of 5000 tons every twenty-four hours, and it is the intention to increase the smelter capacity to this figure. Williams says even if the smelter was closed in two weeks, because of lack of coke, the mines would be kept running with nearly the full present force. While little shipping could be done after the smelter and mine ore bunkers were filled, there are spaces in the mines that could be filled with broken ore. Besides this be has development work to be done and this will give a chance to do it, not having air enough, the drills being used almost entirely for breaking ore.

Two drills are being temporarily run by steam in the upper end of the glory hole at the Knoh Hill mine, near Phoenix.

Last week the Mother Lode smelter was blown out, on orders from the head office in New York City, on account of the shortage in the supply of fuel. On M. R. Feeney's claim, the Florence, on the North Fork of Kettle river, \$20 ore was struck last week in a crosscut from the bottom of a 50-foot shaft. The Sunset smelter is still running at Boundary Falls, but expects to blow out as the coke and coal supply is limited and none coming in from Fernie.

A New York and Cincinnati syndicate has bought the J. E. Bate group of claims in Aspen Grove, Similkameen, for \$75,000, and the transfer of two other properties in the camp are reported about to be made.

Work will begin this week in opening up the Eleven of England claim in Stanley by the Cariboo Con. Co. Machinery will be installed, says M. Bailey, manager.

The manager of the Velvet mine, near Rossland, reports returns from smelters—129 tons first-class ore yielded 130 ounces gold, 10,000 pounds copper; net value from smelter, \$2540; 148 tons fines (third-class ore) yielded sixty ounces gold, \$350 pounds of copper; net value, \$1114.

No. 1 mine at Extension, on Vancouver, will be abandoned this month as worked out. The last remaining coal is being taken out.

M. Mackay of Atlin says he will open up the coal field which he has found on the Tatla river, a branch of the Stikine. The outcrop extends for $\frac{1}{2}$ miles. The mine is 10 miles from Telegraph creek and to get the coal out will require the construction of a tramway for that distance.

The management of Le Roi No. 2 Co. at Rossland propose to install a concentrating plant to handle the output of the Josie and No. 1 mines and construction will begin by April 1. The War Eagle and Centre Star mines are also planning additions to their equipment.

The Granby Co. has contracted with the Dunsuir colliery, on the coast, for 200 tons of coke a day to run its smelters at Grand Forks, says J. P. Graves, manager of the company at Spokane, Wash. They had but twelve days supply of coke on hand the 1st inst. The strike situation at the Crow's Nest Pass collieries seems to show no new developments.

The Crow's Nest Coal Co. has sold the stock of general merchandise in the company's stores at Fernie, Michel and Morrissey to a local company, and hereafter the company will devote itself exclusively to coal mining.

The Morrison Mines, Ltd., owning the Morrison mine in Deadwood camp, and the Athelstan mine in Wellington camp, owned by the Athelstan G. & C. M. Co., Ltd., have consolidated, the latter company ceasing to exist as such. Development work on both properties will be started this month. F. H. Oliver of Spokane, manager of the Morrison Co., has contracted to supply the Boundary Falls smelter with an initial tonnage of 50,000 tons per annum, the freight and treatment rate to be \$1.75 per ton, said to be the lowest figure ever quoted in the Boundary district.

A strike is reported on the L. B. group in Trout Lake district. In the shaft on the L. B. claim at 35 feet a 20-inch shoot was struck, 8 inches of which is gray cop-

per, with assay values of \$16 in gold, 300 ounces in silver, 5% copper and 30% lead. The remainder is quartz carrying \$80 per ton. The property is being worked by Superintendent G. W. Stead for Philadelphia men, who also own the Ethel group of three claims.

CANADA.

NORTHWEST TERRITORY.

The Grafton mine, near Whitehorse, north of Atlin, B. C., is producing ten tons of ore a day, being the first regular shipping mine of the district. It is the intention of the owners to install a plant this spring to continue development work and bring their shipments up to fifty tons a day.

MANCHURIA.

According to the Amur Gazette, gold in paying quantities has been found by the Chinese on the banks of the Amur river, opposite the Russian town of Blagovestchensk. The deposits extend for several miles along the river.

MEXICO.

CHIHUAHUA.

M. B. Place, manager of the San Jose M., M. & R. Co., operating at Jan Jose del Sitio, 60 miles northwest of Parral, says they will build 8 miles of railroad from the Gabalana mining district to San Jose del Sitio. The grading of the road, a 3-foot gauge, will be finished next week. Two 20 ton locomotives and twenty-five flat cars will be the equipment. The mill at San Jose del Sitio has forty stamps and handles 250 tons daily. A store is to be put in at the mill when the road is opened up.

The Santa Eulalia mines, at Santa Eulalia, will be developed by M. D. Gatlings of Clarendon, Texas.

There are 40,000 tons of ore being shipped per month from Parral. In addition to this, the Refugio mill is treating 100 tons per day, the Parral M. Co. is treating eighty tons by lixiviation, the Tecolotes mill 200 tons and the Montezuma mill 150 tons. There are four sampling works—the Torreon smelter, No. 25 smelter of Monterey, the American S. & R. Co. and Flynn's, dealing principally with the Mapsmi smelter.

The Guggenheim Ex. Co. is shipping ore from the dump of the Veta Grande mine, near Parral, which runs twenty ounces silver. They are shipping 2500 tons per month from this mine, and 3000 tons from the Quebradillas.

The La Iguana mine at Parral is to resume operations. The pumps were started this week.

The Caballo Prieto silver mine, near Parral, has been bonded to J. P. Hutchinson, of Chihuahua. Work will begin next week.

A. Garcia is treating 3500 tons of ore per month at his lixiviation plant near Parral, and is shipping 2500 tons in addition.

The Hidalgo M. Co., near Parral, is shipping 1000 tons per month from the Moreno mine and 2000 tons from the Presaga.

A. B. Callender, of Torreon, and A. L. Rossin, of Parral, are working the Maria mine, a mile east of Parral, and are down 70 feet.

W. A. Rodgers, manager of the Red Hill mines, near Parral, reports the mill running full capacity.

NUEVO LEON.

A. A. Graham, manager of the Marcoro mine in the Rinconada district, near Monterey, has made the first shipment of ore, consisting of 500 kilograms, which averaged 22% lead.

OAXACA.

The Sierra Juarez M. & M. Co., operating in the Sierra Juarez mountains, 40 miles northeast of Oaxaca, G. Clark superintendent, have their 10-stamp mill in operation and have taken out bullion from the first month's cleanup \$125,000 gold.

The San Francisco mine, in the Ocotlan district, has been sold for \$281,100 to the Los Reyes M. & M. Co. of Perez.

The San Francisco and Candelaria mines, in Ocotlan district, have been sold to Los Reyes G. M. & M. Co. of Detroit, Mich., which company also owns the gold mines of the Pares district, and where they have in operation a 20-stamp mill.

SONORA.

(Special Correspondence)—The Cerro Prieto mines, 35 miles southeast of Magdalena, have been sold to the Nogales C. Co. of Nogales, Ariz., for \$600,000. The Nogales Co. will erect a 100-stamp mill in addition to the twenty stamps now in operation, and also put in a cyanide plant. Enough ore is already blocked out to warrant putting up the plant. The first payment of \$50,000 on the property has been made. They have a vein of gold ore

varying from 15 to 75 feet in width, reported to run \$5 per ton. The property comprises 325 acres. They have an abundance of wood. Have a pumping plant in operation. The pipe line is 3 miles long. C. N. Thomas, Nogales, is general manager.

The St. Bibiana M. Co. of Nogales, Ariz., is operating its property 35 miles east of Magdalena and have broken into the "Antigua" workings, 500 feet in length. The ledge is 4 to 12 feet wide, carrying gold and silver. The company will erect a concentrating plant. They have several tunnels on the property besides shafts. T. J. Byran, president; J. S. Hurst, manager; L. F. Swain, secretary and treasurer.

O. M. Roberts, manager of the Henrietta placer mines at La Cienega, intends putting on a dredger. These placers are located in the Altar district and have produced a large amount of gold and are still producing.

The Sonora M. & M. Co., near Tubutama, are contemplating the erection of a large milling plant. The Onelda G. & C. Co. of Nogales, Ariz., also intend erecting a plant for treating ores.

The Yerkes G. M. & M. Co., J. C. Underwood, general manager, Nogales, Ariz., will have their 20-stamp mill in operation within the next thirty days. Roy & Titcomb are doing the work. They have several shafts on the property, the deepest being 220 feet. The ore mills \$12 on the plates. The mine is located in the Altar district, 35 miles west of the railroad.

Magdalena, Feb. 28.

KLONDIKE.

Dawson reports tell of pay dirt located on Duncan creek, extending from 7 above to 106 above. Numbers 53 and 54 have produced \$100 a day. It is 95 feet to bedrock. No. 106 has 2 feet of pay. The creek would have been worked by heavy machinery this winter but for the failure of the steamer Prospector to reach Dawson last fall with machinery and supplies.

PERSONAL.

F. S. ADAMS, a mining man of Mexico, is in Tonopah, Nev.

C. E. SAVIERS of Seattle, Wash., is in Chihuahua, Mexico.

T. F. MILAND, formerly of Guadalajara, Mexico, is in Tonopah, Nev.

M. KYLE has been reappointed U. S. Surveyor-General of Nevada.

J. McLEOD is superintendent of the Ross Gulch mine, near Sumpter, Or.

J. FITTING is superintendent of the Federal M. & M. Co., near Gillett, Colo.

OGDEN HOFFMAN, M. E., has returned to San Francisco, Cal., from Honolulu, H. I.

P. C. WEBBER of Ely, Nev., a director of the Sapho M. Co., is in Salt Lake City, Utah.

L. REED, manager of the Sahuayan mine, near Chihuahua, Mex., is in Pittsburgh, Pa.

MANAGER J. J. DALY of the Daly-Judge mine at Park City, Utah, is in California.

T. F. SINGISER, manager of the American Flag M. Co. at Park City, Utah, is in New York.

F. H. STANWOOD, of Boston, is examining mining interests in Eastern Arizona and Colorado.

E. C. SMALL of Chicago, Ill., is examining mining interests at Ocampo, Chihuahua, Mex.

JESSE SCOBAY, of Washington, Ariz., is in Denver, Colo., where he will remain for some time.

E. A. BYLER, U. S. Deputy Mineral Surveyor of Cripple Creek, Colo., is in Tonopah, Nev.

L. C. PETERSON is superintendent of the Selma group in North Tintic, near Eureka, Utah.

H. STERN of the Tintic M. & S. Co. is visiting their properties at Eureka, Utah, from the East.

I. E. BUSH is metallurgist and mill superintendent of the Sunshine M. Co., at Sunshine, Utah.

F. H. PERKINS is consulting engineer of the Stockton G. M. Co., operating at Stockton, Utah.

V. M. CLEMENT has returned to Salt Lake City, Utah, from an examination of mines in Mexico.

JAMES KEEN of Kaslo, B. C., has been

elected president of the British Columbia Mining Association.

J. Q. CRITCHLOW of the Cerro de Pasco mines in Peru, is in Salt Lake City, Utah, for a brief vacation.

J. MCSORLEY is manager of the New York Bonanza at Park City, Utah, vice R. G. Wilson, resigned.

P. W. MADSEN, manager of the Century mine at Park Valley, Utah, has returned from a trip East.

W. GUY SCOTT, superintendent of the Black Oak mine, near Soulsbyville, Cal., is in San Francisco, Cal.

J. T. HODSON of Salt Lake City, Utah, manager of the Lincoln mine, near Pearl, Idaho, is in Pearl, Idaho.

W. L. WATTS, E. M., has returned to Los Angeles, Cal., from the oil fields of Santa Barbara county, Cal.

A. A. BROWN of Silverton, Colo., is manager and superintendent of the Stony Pass M. Co., near Silverton.

P. JOHNSON has resigned as general manager of the British Columbia C. Co.'s smelter at Greenwood, B. C.

SUPERINTENDENT F. AMES of the Wauconda mine, near Lead, S. D., is in the East on company business.

R. W. PURDURN of the Belle mine at Thunder, Idaho, has returned from an extended trip to Pittsburg, Pa.

MANAGER F. R. CULBERTSON of San Francisco, Cal., has gone to the Chloride-Bailey mine, Trinity county, Cal.

A. G. LARSON, general superintendent of the Rossland-Kootenay Co., at Rossland, B. C., is in Spokane, Wash.

O. B. TODHUNTER, general manager of the Buckeye M. Co., has returned to Cincinnati, O., from Tombstone, Ariz.

W. I. SNYDER, manager of the California mine at Park City, Utah, has returned from a business trip to Chicago, Ill.

L. HARRIS, manager of the Sunshine M. Co., Camp Floyd district, Utah, has returned to Sunshine from Montana.

C. R. MILLEN of Philadelphia, Pa., vice-president Tonopah M. Co., has been in Tonopah, Nev., for the past week.

J. B. FARISH of Denver, Colo., has been examining the Crestone-Colorado mine at Minas Prietas, Sonora, Mexico.

SUPERINTENDENT J. R. TREGLOAN, JR., of the South Spring Hill mine, near Amador City, Cal., is in San Francisco, Cal.

A. J. ANDREWS, part owner of the Dollie B. mine, near Leadville, Colo., has returned to Montreal, Canada, from Leadville.

L. HARRIS, manager of the Sunshine mines and mill at Sunshine, Utah, has gone East to confer with the company's officials.

A. MOORHEAD is superintendent, Sidney Reeves millman and assayer and J. Keith foreman Echo M. Co., near Mojave, Cal.

DIRECTOR F. ZEITLER of the Champion Mines Co. has returned to San Francisco, Cal., from their mines near Nevada City, Cal.

E. W. CARSON, formerly of New Almaden, Cal., is now superintendent Oceanic quicksilver mine, San Luis Obispo county, Cal.

J. MCKANE of British Columbia, president and general manager Golden Anchor M. Co., is in Tonopah, Nev., looking over his interests.

G. J. CURRAN, president of the Mogollon G. & C. Co., operating near Cooney, N. M., has returned to Denver, Colo., from a trip to their mines.

BRUCE GLIDDEN, formerly general counsel for the Woods Investment Co. of Cripple Creek district, Colo., is now in Tonopah, Nev.

M. B. PLACE of Pittsburg, Pa., manager of the San Jose M., M. & R. R. Co. of San Jose del Sitio, Chihuahua, Mexico, is at the mines.

S. T. PEARSON, manager of the Nevada M. Co.'s mines and mill at Berlin, Nev., made a short trip to Salt Lake City, Utah, last week.

F. P. MILLS, formerly superintendent for the Merced M. Co. at Coulterville, Cal., is superintendent of a coal mine at Robson, W. Va.

F. TURNER, who has been traveling through Sonora, Mexico, the past four months, looking over the mining sections, is now in New York.

R. COE, part owner of the Scorpion group of mines, near Granite, Or., has

returned from Vermont, where he has been spending the winter.

J. T. THOMPSON, superintendent of the Kenross mine at Whiskey Slide, near Mokelumne Hill, was in San Francisco, Cal., for a few days last week.

FRANK FITCH, formerly with Pride of West mine, Washington, Ariz., has charge of the qualitative laboratory at School of Mines, Tucson, Ariz.

E. W. WALKER, formerly chief engineer, is assistant superintendent of the Tombstone Con. M. Co., at Tombstone, Ariz., vice H. J. Gray, resigned.

P. J. QUEALLY, manager of the Kemmerer coal mines, has returned to Kemmerer, Wyo., from an examination of the coal fields of Emery county, Utah.

G. H. ROBINSON of Salt Lake City, Utah, manager of the Tintic M. & D. Co., and D. McViehe, manager of the Bingham Con. Co., are in Denver, Colo.

W. MCCORNICK is in Salt Lake City, Utah, from the placer mines of Siberia operated by his company under a concession from the Russian Government.

J. J. LONG is manager of the Santiago M. Co., owning the Quebradillas mine on the Veta Grande, near Parral, Chihuahua, Mex. R. Long is superintendent.

F. A. KENNEDY of the Cincinnati-Utah Oil Co. has returned to Salt Lake City, Utah, from Duluth, Minn., where he has been spending several months with his family.

F. W. BRADLEY AND H. C. PERKINS of the Mariposa C. & M. Co. and Manager Birch of the Bunker Hill & Sullivan, have returned to San Francisco from Mt. Bullion, Cal.

L. L. PATRICK of Denver, Colo., has taken the general management of the Tonopah Syndicate G. M. Co. of Tonopah, Nev., and also the Plute group at Hanabap, Nev.

J. W. GALLAGHER, former superintendent of the Beaver Con. mines in Beaver county, Utah, has left Salt Lake City, Utah, for the Copper river district in Alaska.

EMERSON GEE has resigned as manager of the California King G. M. Co., and is now consulting engineer for the same company with headquarters at Los Angeles, Cal.

N. DUNYON, former assistant superintendent of the Daly-West mines, Park City, Utah, is superintendent of the Daly-Judge mines at Park City, vice J. McSorley, resigned.

F. M. LOCKWOOD, till recently superintendent of the Accident mines, Cripple Creek, Colo., has been appointed manager of the Gold Cord Co., operating the War Eagle, Cripple Creek.

C. C. BURGER, assistant to J. H. Hammond, is at Tonopah, Nev., examining the properties of the Tonopah Co., to determine as to future working plans and the treatment of the ores.

C. S. FOSSELMAN of Welser, Idaho, manager of the Excelsior Placer M. Co.'s properties in Lewis and Clarke county, Mont., has returned to Welser from a business trip to Salt Lake City, Utah.

G. D. CASE has resigned as superintendent of the Washoe smelters of the Amalgamated Copper Co. at Anaconda, Mont., and has accepted a similar position with the Copper Range Co., near Houghton, Mich.

A. WINSLOW, manager of the Liberty Bell mine at Telluride, Colo., accompanied by Superintendent Bosqui of the cyanide mill of that property, is in Utah, examining the milling methods of the principal camps.

GODFREY D. DOVETON, late metallurgist Thos. F. Walsh's Camp Bird and Camp Bird Ltd., and Chester W. Purlington, formerly of Mining Division U. S. G. S., have formed a partnership as consulting mining engineers and metallurgists, with offices at 319 Majestic Bldg., Denver, Colo.

Commercial Paragraphs.

J. D. HURLEY AND A. B. HOLMES, formerly connected with the Standard Pneumatic Tool Co., are now associated with the Rand Drill Co., in the Imperial pneumatic tool department.

At Seattle, Wash., the Seattle Iron & Steel Co. has incorporated, capital \$6,000,000, to build an iron furnace of 200 tons daily capacity, a 100-ton steel plant and a rolling mill, to work magnetic ores of Texada Island, B. C., and to absorb the

Pacific Steel Co.'s plant at Irondale, Wash.

On May 1st, the Allis-Chalmers Co. will remove their general offices from the Home Insurance Bldg. to the New York Life Bldg., corner of La Salle and Monroe Streets, Chicago—another indication of the progressive spirit which prevails in the management of this strong industrial establishment. The Allis-Chalmers Co. has for the past two years been expending large sums in betterments at their various plants in Milwaukee, Chicago and Scranton, to enable them to give their customers the best possible service in point of economy and quick deliveries. The new offices of the Allis-Chalmers Co. will provide ample space for the various sales departments and general business offices. They write that during the past two months, orders for either engines, mining machinery, rock crushing machinery, sawmill machinery and flour mill machinery were booked from every State in the Union, besides the following foreign countries: England, South Africa, Mexico, Canada, Chile, Central America, Brazil, British Columbia, Bolivia, Hawaiian Islands, Peru, Alaska, China and the Philippine Islands.

PAWLING & HARNISCHFEGGER, Milwaukee, Wis., makers of electric traveling cranes, advise that the sales of their products continue satisfactory. They send reports of sales of fifty-five cranes from Jan. 1 to Feb. 26. Among the orders booked within this time are the following: Chicago & Eastern Illinois R. R. Co., Danville, Ill., three cranes; Western Tube Co., Kewanee, Ill.; Westinghouse Machine Co., East-Pittsburg, Pa.; South Penn. Oil Co., Folsom, W. Va.; Pittsburg Plate Glass Co., Ford City, Pa.; Ansonia Brass & Copper Co., Torrington, Conn.; Fairbanks, Morse & Co., Beloit, Wis.; St. Paul Foundry Co., St. Paul, Minn.; Ingersoll-Sergeant Drill Co., Phillipsburg, N. J., fourteen cranes; American Bridge Co., Ambridge Works, Economy, Pa., five cranes; Standard Steel Works, Burnham, Pa.; City of Boston, Water Department, Boston, Mass.; Beloit Iron Works, Beloit, Wis.; International Steam Pump Co., Laidlaw-Dunn-Gordon Works, Elmwood Place, Ohio; Wheeling Steel & Iron Co., Benwood, W. Va.; Coe Brass Mfg. Co., Torrington, Conn.; McConway & Torley Co., Pittsburg, Pa.; Ironton Engine Co., Ironton, Ohio, two cranes; Joseph T. Ryerson & Son, Chicago, Ill.; Hammond Iron Works, Struthers, Pa.; Cambria Steel Co., Johnstown, Pa.; American Bridge Co., Pencoys Plant, Pencoys, Pa.; C. A. Lawton & Co., De Pere, Wis.; Perry-Mathews-Buskirk Stone Co., Bedford, Ind., two cranes; Toledo Machine & Tool Co., Toledo, Ohio; American Sheet Steel Co., Wellsville Works, Wellsville, Ohio; Landis Tool Co., Waynesboro, Pa., three cranes; Goodman Mfg. Co., Chicago, Ill.

Books Received.

"Analysis, Detection and Commercial Value of Rare Metals," by Dr. J. Ohly, Ph. D., is the title of a little volume of 216 pages, just from the press. It is a treatise on rare metals and their compounds, and is for the use of assayers, chemists and prospectors. Some of the rarer metals treated in this work are platinum, selenium, tellurium, uranium, vanadium, etc. It will prove a very interesting work to those interested in prospecting for these rare minerals and in their properties and uses. Price, \$3; Industrial Printing & Publishing Co., Denver, Colo.

"Elements of Steam Engineering," by H. W. Spangler, A. M. Greene Jr. and S. M. Marshall, B. S. in E. E. This is a book issued for the particular use of students and beginners in the practice of steam engineering. There is little in the book of a theoretical nature, for it inclines to the practical—teaching the use of the various types of steam engines and their accessories, including boilers, boiler room auxiliaries, engine details, valve motions, indicating and governing, condensers, multiple expansion engines, etc. To those taking up this course of study the book will prove of great service. 8vo., 275+V pages, 273 figures. Cloth, \$3; John Wiley & Sons, New York; Chapman & Hall, Ltd., London, England.

Catalogues Received.

Special Circular No. 46 of the Stillwell-Bierce & Smith-Vaile Co., Dayton, Ohio, describes the Smith-Vaile single, duplex and triplex boiler feed pumps, with full-page illustrations from wash drawings and condensed data.

Obituary.

J. V. MOORE, a pioneer and the discoverer of gold in Cook City, Montana, in 1870, died at Gardiner, Mont., March 2, aged 70.

F. C. DOBLER, superintendent of the Cornucopia mine, near Baker City, Or., was killed by a snowslide near the mine on the 3rd inst.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

- FOR THE WEEK ENDING FEBRUARY 24, 1903.
- 721,271.—RULER AND LINE GAUGE.—S. Adler, S. F.
- 721,416.—RAILWAY SWITCH.—W. J. Bell, Los Angeles, Cal.
- 721,537.—ANIMAL TRAP.—Bristol & Eberhard, S. F.
- 721,285.—IGNITER FOR GAS ENGINES.—J. Cereghino, S. F.
- 721,546.—WINDOW SHADE FIXTURE.—D. S. Dow, Seattle, Wash.
- 721,510.—DOOR SILL.—S. W. Funk, Santa Ana, Cal.
- 721,300.—DUMP CAR.—E. D. Haven, San Jose, Cal.
- 721,348.—SAFETY GAS COCK.—Jensen & Christensen, S. F.
- 721,207.—ROTARY PUMP.—J. B. C. Lockwood, Seattle, Wash.
- 721,377.—GRIPPER FOR PRINTING PRESSES.—F. I. Macauley, S. F.
- 721,231.—DOORS.—W. D. Plue, Rainier, Or.
- 721,616.—HAY STACKER.—P. E. Sner, Ellensburg, Wash.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RULERS AND LINE GAUGES.—No. 721,271. Feb. 24, 1903. S. Adler, San Francisco, Cal. This object of this device is to provide a simple compact arrangement for the use of bookkeepers, school children, and others to enable them to draw parallel lines. It comprises a ruler of ordinary description having clamping members thereon, one of said members slides in relation to the other, short foldable graduated arms pivoted on said clamps and adapted to stand at right angles to the straight edge of the ruler, stop means to limit the movement of said arms, and the latter serving as a support for the ruler to keep the straight edge clear of the paper at all times.

SAFETY GAS COCKS.—No. 721,308. Feb. 24, 1903. L. Jensen and J. Christensen, San Francisco, Cal. This invention is designed to prevent the accidental turning on of the gas or the extinguishment of the light without the flow of gas being cut off. It consists in the combination in a safety attachment for gas cocks of a bell crank lever pivoted to the cock, the other end of its arms, a thermostatic bell and snapper, the one end of said pivoted arm, a pivoted member engaging the end of the other arm to form a toggle therewith, a spring arm connected with a gas cock and stop means on the pivoted member of said toggle adapted to engage said spring arm.

ANIMAL TRAP.—No. 721,537. Feb. 24, 1903. W. H. Bristol, of East Highlands, Cal., and G. F. Eberhard of San Francisco, Cal., assigned to The Geo. F. Eberhard Co., of San Francisco, Cal., a corporation. This invention is designed to provide a trap which will be most certain of impaling and holding rodents of all sizes. It consists of a plurality of loops or rings forming an extended passage through which the rodents enter, a spring arm pivoted with impaling teeth movable through the space inclosed by said rings, a trigger pivoted behind the base of the rings, and a trigger plate pivoted rearward of the center of the trap, whereby the entrance of the rodent within the rings is assured before the trap is sprung.

DUMP CARS.—No. 721,300. Feb. 24, 1903. E. D. Haven, San Jose, Cal., one-half assigned to J. H. Crossitt, San Jose, Cal. This device consists in an arrangement of longitudinally supported spiral channels or grooves fitted to each car rollers or travelers adapted to move in said grooves and guided so as to travel in straight lines, and pistons moving in cylinders, with means for applying air pressure to one side or the other of the piston, so that when moved in one direction the spiral will be compelled to follow the rollers, and thus lift the car to a desired level. It consists of a plurality of pistons in cylinders, the ends of the pistons to actuate them and dump the car. The apparatus is controlled by any operator by means of air passages through suitable train pipes.

IGNITERS FOR GAS ENGINES.—No. 721,285. Feb. 24, 1903. J. Cereghino, San Francisco, Cal. This object of this invention is to provide a device of simple construction and positive action and to provide means by which the timing of the explosion may be regulated according to the speed of the engine, so that ignition may take place more or less before the spark reaches the end of the compression stroke. The invention includes a screw-threaded plug fitting the cylinder and having a tapered horseshoe fixed electrode in said plug, a longitudinally perforated conical plug fitting said horseshoe and insulated from the first named plug, an electrode reciprocable in the conical plug, guides by which the electrode is prevented from turning, a plate in which a conical contact plug screws, electro-magnetic means for opening and closing the circuit he wren said electrodes, a disk connecting with the engine shaft, said disk being out of electrical connection with the shaft except for a diagonally disposed conducting segment, brushes engaging said disk, and a switch incorporated in the spark circuit adapted to engage one or the other of said brushes to operate the sparking mechanism.

Latest Market Reports.

SAN FRANCISCO, March 6, 1903.

METALS.

SILVER.—Per oz., Troy: London, 22s 3d (standard ounce, 925 fine); New York, bar silver, 48 3/4c, refined (1000 fine); San Francisco, 48 3/4c; Mexican dollars, 33 @ 38 1/2c San Francisco, 33c New York.

COPPER.—New York: Standard, \$13.00; Lake, 1 to 3 casks, \$13.75; carload lots \$12.75; Electrolytic, 1 to 3 casks, \$13 50 @ 13 75; carload lots \$12.50; Casting, 1 to 3 casks, \$13 30 @ 13 60; carload lots, \$13 00. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £59 15s spot per ton.

Copper has steadily advanced for several weeks past, and Lake copper is now quoted at 13 75c per pound; dealers predict 14c within a short time, as consumers seem to have laid in no stock, evidently hoping for a decline.

LEAD.—New York, \$4.12 1/2; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4 1/2c 1000 to 4000 lbs.; pipe 5 1/2, sheet 6, bar 5 1/2; pig, \$4.75. London: £12 12s 6d per long ton = 2.73c per lb.

SPELTER.—New York, \$5.15; St. Louis, \$4.60; London, £21 15s per ton; San Francisco, ton lots, 6 1/2c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9 1/2c; Hallett's, 8 1/2c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 @ 15c.

TIN.—New York, pig, \$30 6 1/2 @ 31 00; San Francisco, ton lots, 32c; 500 lbs., 32c; 200 lbs., 32 1/2c; less 33c; bar tin, \$3 35c @ 37 1/2c. London, £138 7s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, ingot, \$19 00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$45.50 @ 46.00; large lots: London, £8 15s; San Francisco, local, \$45.00 per flask of 7 1/2 lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6 1/2c; extra, 17 1/2c; genuine, 35c; Eclipse, 37 1/2c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16 65c.

NICKEL.—New York, 50 @ 60c per lb.; ton lots, 45 @ 48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.10; gray forge, \$20.50; San Francisco, bar, 3c per lb., 3 1/2c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

CHICAGO CURRENT QUOTATIONS.

Bessemer	\$24.00 @ 24.50
Foundry Northern	23.00 @ 24.00
Northern 2	22.50 @ 23.50
Northern 3	22.00 @ 23.00
Southern 1	23.35 @ 23.85
Southern 2	22.85 @ 23.35
Southern 3	22.35 @ 22.85
Forge	21.85 @ 22.35
Charcoal	26.00 @ 27.00
Billets, Bessemer	33.00 @ 34.00
Bars, iron	1.75 @ 1.85
Bars, steel	1.75 @ 1.80
Rails, standard	28.00 @ 30.00

Tank	1.75 @ 1.80
Sheets, 26 store	2.80 @ 2.90
No. 27	2.90 @ 3.00
No. 28	3.00 @ 3.10
Angles	1.75 @ —
Beams	1.75 @ —
Tees	1.80 @ —
Zees	1.75 @ —
Channels	1.75 @ —
Steel melting scrap	17.50 @ 18.50
No. 1 railroad wrought	18.50 @ 19.00
No. 1 cast, net ton	17.50 @ 18.00
Iron rails	24.00 @ 25.00
Car wheels	23.00 @ 23.50
Cast borings	10.25 @ 10.50
Turnings	14.00 @ 14.50

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 25 @ 26c per lb.; carloads, 24 @ 24 1/2c; in tins, 35c; soda ash, \$2.00 per 100 lbs.; byosulphite of soda, 2 1/2 @ 3c per lb.; caustic soda, in drums, 3 @ 4c per lb.; Cal. s. soda, bbls., \$1 25 @ 1 50 per 100 lbs; sks., \$1.05; chloride of potash, 12 @ 13c; nitrate of potash, bbls., 8c; caustic potash, 10c in 40 lb tins; borax concentrated, 7 @ 8c per lb.; roll sulphur, 4 @ 6c; powdered sulphur, 2 @ 3c; flour sulphur, French, 2 @ 3c; alum, \$2.00 @ 2.25; California refined, 2 @ 2 1/2c; sulphide of iron, 9c per lb.; copper sulphate, 5 @ 7c; chloride of lime, spot, \$3.00 @ 4.00; sulphuric acid, in carboys, 66% B, 2 1/2c per lb.; nitric acid, in carboys, 8c per lb.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00 @ 22.00; extra sizes higher; redwood, \$22.00 @ 23.00; lath, 4 feet, \$4.25 @ 4.50; pickets, \$19.50; shingles, \$2.35 for

No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @ 32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.35; Cut, \$3.35; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 1/2c; less than one ton, 17 1/2c. No. 1*, 60%, carload lots, 13 1/2c; less than one ton, 15 1/2c. No. 1** 50%, carload lots, 11 1/2c; less than one ton, 13 1/2c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9 1/2c; less than one ton, 11 1/2c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10 1/2c per set; 14 oz., 40s., 9 1/2c.

CEMENT.—Germania, \$2 50 @ 2 75; Hewmoor, \$2 90; Trowell, \$2 90; Portland, \$2 50 @ 2 75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

COAL.—San Francisco, coast, yard prices: Wellington, \$3.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; Lucol oil, hotted, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 22 1/2c; Astral, 22 1/2c; Star, 22 1/2c; Extra Star, 25 1/2c; Eocene, 24c; Elaine, 27 1/2c; Water White, in bulk, 16c; bbl., Mineral Seal, iron bbls., 18 1/2c; wooden bbls., 21c; cs., 24c; Mineral Sperm, cs., 26 1/2c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23 1/2c; 86° Gasoline, bulk, 21c; do., cs., 27 1/2c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22 1/2c; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50 @ 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 50 @ 55c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6 1/2c; in 25-lb. tin pails, 7c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 7c per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6 1/2c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6 1/2c. LITHARGE.—Pure, in 25-lb. bags, 8 @ 9c per lb.

BONE ASH.—Extra No. 1, 5 @ 6c per lb. No. 1, 4 @ 5c.

BORAX.—Concentrated, 7 @ 9c per lb. powdered, 9 @ 12c; fused, 25 @ 30c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c per lb.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5 @ 7c.

MANGANESE.—(90% and over) per lb., \$1.25.

MOLYBDENUM.—25c. per gramme; 1000 grammes=2 1/2 lbs.

CHROMIUM.—(90% and over) per lb., \$1.25.

SODIUM.—Metal, per lb., \$1.25.

MERCURY.—Bichloride, per lb., 90c.

PHOSPHORUS.—(American) per lb., \$1.00.

SILVER.—Chloride, per oz., 90c @ \$1.00; nitrate, 55c.

URANIUM.—Oxide, per lb., \$3.50.

ZINC.—Metallic, chemically pure, per lb., 50c; dust, per lb., 10c; sulphate, per lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

THE CALIFORNIA DEBRIS COMMISSION having received application to mine hydrauic gravel from Calaveras Development Co., in Antella Gravel Mine, near Railroad Flat, Calaveras County, Cal., draining into Independence Creek which reaches South Fork of Mokelumne River, gives notice that a meeting will be held at Room 96 Flood Building, San Francisco, Cal., March 23, 1903, at 1:30 P. M.

The Meaning of Ore.

A general impression prevails that any mineral substance containing precious or base metals in any quantity is an ore. Modern lexicographers have given the word a somewhat more restricted meaning, in which the element of economics is an important consideration. An ore is defined variously by the several recognized authorities, but, generally speaking, is now accepted to mean a mineral substance from which a metal can be extracted at a profit. According to this definition, a mineral containing possibly \$5 per ton in gold, but occurring in small quantity, and in a place difficult of access, might not be considered an ore, for the reason that possibly no profit would result in obtaining the mineral and extracting the gold, while a mineral containing less than \$2 per ton in gold, but more fortunately situated and capable of being treated at a profit, becomes an ore. A change in conditions might make a profit possible in the former case, when that mineral falls into the class of ores. Some object to the expression "gold ore," contending that gold always occurs native, and consequently mineral containing it should not properly be called an ore. As gold does not always exist in the native state, but often in combination with other elements, and as an alloy, the general term "gold ore" seems properly applicable to all minerals containing that metal, with the possible restriction at first mentioned, which appears to rest somewhat upon certain conditions of environment, and combination with other minerals, making its extraction profitless.

Deep Mining on the Rand.

The recent completion of a second deep borehole in the Cinderella Deep mine, on the Rand, in South Africa, upon finding the main reef at a depth of 3309 feet, indicates the remarkable persistence of this gold-bearing blanket. The Turf Club borehole, which reached the same reef at great depth some time since, is 14 miles distant from the Cinderella Deep,

Rotary Kiln, Cement Works, Colton, Cal. (See page 166.)

indicating the probable extension of the sheet of gold-bearing conglomerate over the intervening space. Such generalization elsewhere would not only be unsafe, but would receive no attention whatever from mining men; but the extraordinary continuity of the conglomerate having been proven in other directions on the Rand, makes the assumption not unreasonable that the reef will be found in the intermediate area between the points mentioned. The questions of quantity and value are uncertain, however, and can only be determined by actual exploration, either by means of additional boreholes or by sinking deep shafts to the reef. The recent development in the Cinderella borehole is reported to indi-

cate a width of 16 feet of reef, of which 4 feet assays about \$10 per ton. Should a shaft be started this year to reach the reef at the bottom of the borehole in the Cinderella, allowing no loss of time in preparatory work, and sinking at the maximum speed thus far made on the Rand (Wolhuter, 209 feet in the month of November, 1902), it would be about sixteen months from the date of starting before the shaft would encounter the main reef. No shaft has yet made such an average record, and it is doubtful if the work could be accomplished within two years. It will also entail an expense of several hundred thousand dollars, probably not less for sinking and timbering the shaft than \$100 per foot, on an average,

which will amount to about \$300,000, in addition to the cost of the expensive surface plant necessary in such large undertakings. In some of the deep-level mines of the Rand, whose shafts will be no less than 6000 feet deep vertically, it has been estimated that at least seven years would be necessary to sink the shaft, and develop the mine to the point of production, no matter what the value of the deposit when proven. The expense in these cases is estimated variously from \$2,500,000 to over \$3,000,000, which contemplates the cost of sinking the shaft and opening the levels, the hoisting equipment, mills, all surface works, buildings, and other direct and general expense.

THE Arizona Legislature has passed an eight-hour bill which applies particularly to underground mine workers. The bill as originally framed included also mill and smelter workers, but the clause affecting this class of workmen was stricken out. This bears the stamp of class legislation, and in the event of contest would probably be declared unconstitutional by the highest courts.

FOR the use of the Philippines 75,000,000 silver coins of the denomination of 1 peso will be coined. The ratio of these coins to gold will be as 2 to 1. That is, two silver pesos will have a sustained value equal to a gold dollar. The peso will contain 416 grains pure silver, while a gold peso would contain twelve and nine-tenths grains. It is thought this act, recently passed by Congress, will have a far-reaching effect in the Orient.

THE labor bills passed by the Legislatures of the several mining States making the working day eight hours for all workmen employed underground have been the cause of much comment, and are thought by many to be a species of class legislation and unconstitutional; but the Supreme Court of Colorado has decided that a law of this kind is not unconstitutional, as it might be considered as a sort of police regulation, and that labor underground in mines was calculated to be injurious to the health of the workmen, aside from its dangers, and calculated to shorten his life. An attempt was made in some States to extend the operation of the law to workmen at smelters and mills, but failed to pass. It is unlikely that the present attitude of the court would be changed in the event of legal difficulty over the enforcement of the new law.

Decision in Argonaut-Kennedy Case.

The United States Supreme Court has decided the long-continued litigation between the Argonaut M. Co. and the Kennedy M. Co. of Jackson, Cal., in favor of the former company, affirming the judgment of the Supreme Court of California. The case is a most interesting one, and involved the extralateral right question, which is such a fruitful source of litigation. These mines adjoin and are situated on an important vein locally known as the Mother Lode. Both claims were located prior to the passage of the mining laws of May 10, 1872, and patents were applied for by both companies prior to that date, though the patents did not issue until later. An important feature in the contention was the relation of end lines to extralateral right. The end lines of the Argonaut—originally the Pioneer mine—diverge in the direction of dip. For this reason the Kennedy Company claimed that the Argonaut was entitled to no extralateral right. As the claim was located under the laws of 1866, and as patent was applied for and certificate issued under those laws, the Argonaut Company insisted that as the laws of 1866 did not require parallelism of end lines as a pre-requisite to extralateral right, they were entitled to follow their vein on its dip to the extent of planes drawn vertically downward through their end lines in the direction of dip. The drawing, page 169, will serve to illustrate the situation and contention of the two companies.

The ore bodies in dispute were within the extended end lines of the Argonaut—that is, south of the north-end line of the Argonaut and underneath the Silva quartz mine, owned by the Kennedy Company. This claim was located twenty years after the entry of the Pioneer or Argonaut claim. These ore bodies were reached by the Kennedy Company through drifts run south from this south shaft sunk within the Kennedy millsite. Only a relatively small portion of the Kennedy workings were in the disputed area. The contention of the Kennedy Company was that the end lines of the Argonaut were not parallel, and consequently they were not entitled to extralateral right, and that even if the laws of 1866 did not require parallelism of end lines as a pre-requisite to extralateral right, the owners of the Argonaut mine, having accepted a patent issued after the passage of the act of May 10, 1872, which did require the parallelism of end lines, they were bound by the provisions of that law; that if, notwithstanding the non-parallelism of the Argonaut end lines, the extralateral right were not denied, such right should be defined by drawing a plane parallel with the south end of the Argonaut claim, that being the initial point of survey. The contention of the Argonaut Company was that the patent to the claim originated under the laws of 1866, and this act did not require parallelism of end lines, and furthermore that the act of 1872 granted to the owners of locations made prior to that date the right to follow their veins downward between the end line planes as they then existed. C. H. Lindley, for the Argonaut Company, claimed that if the court was to construct end lines, the end lines must be drawn perpendicular to the strike of the vein, citing as a judicial precedent the Eureka case. The application of this theory would give to the Argonaut Company all the ore bodies in dispute and more.

Judge G. W. Nicol, of Tuolumne county, Cal., tried the case and rendered judgment in favor of the Argonaut Company. An appeal was taken to the Supreme Court of California, which affirmed the decision of the lower court. The case was carried to the Supreme Court of the United States on a writ of error. A motion was made by counsel for the Argonaut Company to dismiss the writ for want of jurisdiction. The motion, and the case on its merits, were argued twice. The decision in favor of the Argonaut Company was written by Chief Justice Fuller, White and McKenna dissenting. J. Garber and J. M. Wright were counsel for the Kennedy Company.

In the course of mining operations the Kennedy Co. extracted a portion of the ore from the disputed ground, continuing until enjoined by the Argonaut Co. The injunction was obtained about eight years ago, since which time this wedge-shaped section has remained untouched by either party. In the mean-

time the Argonaut Co. have sunk a three-compartment shaft to a depth of nearly 2000 feet and have stoped ore on several levels up to the disputed line. The value of the block in question is estimated at no less than \$2,000,000, beside which the damages claimed by the Argonaut for ore already extracted seems merely nominal. The two companies agreed by stipulation that the amount of this damage—the result of two separate trespasses by the Kennedy Co.—should be \$56,099.

Labor Troubles in Mines.

As may have been anticipated, the strike difficulty at the Mountain Copper Company's works at Keswick and Kennett, Shasta county, Cal., was not permanently settled when the union men early in February were obliged to go to work with non-union men or not work at all. Their ideas and methods do not permit such a condition long to prevail. The trouble has broken out afresh and the smelter is running about one-third of its capacity, with little immediate prospect of doing better, as men are not being readily obtained to take the places of the strikers.

It is reported that delegations of strikers hoard trains going north and south in the vicinity of the mines and persuade those who have any intention of going to Keswick to offer their services, to move on and make no application for work. As a result, there are few applying at the company's office. It is asserted that unless the trouble is promptly adjusted the entire property will be closed down, and no attempt will be made to operate either mine or smelter. As before, this will mean the shutting down of several other mines in that county, which have heretofore been supplying siliceous gold ores to the smelter, thus working a great hardship on the entire mining industry in the vicinity of Keswick and throughout northern California. Manager Lewis, of the Western Federation of Miners, who was recently a visitor at Keswick in the interest of the miners, is now heard from in another locality—at the Golden Eagle mine on Hayden Hill, Lassen county, Cal., 50 miles from the nearest railroad point. Fifty men are employed at good wages and with reasonable hours for labor. If they were dissatisfied with their condition, no intimation that such is the case has been given out, but upon the advent of Manager Lewis, a union was organized and when it was considered that the organization was sufficiently strong, the demand was made that none but union men be employed.

California is not alone the scene of labor difficulties. In South Dakota, at Deadwood, the smelter crew of the Deadwood & Delaware smelter, owned by the Golden Reward Co., went on strike, it is reported, because several men who had been employed on special extra work for a few days were paid off and dismissed when their work was completed. These men were members of a union and it was decided the company could not thus summarily discharge men whose names had been entered on the pay roll. As a result, several hundred men were laid off at the mine, as with the smelter closed no ore was required at that branch of the company's works. As a further result, it is stated that the company will not reopen the smelter, but will ship the ore to Omaha for reduction. As a consequence of this strike, about 1000 men are idle.

In British Columbia there has been labor trouble for some weeks past at the several coal mines, and a shortage of coal and coke has seriously affected the metal mining industry in that province. The management of the Wellington properties has ordered a portion of their mines closed at Nanaimo, it is reported, as a retaliatory measure upon the miners, 1000 in number, for joining the Western Federation of Miners.

THE recently organized British Columbia mining association has petitioned the Provincial Government to submit mining legislation to the association for consideration before its enactment, in this manner hoping to get only such laws passed or amended as may seem of the greatest benefit to the industry. The association has also agreed to refrain from the discussion of social problems and that the organization shall be entirely non-political.

CONCENTRATES.

MINORS born in the United States are citizens and may locate mining claim. There is no requirement of the general law that the citizen shall be of any certain age.

THE mineral specimen sent from Tesla, Cal., is a piece of wood which has become silicified, and is commonly known as "petrified or opalized wood." It is abundant in the ancient river channels of California.

WHERE obtainable at a cost not lower than that of new timber and lumber, it is economy to buy remnants of timber and lumber for use as blocking in timber sets in mines. The amount of waste in framing timbers is often insufficient to supply the demand for blocks, etc., and frequently large timbers are cut for blocks only.

TELLURIDE ORES do not occur abundantly, though more common than was supposed a few years ago. In some of them the gold is not native, but a comparatively low heat usually suffices to reduce the gold to metallic form, when the rock may be "prospected" in the usual way, by crushing and washing in a pan or horn spoon.

ROCKS are not always easy of determination in the field unless one has a thorough knowledge of rock classification, and this is only obtainable by a long and systematic course in microscopic petrography and chemistry. Rocks which seem alike to the inexperienced observer may be very different in composition and origin.

COPPER AND BRASS PIPES may be bent without damage if the pipe be filled with sand. Recently coils of steel springs have been substituted for the sand with satisfactory results, but the use of the steel spiral spring requires more mechanical skill in its manipulation, and sand is usually available where suitable springs may not be.

THE principal chemicals employed in the Permanganate process are permanganate of potash and sodium chloride (common salt). The process was patented by Dr. Black about 1899, and subsequently introduced in New Zealand and Australian Colonies. It is fully described in the MINING AND SCIENTIFIC PRESS in the issues of April 6, 1901, and Feb. 28, 1903.

WHEREVER work is done by the use of heat, an amount of heat disappears equivalent to the amount of work performed; and whenever mechanical energy is spent in generating heat, the heat so generated is equivalent to the energy so spent. It is impossible for a self-acting machine, unaided by external energy, to convert heat from one body to another of a higher temperature.

TO DEODORIZE PETROLEUM mix chloride of lime with the petroleum in the proportion of 3 ounces to each gallon of petroleum; place in a cask; add muriatic acid; agitate the mixture so as to bring all the liquid into contact with the chlorine gas. Then pass the petroleum into another cask containing slaked lime, which will absorb the free chlorine and leave the petroleum deodorized and purified.

THE purple rock specimen from near Indian Guleb, Mariposa county, Cal., is pyrophyllite, a variety of foliated aluminous talc. The color is due to oxidation of iron minerals. The normal color is slightly greenish, silvery white. The radiated structure is due to crystallization. It has small commercial value, principally as hand specimens for cabinets. The black specimen is mica slate, containing crystals of chloritoid, an aluminous silicate. It is probably the result of contact metamorphism.

IT has been stated that a single leather belt, 1 inch in width and running at the rate of 800 feet per minute, will transmit 1 H. P., but authorities differ. Some say it requires a speed of 1000 feet per minute and others place it as low as 600 feet; but experiments carefully conducted indicate that 800 feet is near the proper speed. A double leather belt, at a speed of 800 feet, will transmit 1½ H. P. per inch of width of the belt, when both the driving and driven pulley are the same size and giving 180° of belt contact on each.

AN alien may make a mining location and dispose of it, providing he becomes a citizen before disposing of the mine, and the buyer, if he keeps up the monuments and performs the assessment work required by law, may acquire title to the claim. The Colorado Supreme Court has also decided that an alien upon declaring his intention to become a citizen of the United States, in the absence of any intervening rights, may have the advantage of assessment work previously done, and records previously made by him in locating a mining claim on public mineral land.

THE old screens, nails, bolts and other pieces of iron and fragments of copper plates, detonating caps, etc., recovered from stamp batteries, may be cleaned by burning the same in a furnace together with the chips of wood, consisting of pieces of wedges from the boss-heads and chips from the mine, which are removed from time

to time from the mortar, and the ashes after screening cleaned up in the clean-up barrel or pan with quicksilver. The furnaces should have a grate, but in absence of a furnace the same may be burned on the ground. In this way most of the gold may be recovered.

MAGNESITE (carbonate of magnesia) is a white, grayish-white to yellowish mineral. Hardness, 3.5 to 4.5. Usually massive, sometime fibrous, transparent to opaque. Luster vitreous. It contains, when pure, carbon dioxide 52.4% and magnesia 47.6%. Iron carbonate is often present. It is generally found in talcose schists, in serpentine, and in other magnesian rocks. It occurs in several counties of California, also at Bolton, Mass., near Baltimore, Md., Chester county, Pa., and elsewhere. It is used extensively in the manufacture of fire proofing, steam pipe covering, etc.

THE law does not recognize mining as a public utility and the right of eminent domain cannot be exercised in connection with mining operations, unless such operations are clearly a public benefit. The fact that mining in a general way is beneficial to the community and the State in which the operations are conducted is recognized, but the benefit must be of a more direct nature than this. One cannot build a pipe line or flume over the land of another without the consent of the owner, and the builder of an aerial tram may not even string a wire over the property of another, though the towers supporting the rope may be constructed on the land of the person building the tramway.

DIABASE is a coarse to fine grained, and usually compact greenish compound of plagioclase, augite, and generally viridite, with specks of ore (magnetite mostly) and accessory biotite, rhombic pyroxene, olivine and occasionally quartz. It occurs in many mining regions, and is often associated with important gold mines. The greater portion of the greenstone schists in the California gold belt are not the result of the alteration of intrusive dikes of diabase, but of sheets of ancient andesitic tuff which were deposited contemporaneously with the slates. The dikes of diabase were mostly intruded subsequent to the folding of these beds, and are usually not altered to a great extent.

CYANIDE, CYANITE AND SYENITE have nothing in common. Cyanide is the name usually given to the cyanide of potassium; cyanite, or kyanite, is a baso meta-silicate, containing alumina, silica and oxygen. A variety is found in the Cargo Muchacho mountains, San Diego county, Cal., containing lime. It is blue along the center of the crystals and whitish at the edges. It is also gray, green and black. The hardness varies from 4 to 7.25. This differs on the several faces of the crystals. It is found in gneiss and mica schist. It is sometimes associated with the occurrence of corundum. Cyanite is also called disthene. Syenite is a rock resembling granite, being, in fact, a granitoid compound of potash feldspar and hornblende (sometimes mica or augite), without quartz.

QUARTZ SCHIST is a foliated quartzite, usually with some mica, generally white. It contains a high percentage of silica, but with sufficient mica to give the foliated structure. It sometimes contains gold. Mica schist and mica slate are similar to quartz schist, but contain less silica. Mica schist contains more mica than quartz schist, and mica slate has a slaty cleavage not foliated. These latter also are known to be gold bearing in some regions, particularly in regions of old crystalline rocks, when quartz lenses and veins occur containing gold. The accompanying schists often form a zone of mineralization within which the lenses and veins of quartz occur the entire width of the zone (greatly varying and irregular in distribution of values), is gold bearing. Zones of this character usually have no defining walls.

THE term "porphyry" is the most used of any name given by miners to rocks of unknown character. They are familiar with slate, quartzite, limestone, etc., and often with greenstone as a class distinctive from the former, and call most crystalline rocks of grayish appearance and granitic habit by the general name granite, whether proper or not; but any rock of unknown character is called porphyry, particularly if it is fine-grained, more or less decayed and generally unlike the type rocks above mentioned. The term answers well enough, as a misnomer has no particular significance. Porphyry is a term describing a structural condition in rock and has no particular reference to its mineral composition, excepting as indicated by some qualifying adjective, as quartz-porphyry, meaning a fine-grained rock in which occurs crystals or blebs of quartz, also, sometimes, of feldspar (orthoclase) and mica or hornblende. Hornblende porphyry is a rock of granitic type in which hornblende occurs in prominent crystals. Feldspar porphyry is the name applied to a fine-grained grayish rock in which feldspar crystals are prominent.

RADIUM is not found in the metallic state; only its salts have been obtained from pitchblende and other uranium minerals. The chloride is the most remarkable producer of Becquerel rays yet found, its activity ranging—according to its purity—from 300 to 1,000,000 times that of uranium. The radiations are luminous, but differ from light; they affect a photographic plate, they set up phosphorescence in other substances, they burn the skin and destroy bacteria. Some of the rays are detected by a magnet and others resemble x-rays, and

change oxygen to ozone. It is estimated that 5000 tons of uranium residues would not yield two pounds of radium. In three years the production of radium salts has been only a pound and a quarter, and the only chemically pure radium chloride in existence is a specimen weighing half a grain, which the owner, Prof. Curie, says cannot be bought for \$20,000. Similar tiny specimens contaminated with barium can be had for \$5000 each, while lower grades are on the market at \$4.50 to \$100 per gram. Even if a store of radium should be found the extraction of the substance will be a great difficulty, as merely to enter a room containing two pounds would probably destroy the sight, burn off all the skin on the body, and quickly kill.

CONCERNING side-end lines, "Lindley on Mines" says, Sec. 367: "End lines are not always those which are designated as such by the locator. If the vein does not cross the line called by him an end line, it is not in law an end line. In such case it performs the mere function of a side line. In all cases where a vein crosses a side line, the side line performs the function of an end line. We call it a side-end line for descriptive purposes. Whether the side-end line performs the function of an end line for the purpose of determining the extralateral right, will depend upon circumstances. Where the vein crosses the side lines, where the crossed side lines are parallel, we do not see why the vein should not be followed on its downward course throughout its entire depth, between vertical planes drawn downward through the side-end lines, produced indefinitely in their own direction. If the side-end lines are not parallel, and the dip of the vein is toward their convergence, these lines may be extended in their own direction until they meet, and the locator may pursue the vein in depth to the vertical line of junction between the two planes. If the dip is in the direction of divergence, there would certainly be no extralateral right."

A PIPE LINE crossing a gulch or valley and conveying water from one hillside to that opposite is often called an inverted siphon. This is a misnomer, but the use of the word is generally understood. A siphon, technically, is a bent pipe having unequal branches, open at both ends, and is used to convey water from a higher to a lower level, the water passing over an intermediate point higher than the level of the water at either end. The limitations of the siphon are determined by the pressure of the atmosphere and the friction in the pipe line. The greatest height over which water can pass when employing a siphon is about 33 feet, but it is always less, owing to the conditions above stated. To make a siphon operate in draining a reservoir or mine each limb should be provided with a valve. That on the lesser end must be a short distance below the surface of the water. That on the longer end must be placed lower than the lowest point from which it is expected to raise the water. A third valve must be provided at the summit of the bend with a means for pouring water into the pipe through the valve at that point. The end valves being closed the pipe is filled at the bend. When full close the valve at this point and open the valve beneath the level of the water on the short end; then open the valve on the long end. If the air has been excluded the siphon should continue to work until the height of the column of water between the surface of water in the reservoir and the summit of the bend equals the atmospheric pressure.

QUARTZ occurs in many forms: as a granular constituent of fragmental rocks (sandstones, etc.), as a necessary component of many primary rocks, especially metamorphic schists, granite and gneiss; also in the form of crystals or blebs in many eruptive and intrusive rocks, but when a miner refers to "quartz" he usually is understood to mean that form of the mineral found as an independent rock in veins, and distinctly different from the walls of the vein. In this form it is massive, white (unless colored by mineral oxides), glassy or dull, transparent or opaque. It has great variety of appearance, but may usually be recognized by its hardness—scratches glass readily. Quartzite is composed almost wholly of quartz, but it is granular in structure, and occurs in beds. These beds may lie as originally deposited—horizontally—but may have been tilted subsequently. Most quartzite was originally sandstone which has subsequently been consolidated into a hard, compact rock by the infiltration of crystalline silica. Sometimes the grains are so fine as to be indistinguishable without the aid of a strong lens. Quartzite that has undergone this silicification sometimes resembles massive quartz to such an extent that its granular structure is only apparent under the microscope. From the above it may be concluded briefly that "quartz" is a massive form of silica and "quartzite" a granular form of the same mineral. Diabase is one of the basic rocks known more commonly as "greenstone." It is a coarse to fine-grained greenish compound of feldspar (plagioclase) and augite, with iron ore in grains (magnetite) and other less common minerals not essential to the rock. "Porphyry" is a term applied to rocks in which some mineral appears in distinct crystals, larger and more prominent than the general makeup of the mineral. This finer grained portion is referred to as the "ground mass." There are many kinds of porphyry, distinguishable by the particular mineral which appears with porphyritic structure, as "quartz porphyry," "hornblende porphyry," "feldspar porphyry," etc. Miners indiscriminately call any decomposed, eruptive rock porphyry, but the term is often misapplied.

Hydraulicking in the Nome Gold-fields.

Written for the MINING AND SCIENTIFIC PRESS by OTTO HALLA.

The first experiment in hydraulicking in the Nome region was made in the summer of 1901 by Leland, Davidson & Bliss, who had a "lay" on No. 1 and No. 2, on Snow gulch, a tributary of Glacier creek, a small ravine without sufficient water for a sluiceway, and, to be able to work it during the summer months, they resolved to get the water from the head of Glacier creek, about 5 miles distant. Work was commenced and everybody wondered if they would not lose all the water by leakage, and experienced miners advised one of the parties to the undertaking to save his money, for the reason that "the mud and moss will never hold the water." In spite of the ill forebodings the work was pushed to completion at an expense of about \$1000 per mile, and proved to be an immense success. Before the season of 1901 ended the parties had cleared above all their expenses the sum of \$50,000. This stimulated the desire on their part to extend the ditch system, if possible, and get all the water available from the Nome river. The topography of the Nome river section was favorable to the execution of this plan, and a survey revealed the fact that a ditch could be constructed to Hohson creek, where 3000 inches of water were available, to the divide between Glacier and Anvil creeks, and at the same time around King mountain to Dexter creek. This would bring the water to the most desirable section of the Nome region. Accordingly, in the fall of 1901 and summer of 1902 work was pushed on the undertaking by the Miocene Ditch Co., comprising the above-mentioned men, and a ditch constructed 27 miles in length, with a minimum capacity of 3000 inches. The work was successfully completed in the late summer of 1902, and for the first time in its history Dexter creek had enough water to be worked from the head to its confluence with Nome river. Dexter creek was a continuous street of tents, and miners were busy day and night for the last thirty days of the season. The ditch system had to embrace Anvil creek, and for this purpose a tunnel of about one-half mile length is being constructed from Snow gulch to Anvil creek, to supply that stream with water.

Meanwhile, C. D. Lane's enterprise, the pumping station, was under construction since early in 1900, to convey water in 24-inch pipes to Anvil mountain, to be used for hydraulicking Lane's claims on Anvil creek and Neckkila gulch. The plant was completed in the fall of 1902, at an expense of \$500,000 and was successfully used the balance of the season on Anvil Creek and Cooper's Gulch claims, which could not be worked previously for lack of water. Another enterprise has been commenced by C. D. Lane, on Ophir creek in the Council district. A ditch, 6 feet at the bottom, 10 feet on top and 6 feet deep, was commenced, reaching from the head of Ophir creek to his No. 15 above, a claim which has already produced more than \$750,000. This ditch is cut in rock in the canyon and only half finished. When completed it will have cost about \$250,000. The work on this ditch gave employment to about 1000 men all last summer, and will employ next season the same number of men.

The Topkock ditch was started last fall and is partly finished. It will be more than 20 miles long and will supply water to Daniels, El Dorado, Rayn and other creeks. The Solomon River ditch was surveyed last summer and work started late in the season. It will start at Big Hurrah and convey water to the Solomon river benches and reach on as far as Rock creek.

A ditch has been surveyed from the head of Nome river, taking in all the tributaries of Nome river as far as Dorothy creek, work to be commenced early next spring.

A ditch has been surveyed from Stewart creek, a tributary of Sinook, to convey water to Irish hill, on Green gulch, a tributary of Sinook river.

A pumping plant will be constructed at the mouth of Dexter creek to pump water to Dexter and Dry creeks, to compete with the Miocene Ditch Co. A ditch has been made from the mouth of Oshorn to some Nome benches about 6 miles below, and a number of other ditches have been planned all over the Nome goldfields, to be constructed at the beginning of the season of 1903.

With the return of confidence, a large amount of capital will be invested in the Nome goldfields in such improvements, and the output of gold will justify it. The area of auriferous gravel on the Seward peninsula is very extensive. It may be distributed in such quantities, however, that it would not pay to handle the ground with the old system of pick and shovel, but where a giant will do the work of 100 men the returns will be proportional.

Actual hydraulicking was done in the season of 1902 only on Snow gulch and Glacier creek, an elevator having been in use on the latter place. The success achieved and the simplicity of working has demonstrated this to be the only satisfactory method of handling this vast area of ground.

There is no doubt that many stock companies will be organized with a view of operating ditch systems

in the Nome region, and some will be legitimate operators. The majority will exist by reason of the good results obtained by the legitimate enterprises. This, however, will not in the least change the result. That hydraulicking will henceforth be the chief method in working the Nome goldfields is established.

Nome, Alaska, Dec. 10, 1902.

Mining in Mexico.

The Republic of Mexico is credited with the production of about \$3,000,000,000 in silver. So great

Statistics for 1901-02 are not yet issued, but the gold output is estimated at \$12,000,000.

Mexico as a mining field is attracting constant attention and the industry will continue to prosper and expand under modern methods.

The accompanying illustrations are of two properties in the State of Sonora, a few miles below the international boundary.

The Flashing Point of Oil.

When the vapor from illuminating or other oil is mixed with air, the mixture will not explode until the

SANTA ROSA STAMP MILL AT SANTA ROSA

LA MINA BUFO, SAHUARIPA DISTRICT

has been the output of this metal that the fact that Mexico has other mineral resources has been largely overlooked and neglected.

Official statistics recently compiled in Mexico show that the production of gold is large and on the increase. Following are the figures showing production from 1890-91 to 1900-01:

	Gold Value.
1890-91.....	\$920,702
1891-92.....	1,074,637
1892-93.....	1,269,907
1893-94.....	1,244,621
1894-95.....	4,744,542
1895-96.....	6,085,038
1896-97.....	6,861,126
1897-98.....	7,584,182
1898-99.....	9,346,541
1899-00.....	7,823,701
1900-01.....	9,327,542

proportion of vapor to air has reached a certain amount that varies with the nature of the vapor, says W. S. Franklin in his notes on "Elementary Mechanics." Thus, 1 part of acetylene to 25 parts of air is an explosive mixture, while a much larger proportion of gasoline vapor is necessary to produce an explosive mixture. Thus, the air in a vessel containing also some volatile oil, like kerosene, soon becomes saturated with the oil vapor, and, if the temperature of the mixture is slowly raised, the proportion of oil vapor increases until at a certain temperature the saturated air becomes explosive. This temperature is known as the "flashing point" of the oil. An oil to be safe for use in lamps must have a high flash point, and the law requires that the flash point of commercial kerosene shall be above a certain minimum temperature. With proper care, most anyone may determine the flash point of ordi-

nary oils. The oil to be tested should be placed in a tin vessel having a lid that fits closely but also loosely over the top of the can, and care must be taken to get no oil on the outside of the can or cover. Have a flat board handy, so that if the oil should take fire the flame can be smothered by removing the cover and placing the board close over the top. The lid for the can should have two holes, through one of which a thermometer with the scale etched directly on the glass is placed. The thermometer is used to indicate the temperature of the oil. Let us suppose that kerosene is to be tested. Fill the can about half full of the oil and slowly warm it. For this purpose an iron tripod stand and a hunsen burner turned down low is most suitable. The lowest temperature of the oil is to be observed, for which the enclosed mixture of air and vapor flashes when a lighted taper is applied to one of the holes in the lid. To determine this point for kerosene, watch the thermometer until it reaches about 50° C. or 122° F.; then apply a lighted taper at the opening in the lid. If the vapor does not flash, continue to heat it slowly until it does. Note the temperature of the oil when it flashes. Then remove the source of heat and apply the lighted taper every time the thermometer drops 5° C., or 9° F., until the flashing ceases. This gives the lowest flashing point.

The determination of the lowest temperature at which air saturated with an oil vapor will flash is a tedious operation, inasmuch as the vessel must be heated very slowly, in order that the enclosed air may be continually saturated. In commercial testing, a vessel of standard size is heated at a somewhat rapid rate by means of a lamp of standard dimensions, and the temperature of the oil at which flashing first occurs is the commercial flash point.

The Permanganation Process.

TO THE EDITOR:—In D. F. Meiklejohn's article on Dr. Black's permanganate process in the MINING AND SCIENTIFIC PRESS of Feb. 28, 1903, he compares that process with the chlorination process, rather to the detriment of the latter.

While Mr. Meiklejohn does not say so, he leaves his reader to infer that the chemicals employed cost about 30 cents per ton of tailings worked. According to my latest quotations, the supplies he uses will cost 26½ cents in San Francisco, and the freight to the Sierra Buttes mine will certainly double that, making them cost 52½ cents per ton of tailings. Then he says he extracts \$6.10 per ton and also lets the reader infer that that is 50% of their value, or they are worth \$12.20 per ton.

In August, 1898, a sample of these same tailings was sent me and they assayed \$18.60 in gold and 2.10 ounces in silver per ton. Two other sources give the same value, though I can not vouch for the accuracy of the sample. E. W. Herrin, superintendent of the chlorination works at the Gold Bank mine, Forbestown, Cal., worked these tailings in the laboratory by chlorination, and succeeded in extracting \$9.30 of the gold and 1.55 ounces of the silver. He estimated the cost of the chemicals at 35 cents per ton, based largely on the actual experience of handling eighty-five tons of chlorination tailings, which we did here at about that time. The labor would be no greater in handling the tailings for chlorination than for Mr. Meiklejohn's present practice, and the time for leaching would be very materially lessened. The extraction by chlorination shows an increase of \$3.20 over Mr. Meiklejohn's, or over 52% greater extraction. I have never failed to obtain higher results in actual practice, on a large scale, than in the laboratory. The extraction of the silver would more than pay for the chemicals used, and there is always a certain amount of gold extracted by the silver leach, hence the advantage of leaching for silver. The harrel chlorination is the method I use, the chemicals being chloride of lime and sulphuric acid. A high pressure is obtained in the harrel, which is hermetically sealed, and revolved, the revolving of the ore keeping the particles of gold bright and by constantly rubbing off the chloride of silver formed exposes clean surfaces of the gold to the action of the chlorine gas.

Certain it is that if Mr. Meiklejohn's experiments have taught him to draw the deductions he does in the beginning of his article as to the forms the gold is in in the chlorination tailings, it is a severe criticism of the men who originally did the work, and shows conclusively that they did not understand their business.

One last word in comparison of the two processes. The permanganate process was tried in Angels Camp on newly roasted ore, where the chlorination process was in operation, and the extraction was not as large as by the chlorination and the expense greater. The permanganate process was under direct supervision of Dr. Black, as I remember it. The above statement was made to me by the manager of the mine where the experiment was made and corroborated by the superintendent of the chlorination works. I have every reason to believe the process was given every show, as it was the desire of the management to lessen the cost of working the sulphurets, no matter how little. H. P. Stow.

Forbestown, March 7.

Mine Sampling on the Main Reef.*

By D. J. WILLIAMS, Johannesburg, S. A.

In sampling development drives, it is necessary first to decide upon some uniform interval between the sections; and upon the actual method of sampling the reef. We arrive at a decision upon this point by the consideration of the width and nature of the reef or leader that we have to sample. For reefs of moderate width, a section every 10 feet is generally considered sufficient; it is only in the case of very small reefs that it is thought advisable to reduce this distance; and experience shows that 5-foot intervals give satisfactory results. In the case of an extremely narrow reef, it is best to take small chips over its entire length, parcelling 5-foot lengths into separate bags.

Where the value of the reef is extremely irregular, the triangular or zig-zag method has been found to give satisfactory results. To apply this method the sample is composed, not as ordinarily of a mass of reef taken from the face at the 5 or 10-foot intervals, but of small chips taken from a zig-zag line extending across the whole 5 or 10 feet, the line of chipping being previously chalked along the reef. This method is calculated to give a fairer average sample than the intermittent method, but it is, of course, more laborious, and in some cases difficult to apply, owing to the irregular character of the rock face. In addition to the sampling of the development ground being most carefully carried out and recorded, it is undoubtedly important that notes should be kept of characteristic geological features in the mine, and of diamond drill cores, with cross-sections obtained.

A good method during development, provided the face is washed down and properly squared up, is to take small chips, in equal quantity if possible, from the whole face of the reef, having a cloth spread out to receive them. If the reef is large it should be divided up accordingly. The squaring up of the face entails some work, but if more care and time had been given to this mode of sampling in the past, much needless driving would have been avoided on many mines. Leaders have been missed in the foot, through the face not being properly squared and washed down.

Where, as is often the case, several leaders are laid bare in the side of the drive, each is sampled separately.

The practice of sampling the partings as well as the reefs, and thus obtaining the average value over the whole area, has been abandoned on the Rand. The size and weight of the samples are thus reduced, and the operation expedited. In cases, however, where the width of the reef is very small, not more, say, than 3 inches, it is advisable to include a small quantity of quartzite on either side, say 1 inch. This ensures securing all parts of the reef in the sample. The sampler, however, must be careful to include the quartzite in the measurements, and to strip the quartzite to the same depth as the reef. The latter being more friable, he is tempted to neglect this operation. It is, however, important to sample the interstratified quartzite separately at various points, especially where the line of demarcation between the true conglomerate and encasing matrix is difficult to trace. The quartzite underlying the South Reef in the Roodepoort district, that between the various leaders of the Main Reef in the Central Rand, and the quartzite and the coal seams in the Buffelsdoorn district, all carry gold. Sampling the quartzite will also help to detect any mixing of the samples underground, in the sampling room, or in the assay office, for if the quartzite is reported to carry gold in appreciable quantities, the reasons require investigation.

In sampling wide reefs, experience has shown that it is advisable to divide them up into sections. Say, for instance, we have a reef 36 inches wide, we would divide it up into three sections.

Great care should be taken if large pebbles appear in the lower portion of the reef or elsewhere within it, to sample them separately; for I have noticed often that most of the gold is located in the vicinity of these pebbles, the other portions being usually comparatively poor.

Having decided what methods to pursue, the sampler prepares for work by furnishing himself with the following equipment:

- (1) A measuring tape divided into feet, preferably 30 or 50 feet in length.
- (2) Clinometer.
- (3) Two light slide staffs.
- (4) A four-pound hammer and a stock of moils or chisels having an edge about ¼ inch wide, the ordinary sampler's pick being useless for this class of work.
- (5) A fairly large piece of cloth, or an old panning dish, which serves admirably to catch the sample.
- (6) A pot of paint of a color different from that used by the surveyor.
- (7) A strong syringe, and scrubbing brushes.
- (8) A good supply of sample bags, which should be of stout canvas, and capable of holding four or five pounds; also stock of printed labelling tags. The

utmost care should be taken to have the bags thoroughly cleaned after each handling, by being turned inside out and beaten, and an occasional wash will do them no harm. Salting is as easy with mine samples as with any other kind, and if the dust from a leader carrying ounces remains in the bottom of the bag, it is certain to influence the assay of the next sample.

To determine the positions of the sections to be taken, distances of 10 feet or less, as the case may be, are measured off with the tape, starting from some conveniently placed survey peg. The sections are marked with the paint, and every tenth section may advantageously be numbered. This enables any errors in booking the sequence of the sections to be rectified. The next step should be to wash down the sections carefully. A boy in advance with brush and syringe can keep pace with the samplers, and it will be found that careful washing saves a great deal of time. The actual chipping of the samples is not so easy as it at first appears, and at times, in very hard ground, it is very trying and requires a great deal of patience. Attention should be paid to the following points: Equal quantities must be taken from all parts of the section sampled. A sample consisting of two pounds from the lower portion and one pound from the upper portion would be worthless; for the gold is by no means evenly distributed over the thickness of the reef. Not infrequently a flake can be removed covering the whole face of the reef, and this, broken up, will be a most satisfactory sample. My opinion is that the actual size of the sample is of no consequence, provided that sufficient material can be brought up for assay, and the correct value insured. Between two and five pounds is the usual weight; others, again, believe in having big samples, even as much as ten to fifteen pounds; but with big samples it is difficult to take correct proportions. The footwall side of a drive is sampled by choice; though this is not always feasible. In sampling winzes, rises or crosscuts, the side which is most convenient and the best exposed ground is chosen. I have even sampled both sides of winzes and rises.

In drives, the reef in the footwall side at times disappears in the roof. In such cases it is necessary to sample the hanging wall side, and to make allowance for the dip when afterwards the diagrams are plotted. Again, a longitudinal fault may have thrown the reef from the footwall. If it appears on the hanging wall side, it should be sampled there, and the fact noted.

Once the sample is taken, it is of great importance that the width over which it was taken should be accurately measured, and although it may seem superfluous, I recommend the use of a couple of light slide staffs. After the reefs have been traced, both on the foot and hanging wall sides, the staffs are placed in position, and the reef carefully measured at right angles. At the same time the dip can be recorded. Samplers are too apt to place their foot rules vertically across the reef, or at times simply to guess the width.

For underground purposes two books are required, one for recording the samples, and a book of rough co-ordinate paper with squares of ½ inch for sketching the reef. When the section has been recorded in both these books, a tag, properly numbered, is placed in each bag. I find that when dealing with hundreds of samples it is advisable to have the width of reef and the date on the ticket, as it helps to trace samples in case of error.

When reproducing the sectional drawings on the surface, carefully prepared co-ordinate paper should be used, divided into eighths or tenths, and 6 or 8 inches wide. I find that the best representation is obtained, not by making all the reefs straight and parallel, as is Burnham's plan, but by using the foot of the level as a fixed horizontal datum, and setting off the heights from this. This represents more truly the actual position and shape of the reef, which is by no means a flat and even bed. Where apparent undulations in the reef are caused by the crookedness of the drive, this fact is noted on the diagram.

It is desirable to represent the value over the intended stopping width by some graphic device. Burnham uses colors for this purpose. For instance, a yellow line underneath a section denotes a value of over 20 dwts., while a red line represents between 15 dwts. and 20 dwts., etc. I find, however, that the representation is more clearly effected by erecting perpendiculars to a datum line at each section, proportional to the stopping value. A line joining these ordinates will then show at a glance what the value is at any point. Where two reefs are carried together it is advisable to represent the values separately in different colors, as well as the value of the combined leaders.

The following hints may be useful to those about to start these sectional drawings. Fixed colors should be taken for each reef, as for instance:

The Main Reef is colored green.

The Main Reef Leader is colored red.

The South Reef is colored blue.

A useful scale will be found to be 2 inches equal 10 feet horizontally, and ¼ inch equals 1 foot vertically. Sections are marked by a red vertical line at the true position to scale of the actual section sampled. These are numbered, and the distance in feet from the original shown. Should there be intervals of more

than 10 feet without samples, the tens of feet are shown but no red line or number, for these are not true sections.

A study of the cross-sections of the mine will give an idea of the distances apart at which to expect to find the payable leaders in various parts of it, and also of their dip at various depths.

Of the landmarks which the sampler has to guide him in the Central Rand, by far the most important is the dike of igneous matter which has intruded itself between the hedding of the Main Reef Leader and the Main Reef, known as the interhedded dyke. The dyke is of variable thickness, being in some places 15 feet thick, while in others it can be traced as a thin shaly parting. It is, however, almost invariably present between the lower members of the Main Reef series, and I must say that in my experience, which is mainly of the portion of the Rand, say, between the Ferreira Deep and the Glen Deep, the interhedded dyke has not as yet failed me. I should, therefore, like to lay stress on this point, which will be a great help to samplers in the correlation of different members of the series.

Manufacture of Portland Cement in California.

Written for the MINING AND SCIENTIFIC PRESS by
O. S. BRESEE.

The works of the California Portland Cement Co. of Los Angeles, Cal., are located on the Southern Pacific and Santa Fe Railroad tracks, near Colton.

Besides the cement plant the company have a large lime burning establishment, a plaster of Paris plant, a marble dust plant, a rock crushing plant with a capacity of 750 tons daily, using a large Austin gyratory crusher, manufactured by the F. C. Austin Manufacturing Co. of Chicago, Ill., and several marble quarries, producing thirty-six different varieties of marble, which is sawed into slabs, polished and shipped all over the coast. The Rialto building

Chimney Constructed of Colton Cement, Los Angeles, Cal.

of San Francisco, Cal., is decorated with marble from the company's plant, and several other buildings of nearly as much importance could be mentioned. In fact, every possible product to be made from carbonate of lime is here manufactured, and about 140 men are employed. The capacity of the cement plant is 450 barrels of cement daily.

These works were erected in the spring of 1893

and commenced manufacturing cement under the technical direction of the present chemist, E. Dur-ye, who was one of the pioneers in this industry in the East. He was connected with the first works to manufacture Portland cement in rotary kilns by the direct process. With dry materials this was first done at Rondout, N. Y., and with wet materials at Montezuma, N. Y. Previous to its having been done by the direct method at those places the practice had been to either rekiln, make into bricks and wet, dry and regrind the materials previous to burning them in the rotary kiln. The Colton works were the second to feed the raw material directly after mixing, and grinding them together, into the kilns for burning in a continuous process.

The kilns at Colton are the longest in use in the world for this purpose, being 75 feet long, 5 feet in diameter for 55 feet of their upper length, and 6 feet in the lower 20 feet.

Calcite and clay are the raw materials used—about three parts of limestone to one part of clay make the usual proportions. Large ledges of limestone are found in Slover mountain, directly in the rear of the mill. After being quarried, it is taken in small cars through a 425-foot tunnel, crushed and dumped into a chute 2 feet high, 3 feet wide and 370 feet long, which delivers it on the highest terrace in the mill. The analysis of this rock is as follows:

Silica.....	.55
Alumina.....	.85
Carbonate of lime.....	98.60
Total.....	100.00

The purity of the rock contributing to the uniformity of the cement and its freedom from objectionable elements are the chief requirements. The clay is brought over the Southern California railroad (Santa Fe), 30 miles from Perris, Riverside county, where extensive beds of cement clay are owned by the company.

To manufacture Portland cement it is important that the raw materials should be cheap, uniform and free from large percentages of insoluble quartz sand, and also should not be hard, as in that case the cost of grinding the raw material to the requisite degree of fineness would be excessive. Hard materials require much finer grinding and more careful preparation than soft materials do in order to make good cement. Avoid excessively high percentages of free lime, which is very objectionable in Portland cement, an artificial product consisting essentially of tri-calcium silicate and di-calcium aluminate. Commercial cements always carry some calcium ferro-aluminate.

The limestone from the chute at the Colton works is stored in bins alongside of a small clay bin and the mixing and raw mill room where the rock and clay are weighed and mixed previous to grinding in Griffin mills. Sampling of the raw mix, and standardizing it for lime, is an operation necessary once every hour. The grinding of the raw mix is a tedious operation, being made as fine as the finished cement before it is fed into the kilns. Large bins, the bottom of which are on a level with the upper end of the kiln, contain the pulverized material from whence it is drawn by screw conveyors, operated automatically by the kilns at a regulated speed, into the kilns in a continuous stream. Being on an incline, the rotation of the kilns causes the material to travel slowly down the length of the kiln, which is turned completely over once every minute. The mixture is two hours in going the length of the kiln.

Petroleum is used as fuel, and is sprayed into a combustion chamber opposite the lower end of the kiln. Atomization of the oil is accomplished with an air blast from a rotary blower. About 2500° F. is maintained at the lower end and about 1200° F. at the upper end of the kiln.

Moisture leaves the raw mix first in its descent, then the carbonic acid is expelled from the limestone; when about 20 feet from the lower end, at a temperature of about 2150° F., there

is a reaction between the caustic lime, the silica, alumina and ferric oxide, by which the silicate and aluminate salts of lime are formed. A viscous condition of the materials is then produced, which agglutinates into nodules and take on a glistening appearance. High heat and fine grinding contribute to the chemical reaction necessary to the formation of cement. If the heat were not high enough a mixture of lime and burned clay would result, and if the heat were too high a vitreous slag of no strength would be formed.

If the raw mixture contains an incorrect proportion of lime, the clinker will dust or slake on cooling and exposure to the air. The burned semi-vitrified material is called clinker and falls in a continuous stream from the kilns. After cooling, this clinker is in the form of black nodules. They are hard and heavy,

Austin Gyratory Crusher, Used at Colton Cement Works.

and the sunlight striking them produces a sparkling appearance, due to the crystallization. When cold, the clinker is ground into an impalpable powder called Portland cement. About 380 pounds of cement will make a barrel of finished product and consumes 570 pounds of raw material. The Colton Portland cement has the following analysis:

Lime.....	61.512
Silica.....	22.500
Alumina and ferric oxide.....	12.400
Magnesia.....	.750
Sulphuric anhydride.....	1.200
Alkalies.....	1.500
Total.....	99.862

Modern Mining Methods.

A special report to the British Government made by the acting British Consul at Chicago, T. Erskine, a copy of which has been received by the Treasury Bureau of Statistics, entitled "Report on the Iron Ore Industry of the United States," gives especial attention to the modern methods of mining and handling ore. In mining ore in certain parts of the Lake Superior region the top covering of ground or rock is stripped off over the whole property before mining begins. Railroad tracks are then laid direct to the ore bed and the ore is loosened by blasting. Steam shovels are then brought into use and they load the ore directly upon the cars, one of these machines having loaded 170,000 tons in twenty-six days, or at the rate of over 6500 per day. These loading machines, which daily handle more than 6000 tons, are each operated by five men, and the labor cost for mining and loading averages but about 16 cents per ton, and in the case of one mine which dug and loaded 203,651 tons in 174 days, the labor cost was only 4 cents per ton.

In the transfer of ore from mine to vessel on the Lakes the absence of hand labor is also noticeable. The ore trains are run on to long docks extending high above the water and having large pockets or apartments into which the ore is discharged from the cars through an opening in the bottom of the car, from which the ore runs by gravity into the pockets beneath the tracks. From these pockets the ore is loaded into the vessel, also by gravity, and passed down long chutes into the hold of the vessel so that no hand labor is required in transferring the ore from the cars to the vessel. The ore pockets or apartments, which form a part of the dock, hold about 160 tons each, and number from 90 to 384, according to the length of the dock.

In unloading the ore from the vessels the saving of labor through the use of machinery is even more notable and important in its economies and results. A series of steel bridges, so adjusted as to be easily moved along the docks, is supplied with a hinged arm, which can be lowered to the hatch of the vessel. Along this arm and across the bridge runs a trolley train to which are attached automatic "grabs" similar to a double scoop, which are so constructed that the grab or scoop digs downward into the ore as it closes. The grab or scoop holds about five tons of ore and is described as a "digging machine," as when it begins to draw together it digs into the ore and does not depend on its weight to get hold of the ore. There are fifteen unloading machines in a battery, and the grabs run down the long arms which are lowered over each of the fourteen hatches that are in the deck of most Lake vessels carrying ore. These hatches run nearly the whole way across the decks. The grabs can thus remove over half the cargo without any assistance and the remaining half is brought directly under the hatch by use of a scraper also operated by similar machinery and managed by a man in the hold through the use of long cords. This scraper brings the ore from between the hatches so that it can be raised by the grab. These grabs are controlled by the engineer, who can drop them at any point over the hold that he

may wish, and after it seizes its load of ore it is raised at full speed, carried rapidly along the trolley to such given point as desirable, where the ore is deposited on to railroad trucks or stock piles, or in some cases into concrete troughs, through which it slides to the furnaces, where it is to be transferred into pig iron. This grab, which thus lifts five tons of ore from the vessel carrying it to such point as is desired within a limited space, has a hoisting speed of 100 feet a minute, and can run along the bridge at the rate of 1000 feet a minute. The operator travels with the grab and can unload it at any given point desired. The bridges to which these arms with their grabs are attached can be swung in any direction, so that ore, limestone or coke can be deposited or picked up anywhere in the yard, and are worked by electricity. Twenty-six men will now perform, under this system, the work for which 300 were required under the old system.

Tin Concentration in Cornwall.

Written for the MINING AND SCIENTIFIC PRESS by
C. M. MYRICK.

Any one who has had to do with mining work knows how much labor and time is expended in reinventing milling machinery along lines that have been already threshed out. The examination of old-style plants is always interesting in itself and would often prove profitable to inventors in showing what to avoid.

Tin concentration in Cornwall was developed along lines of its own that fitted the climate and the labor conditions of the country. The tin ore from the mines is crushed under gravity stamps and then the "black tin," amounting generally to about 2%, is separated by wet concentration. This "black tin" is the local name for cassiterite, an oxide which contains 78% metallic tin when pure, but as sold at the mine it runs about 70% tin.

The pulp from the battery is usually classified in some form of pointed box to get rid of the slimes and excess of water, which are led to settling tanks, while the coarse is discharged into a stationary huddle.

Usually the huddles are 18 or 20 feet in diameter and 18 inches deep, with the bottom gently sloping

for burning, while probably more than half the whole must be retreated.

The two or more grades of middlings are wheeled to the second line of buddles and dumped on the floor. Girls then slowly shovel them into a V-trough, in which jets of water are falling, to wash them into the buddle, where they are treated just like the original pulp from the battery. As before, this second oper-

Buddle Floor, Cornish Tin Mine.

ation gets rid of about one-quarter of the waste and leaves a large amount of middlings for re-treatment. These are wheeled somewhere else to be handled and rehandled, until they finally disappear, but the layman never knows just how.

In watching the operation the idea always suggests itself that there may be some particles of the ore not good enough to be saved and too good to go into the waste that have been making the rounds of the floors for an indefinite time. At some places the coarsest sands are separated, to be further pulverized either in ball mills or in grinders that resemble our grinding amalgamating pans, but not so deep, and provided with a continuous feed and discharge.

The saving of the very fine material in the slimes presents the same difficulty as in the working of sulphide ores. Many ways have been tried, but all are slow and expensive and of no very great efficiency. In the better equipped works the slimes from the battery pulp are fed on revolving huddles that work on the same general lines as the Evans table of this country. They are about 20 feet in diameter, with either a convex or concave surface, according as the slimes are fed at the center or the circumference. As the table revolves, each part of its surface is brought under jets of clear water, sometimes aided by a revolving brush that clears it of the accumulated concentrates. Usually the tailings from this treatment are settled and then retreated on "dead" frames.

These frames are very generally used and are not unlike the canvas plants now popular in California. Each frame has a sloping platform of dressed boards, about 5 feet square, over which a thin layer of slimes is allowed to flow. At one time girls swept them down with brooms at regular intervals, but latterly they were made automatic by a very simple but effective contrivance. They are generally laid down in groups of 50 or 100, and along the upper ends two launders run, one for the slimes and the other for clear water. Suitable openings in the slime launder allow for the proper feed, while from the water launder a small stream drops into a V-trough, extending across the head of each frame, and pivoted at the ends in such a way that when empty it stands upright; but when the water reaches a certain height it tips forward and discharges the water over the frame with a rush that clears it of accumulated concentrates. It then automatically returns to its upright position. This tipping trough is connected with a swinging apron extending across the lower lip of the frame, in such a way that when it tips the flow of material is momentarily diverted into a different launder from that of the tailings, so that the enriched product is led to its own settling tank.

The concentrates from this operation are not high grade and are always reconcentrated. Sometimes the frames are in tandem, the second one retreating the tailings from the first.

The capacity of these machines is very small, for at one mine, working over 250 tons of ore per day, over 500 were in use, in addition to forty revolving buddles, all working slimes.

As may be surmised, a complete plant of buddles, frames and settling tanks to handle 200 or 300 tons per day covers many acres, and is often strung out far down the drainage slope. In the older mines, especially, the works are the result of a gradual growth from small beginnings. As new methods were devised for saving a little more from the tailings, new "floors" were added below, and even when they flowed away from the company's lands leasers picked them up and saved a little more. Finally they reached the ocean, and it was found that the wash of the

waves had a concentrating effect. After a storm the heavy material is found laminated on the beach, just as black sand is found everywhere. This is scraped up, reground and concentrated and a little more tin won from it.

Not much power is required on a huddle floor besides muscular arms; but some is needed everywhere to revolve the distributors and sweeps and turn the slime huddles. To obtain this power much ingenuity is sometimes shown in utilizing the fall of pulp and wash water to operate little water wheels. One never realizes the possibilities of power transmission by line shafting until he sees the contortions of those long strings of slow-turning rods, as they extend in erratic lines from the water wheels across the buddle floors.

After the ore is concentrated until it contains 25% black tin, it is sent to the calciner, where the wet concentrates are fed on the center of a circular rotating hearth, the speed of which can be adjusted to suit the amount of burning required. Stationary plows gradually push it towards the circumference, where it is discharged into chutes that lead to the cooling floor. This burning has no effect on the refractory tin oxide, but burns any sulphides or arsenides of iron into oxides, and seems to make all the gangue material more flocculent, and so aids the final separation.

This is mostly accomplished by huddling on lines similar to the previous work, but more carefully, on account of the high value of the material. Some grades seem to separate more easily when "kieveed"—that is, one man with a wooden paddle keeps the water of a deep tub in rapid rotation, while a second shovels in pulp until the contents thicken. Then it is allowed to come to rest and is settled by striking the tub with a mallet. When the water is drained off, the lighter material is found at the top and the clean concentrates at the bottom.

The practically clean black tin from these operations is wheeled to the "tin house" and is ready for sale to the smelters. Every two weeks agents from the smelting companies visit the mines and take samples for assaying, and at a later day representatives of the mines and smelters attend a meeting known as "Tin ticketing," where bids are offered and each lot sold to the highest bidder.

At the smelting works the concentrates are mixed with fine coal and a little lime and charged into a reverberatory furnace. This is fired until the carbon reduces all the oxide to metallic tin, which is then ladled out and cast into bars for shipment.

The concentrating process, as outlined above, was universally used up to a few years ago, at which time experiments were made with the idea of introducing machinery to take the place of so much hand labor. It was then found that the pulp could be taken directly from the stamps to Frue vanners, over 90% of the tin taken out in one operation and concentrated into a product suitable for the calciners.

Moreover, the vanner concentrates contained twice the percentage of tin as the huddle product, so that the expense of calcination and subsequent treatment was cut in half.

The more progressive mines have adopted the new system and Cornwall now has some crushing and concentrating plants that are thoroughly up to date. What is locally known as the Cost Book system has had much to do in perpetuating the old methods of working. A number of men secure a working concession from the owner of the land and subscribe enough money to open the mine and erect reduction works. At regular intervals of a month or more all the stockholders meet at the company's "count house," when the mine manager reports on the condition of the mine, the tonnage worked and the expenses and proceeds. If there is a profit, it is divided up; and if the cost book shows a loss, the deficiency is made good by an assessment. No considerable capital is kept in the treasury nor attempt made to husband rich ore to carry the company over periods of scarcity; in other words, it is a question of taking the greatest possible profit to-day and letting the future take care of itself. Naturally, the tendency of this system is to discourage any large outlay of capital for expensive milling plants. After the meeting has approved the accounts, all present sit down to a substantial and sometimes protracted dinner, where the discussion of the mine's affairs is informally continued and toasts drunk to the success of the "hal" (mine).

The modern millman is the one who is awake to progress and the improvement of methods. It may be that his tailings are as low as it is business to make them; but methods may be changed sometimes to effect greater economy in working. A proper conception of the size and disposition of the working force is as important as low tailings and should receive the attention it deserves. The original design of the mill is important in this regard, as by ill-advised planning a larger force is sometimes required.

Head Frame New Dolcoath Shaft, Cornwall, England.

from the center to the circumference. In the center is a mound 5 or 6 feet across, with a slightly conical top. Pivoted in the center of this a vertical shaft revolves, carrying a pulp distributor, and four wooden arms that extend out over the buddle. These arms carry strips of cocoa matting frayed at the ends, or, sometimes, whisks of brush, that drag lightly over the sand as it accumulates in the buddle. When they are not used, it is found that a large piece of gangue and a small particle of heavy mineral will come to rest at the same point; but the gentle brushing of the sweeps helps to work the waste toward the tail. At some point of the circumference there is a sliding door, perforated with auger holes, for the escape of the water and slimes. As the buddle is filled, the foreman examines the contents and with the point of his shovel draws four or five concentric circles on the surface of the charge, their relative position depending on the richness of the mineral within each. The huddle crew then shovel the outer ring, which is mostly slime, into a launder that leads to a settling pond; the next ring is thrown into the waste launder; the intermediate rings are each shoveled into wheelbarrows and carried to other buddles for re-treatment; while the inner ring of all, containing about 25% black tin, is sent to the calciners. The total result of this first huddling is that about one-quarter of the waste has been removed from a parcel of pulp; another small part has been enriched enough

Winding From Great Depths.*

In a consideration of the Whiting system, the point that presents the most trouble to the writer is the sinking of shafts with safety and speed. The following, however, appears to be a complete solution for our particular requirements for a vertical depth of 5500 feet:

1. Adopt the system suggested by Messrs. Sederholm and Seymour, now being put into effect by the Rand Mines, Ltd., of providing temporary cylindrical drums to go down to a depth of, say, 2000 or 3000 feet. Sinking to this depth by this means is one of acknowledged safety, vide Catlin shaft—3700 feet. It has been shown that, when the reef is intersected, two sets of Whiting engines would be required—one for men and the other for ore—using the same diameter of rope. Between 2000 and 3000 feet take the cylindrical drums off the engine, use the sheave system with tailrope and establish a station at a depth of, say, 2500 feet. At this point start the second Whiting hoist on the surface, and use it simply to hoist a kibble to this established station. By this means we practically adopt a stage-winding system recommended by Mr. Behr, with the difference, however, that we use Whiting hoists instead of conical drum engines, and, when the shaft is sunk, each engine commands the total depth of the shaft without a stage.

By this system of hoisting, the reef can be reached more quickly than by any other way, and will justify the difference of cost of double attendants for shaft sinking after, say, 3000 feet. The danger of serious negative moments will be overcome by the constant length of rope always in the shaft of, say, 2500 feet, and the latter part of the sinking can, if desired, be done by making the rope taper in parallel rope sections, as recommended by Mr. Behr, from the 2500 feet to the bottom of the shaft.

Another extra safeguard that can be adopted in connection with the Whiting system, or in fact any other, is to make the rope and connections with the skip, cage or bucket with much larger factors of safety for the distance near the connection of the load and up to the hoisting drums.

2. Regarding minimum running cost, it is obvious that, for a depth of 5500 feet, it will be cheaper to keep one set of winding engines running rather than two to do the same work in two stages, and to have engines with smaller cylinders than those used with conical drums, and whose work is more uniform, and whose piston speed can with safety be greater. Tandem compound engines, suggested by Mr. Behr, are in use in the Whiting system and to better advantage than large diameter conical drums, which only use high pressure cylinders, evidently to secure safety and smoothness of running.

3. Minimum initial expenditure: Certainly the Whiting system has advantages in both size of drum, size of cylinders and weight of running parts. The price of the hoist constructed for the Rand mines is estimated erected at £13,500. The writer will leave Mr. Behr to figure out the cost on these fields of an engine similar to that designed by E. P. Allis or Nordberg at Lake Superior, and would like to see estimates for those he would recommend.

It will be noticed that, with the conical drum two-stage system recommended by Mr. Behr, some six more large conical hoisting engines would be required than with the Whiting hoists, and these hoists will certainly cost more than the Whiting engines; so it is safe to say that this method of hoisting would entail a first cost of £75,000 to £100,000 for each typical Deep Level Company, in excess of the installation of the Whiting system working only in one stage. Mr. Behr shows that, after making use of the two stages in the vertical shaft, he would still use independent hoisting arrangements underground in following the reef.

4. Flexibility: For moderate depths double drum cylindrical and double drum conical engines with hydraulic clutches, etc., might show to advantage when compared with the Whiting system; but for great depths it is seen that all the main winding engines of the world on these systems are made practically inflexible, the moving masses evidently being considered too great to be dealt with by clutches, and the Whiting system is the only one which it seems possible to render flexible for its maximum depth capacity. But it is a very vital point in this discussion, for vertical shafts, as it is seen, there is no necessity for flexibility after sinking is done, beyond taking up the stretch of the rope.

Mr. Behr can, and may, claim that he is able to construct a different type of conical drum engine than that which has ever before been in practice. This may be so, but it would be a serious and costly experiment, and he is handicapped at the start by the fact that with the taper rope system the largest diameter rope must be wound on the smallest diameter of drum. Others have striven, by the use of wrought iron, etc., to minimize the weights of the drums, and thus the moments of inertia. Even if he reaches his expectations in this respect, the Whiting system has all the important advantages of small weights of drums, moments of inertia, more uniform velocity, smaller drums and cylinders, with the pos-

sibility of using to advantage greater piston speed, and wasting less power by overcoming the momentum with the use of brakes.

It may be urged that the Whiting hoist is not as advantageous in sinking as the conical drum hoist; that in sinking it is less flexible, as the Whiting would always require the use of two skips, and, if one got out of order, work could not be continued in one compartment. This is true, if the conical system is simply for moderate depths, but for greater depths the designs of the hoist show that not only one skip could be used, and that it would always have to be run unbalanced; for, without clutching arrangements how is it possible to run unbalanced skips to advantage? There would be no provision in the one fixed drum for varying the lengths of the rope as depth was attained, and, consequently, it would take twice the running time of the engine to clear out the rock at the bottom of the shaft, than would be the case in the balanced load with two skips and the Whiting engine. This would also apply when dealing with large quantities of water. Again, the Whiting system, by its take-up arrangement composed of a sheave on a movable carriage, running on a track, and adjusted by means of a small steam winch, can use balanced skips or kibles with ease and advantage for sinking to a depth of 5500 feet, and an accident necessitates no greater stoppage than with the large conical drum system.

An Aerial Tramway Installation in Eastern Oregon.

The Hallidie-Painter Tramway Co. of San Francisco, Cal., have completed the installation of a 2500-foot aerial tramway for the Eastern Oregon M. Co. at Bourne, Baker county, Or. There are three loading stations with automatic loaders, their particular feature being that two of them load at an angle of 20° from the horizontal (one is 800 feet from the upper terminal, the other 1600 feet.) The upper of these angle stations is shown in the accompanying cut. There are seventy-two buckets, 200 pounds

Loading Station on Aerial Tramway, Eastern Oregon.

capacity each, delivering 16 tons per hour at the lower terminal. The upper terminal is the adjustable, moving terminal, because of lack of room at the lower. At the lower terminal power is generated to run a blower for the blacksmith shop.

THE steam shovel in its varied styles and types is becoming constantly a more important factor in the handling of ores and rocks in surface mining operations at mines, in railroad work and elsewhere where large amounts of material are to be speedily and cheaply handled. These devices, originally constructed with a view to economically moving sand and gravel, are now built to handle not only fine, but coarse and heavy rock masses. Some of these shovels have buckets or dippers of four cubic yards capacity, and weigh seventy-five tons.

Ore Occurrence at Leadville, Colo.

Written for the MINING AND SCIENTIFIC PRESS by
F. ROBBINS, E. M.

To understand the occurrence of ore bodies in Leadville, something should be known of the general geology of the region. Briefly stated, the geological conditions are as follows:

(1) Beginning at the bottom with the Archæan granite—the foundation as it were—in which no ore is known to occur.

(2) Following this in ascending series comes the Cambrian quartzite, in which stringers and seams of ore are found—not extensive and not profitable, so far as known.

(3) Next are the Silurian limestones. In contact between the bottom of these and the top of the Cambrian quartzite ore bodies of good size occur. In these limestones themselves, where planes of stratification are split by intrusions of porphyry, underlying the porphyry, ore bodies are found.

(4) Next is found a persistent sheet of what is locally known as the "parting quartzite." Between this and the Silurian limestone ore bodies also exist.

(5) Above the parting quartzite comes the Carboniferous (or "Blue") limestone. This is the principal ore bearing measure of the district. In it, as above, where intrusions of porphyry have found weak places and split it, occur bodies of ore.

(6) Above the "Blue" limestone comes the so-called overflow or "Block" porphyry; also a persistent sheet all over the district, but distinctly different from the intrusive porphyry which is occasional, but plays a most important part where it occurs. In contact between this overflow porphyry and the Blue limestone the principal bodies of ore of the district, perhaps, are found; at any rate, the first ore discovered were in this contact. The sheet of overflow porphyry itself contains no ore.

(7) Overlying the last described measure in many places a glacial wash is found. This contains no ore.

The usual plan of exploration consists in sinking through the wash and overflow porphyry to the first contact, i. e., that lying upon the Blue limestone. Then through the lime in search of bodies in the planes split by the intrusive porphyries, and thence down into the succession of measures and occurrences already enumerated.

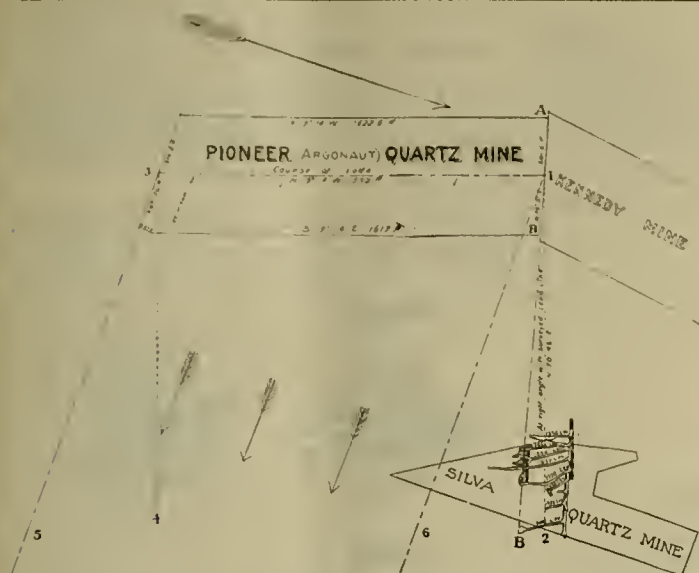

EARLY DISCOVERIES.—When the camp was first discovered there were exposed outcroppings of the overflow porphyry and the Blue limestone, with the ore lying between. This was supposed at that time to be the only ore measure. As development progressed shafts were sunk farther along the dip where there were no surface exposures of limestone, and finally some one blundered upon the lower contacts. This is the history of Leadville geology, briefly told.

The ore does not, however, occur as a measure, like a bed of coal, else it were very easy to sink and find it, but in certain channels, for illustration, like stream beds. Once in one of these channels it is easily followed, and had it not been for certain dynamic disturbances, which took place after the channels were made, it would be another simple matter to define the position of the ore. These disturbances came in the form of faults, raising or dropping great blocks of the formations, and sometimes moving them laterally as well. Hence a channel may be followed for a long distance, and then it shuts directly against a fault fissure and is for the time being lost, very much as if a horizontal seam of mortar

were followed in a stone wall until it came against a stone of the next broken course. Unfortunately the ore is not proportionately as plentiful as the mortar, but by digging about it is usually found again. This rough interpretation will hardly bear rigid scientific scrutiny, but will serve to explain the conditions to which I desire to call attention.

THE mapping of the world will be mostly an achievement of the twentieth century. The great map of the United States, begun twenty years ago, will require about a hundred years for its completion, and the chief of the Hydrographic Office reports that the 1250 chart plates in his possession represent only about one-third of what are necessary before the seas of the world will be sufficiently charted for safe navigation.

*By Hennen Jennings, from London Mining Journal (condensed).

The Argonaut-Kennedy Case. (See page 162)

An Efficient Air Blast.

Written for the MINING AND SCIENTIFIC PRESS by G. A. BIGELOW.

Having had occasion to open an old tunnel with a view of extending it, there arose a question of ventilation. Water was very scarce and no power of any kind available. The tunnel supplied from 1½ to 2 miners' inches, but this is a very small quantity apparently to ventilate 1000 feet of tunnel. The hillside dropped away on a slope of 40°, which gave ample fall for pressure, which, joined with the tunnel water, formed a problem to be solved if air was to be secured from their use. By extending the air pipe 125 feet it gave about 50 feet pressure, and having some 11 inches hydraulic pipe on hand this was used to reduce friction as much as possible in the air conduit. The pipe being kept as high as the tunnel would permit allowed clearance for moving timbers, etc., for tunnel work, and was then turned down by an elbow on the slope of the hill.

A few trees gave excellent opportunities for

Fig. 1—Spraying Device.

Fig. 2—Air Blast by Injector.

anchoring the pipe lines. Figures No. 1 and No. 2 give an idea of the arrangement used. Fig. 1 represents the spraying device which any blacksmith can make. A nozzle to screw into the

gas pipe fitting can be secured from any water wheel company, who always keep blank castings on hand and can be turned to suit very easily.

A larger nozzle, with one or two concentric hushings, is very convenient when the water supply is variable. The ring shrunk on the nozzle serves as a guide for the spray cone. The spray cone, made by turning a piece of copper or iron on an ordinary plumb hoh, and cast full of solder, makes a strong device, since the solder can be made to adhere to the wire guides.

The elbow screw in Fig. 2, in which the nozzle is screwed, can be turned on the pipe, making the arrangement either an exhaust or a blower at will.

Under 50-foot head, with ½-inch nozzle, using about 4 miners' inches water, a velocity of 280 feet per minute is maintained through 265 feet of 11-inch air pipe and 225 feet of 6-inch air pipe. This delivers about 55 cubic feet of air per minute.

The blast being situated on a slope, no arrangements for water escape were necessary, but in case the blast is arranged horizontal a sag of 8 inches to 10 inches can be made in the air pipe and an adjustable vent made for the water, so maintained that a little water always stands over the vent, thus preventing the air from escaping.

The diameter of the air intake pipe should be three or four times the diameter of the final delivery pipe, and is best in the form of a taper, which acts as a throat.

North Columbia, Cal., March 3.

Efficiency of Compressed Air.

In discussing compressed air, J. J. Flather in Casier's Magazine for March says:

To obtain the most satisfactory results the air must be used expansively, but usually where the demand for power is intermittent no attempt has been made to reheat the air, and as a result the combined efficiency of compressor and motor is low, varying in general from 20% to 50%. While low working pressures are more efficient than high, the use of such pressures would demand larger and heavier motors and other apparatus, which is undesirable. The advantages of higher pressures in reducing cost of transmission are also well recognized, and the present tendency is to use air at 100 to 150 pounds, instead of the 60 or 70 pounds of a few years ago.

By reheating the air to a temperature of about 300° F., which may often be accomplished at small expense, the efficiency is greatly increased—in some cases the increase has been found to be as high as 80%. While the lower pressures are yet more efficient, the loss due to higher compression is not serious.

If air be used without expansion there is a material loss in efficiency, but, on the other hand, if it be used expansively without reheating, trouble may be experienced from drop in temperature below the freezing point. With moisture present, this drop will cause the formation of ice, which may clog the passages if proper precautions are not taken to prevent it. The low temperature will not in itself cause trouble. If, therefore, the moisture which the compressed air holds in suspension be allowed to settle in a receiving tank, placed near the motor or other apparatus, and frequently drained, trouble from this cause will be largely avoided.

While it may be impracticable to reheat the air in certain cases, yet there are many situations where a study of means to overcome the losses referred to would result in marked economies.

Pyritic Smelting.*

By FRANKLIN R. CARPENTER, Ph. D.

Stripped of all fanciful claims and descriptions, this process is simply a revival of the ancient German process of raw smelting. By its means sulphide ores are treated without previous roasting as in ordinary lead and copper smelting, and the carrier of the precious metals becomes matte—usually an iron matte very low in copper instead of lead or high-grade copper matte of the ordinary process. Some copper is desirable, and when gold is present may even become necessary, but unless copper is carried by the ores treated, or handled at a profit, its use to a great extent is to be avoided, as it complicates the subsequent refining operations. From long experience, even with high grade gold ores, I concluded that copper is of less value in making clean slags than a proper observance of certain slag compositions, that are fluid and of low specific gravity, and a proper means of separating or settling the matte out of the slag.

The process is in no sense new or untried, nor in America have we really added anything new to it, not even the hot blast. Our improvements have been in the way of ease of manipulation, increased output and decreased cost.

It is unfortunate that we have confused two or three processes in the term pyritic smelting. Originally it meant only the use of iron pyrite for a carrier, instead of lead or copper matte. This is the sense in which Percy first used the term in describing the process employed at Kongsberg, Norway—Sala, Sweden—Siberia and elsewhere. No reference was had to the use of pyrite as either a fuel or a flux. Metallurgists had from time immemorial burned or roasted sulphide ores in the open air, thus losing their fuel value, before putting them into the furnace. The sole object of this was to get the iron into such condition that it could unite with and fuse and not run away from the silica, the mention of which constitutes to-day the only difficult point in pyritic smelting. After the invention of Henry Bessemer in steel converting, Halloway in England sought to apply the same principles to the Rio Tinto copper ores. He reasoned rightly enough that if the fuel value lost in burning the pyrite could be utilized in smelting it, a furnace could be driven without carbon fuel. This was clearly a different process from that described by Percy. Dr. F. L. Bartlett went to England and studied the methods of Halloway, and with more or less success applied them in Portland, Maine, where he for several years operated smelting works. Afterward came W. L. Austin with his plant at Toston, who, at first, sought only to revive the ancient process of pyritic smelting, but his later work was along lines that have been laid down by Halloway. Austin's article published in the Proceedings of the American Institute of Mining Engineers attracted instant notice. After this came Lang, following the work of Bartlett, and myself following Austin mainly, but with a knowledge of Bartlett's work and of European methods as well. A host of others came later. Many of them were metallurgists of muscular type, who brought ridicule upon the process, but others, like Robert Sticht, were of a different type, and did much to advance the subject. It is hard to define a process which runs from pure matte smelting upon one hand, where everything is prepared outside the furnace, to straight Bessemerizing upon the other, where all reaction takes place inside the furnace. The term, pyritic smelting, has come to cover every sort of precious metal smelting that is not either a distinctly copper process or a lead process. A wide variety of ores may be treated by it. They may be absolutely free from pyrite, as the siliceous gold ores of the Black Hills, where limestone is added for flux and pyrite simply for the carrier, or they may be siliceous pyritic ores like those of Gilpin county, Colorado, or Butte, Montana, or they may be exclusively pyrite, like those of Keswick, California, calling for silica. The pyrite may perform one or two or three offices. It may be added exclusively to form a carrier; it may be both a carrier and a flux; and lastly, it may become all three, carrier, flux and fuel. In the first case there is no difficulty in running the furnace. The blast is cold—carboniferous fuel and limestone or oxidized flux is added—and the muscular metallurgist shines in all his glory—for a little more flux or a little more fuel are matters of supreme indifference to him so long as the furnace does not freeze up, and usually it doesn't—while the flux and fuel last. In the second case a little more skill is required, as an excess of fuel is liable to cause a decrease of flux by reason of the pyrite melting and running away from the charge, instead of oxidizing and uniting with the silica. In this sort of intermediate pyritic smelting the blast is usually cold, and the pyrite, if a proper proportion of fuel and other flux is observed, will, in the presence of silica, break up partly and furnish the required iron oxide, as well as carrier, but there is trouble always lurking around. Sometimes all the pyrite oxidizes and no matte is formed. Sometimes it all melts, running below the tuyeres, resulting in a

* From Bulletin Colorado School of Mines, condensed.

frozen furnace in spite of every care, including the foreman's cure-all of "more coke." In the third example it is absolutely necessary to have a hot blast. The best examples are the methods of Robert Sticht, South Australia, and Wright of Keswick, California. At the last place it is claimed that as high a grade of matte is now made with the use of the hot blast and low coke as was formerly made when the ore was roasted and the ordinary methods of matte smelting employed.

The cost of smelting in these three examples, labor and supplies being the same, decreases as the amount of pyrite increases. It will be readily seen that extraneous fuel and flux cost money, and so far as they can be reduced, just so far will the cost of smelting decrease. The Deadwood plant is an example of the first kind. The ores which bear the cost of smelting are all siliceous, averaging 76% silica, 12% to 20% FeO, with small quantities of lime, magnesia and alumina. The pyritic material used was formerly, and is again lately absolutely barren of gold, silver and copper. For awhile the Homestake concentrates were employed, which gave rise to an excessive amount of flue dust, which was resmelted in reverberatories, and the resulting matte added to the ore charge, so that they were finally forced through the furnace; but their use is now abandoned. The coke was always poor. The charge consisted of equal quantities of siliceous ore and dolomitic limestone, with sufficient barren pyrite ores and copper ores to form matte. The cost of smelting per ton of siliceous ore was never below \$6.50. This included coke, limestone, coal for reverberatories and boilers, labor, barren pyrite, matte treatment, copper ores handled at a loss, supplies, assay office expenses, general office expenses, salaries, etc.

(TO BE CONTINUED.)

Mining and Metallurgical Patents.

PATENTS ISSUED MARCH 3, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

METHOD OF FREEZING THE GROUND AND EXCAVATING OR TUNNELING.—No. 721,830; C. P. Perin, New York, N. Y.

Method of excavating which consists in, first, constructing pilot tunnel in advance of main excavation; second, extending radially therefrom plurality of cells; third, circulating therein freezing agents; fourth, inserting therein means for disintegrating surrounding material; fifth, disintegrating surrounding material; sixth, removing disintegrated material.

COAL OR ROCK DRILL.—No. 721,895; L. K. Koontz, Allegheny, Pa.

Combination of bearing head having circular opening, sleeve of greater length than head and mounted between its ends to rotate in head, annular enlargement.

ment at one end of sleeve adapted to bear against one face of head, friction device secured to opposite face of head, projecting portion of sleeve being formed with annular depression which receives friction device, thereby confining sleeve against longitudinal movement, means for adjusting device, and drill extending through sleeve and operatively engaging same.

BLAST FURNACE.—No. 721,956; C. W. A. Koelbeck, Cleveland, Ohio.

The combination with blast furnace, of inclined bridge leading to its top and loose connection between bridge and top arranged to allow movement of one relatively to that of other and having pivotal link connection with furnace top, and skip movable along track supported upon bridge.

TUYERE FOR CUPOLA FURNACES.—No. 722,062; S. Watt, Barnesville, Ohio.

A tuyere for cupola furnace, comprising open front casting, removable front plate, interlocking lugs on casting and front plate for securing latter to former, with jet apertures permitting the front plate to be removed when forced upwardly.

HYDROCARBON BURNER.—No. 722,155; H. L. Sherwood, Oakland, Cal.

In oil burner combination of suitable base, upper and lower detachable sections resting on base, each having upwardly pointed conical portion, portions fitting one within the other and provided with means for forming spiral conduit between two portions, nozzle extending from one of sections and connected with lower portion of conduit, oil supply pipe connected with upper portion of conduit, means for making gas-tight joint between two sections, spreader supported upon burner and having wing arranged to be impinged upon by flames from nozzle.

CONVEYOR BELT.—No. 722,041; G. C. Plummer, Philadelphia, Pa.

Conveyor belt, having central firm and unyielding body and flexible webs along side edges thereof, belt being made up of series of plies of canvas connected by longitudinal rows of stitches, stitches in body extending through all of plies thereof, and portion of stitches in webs extending through two or more of outer plies only, body being saturated with drying, hardening composition, and webs being saturated with non-drying composition.

METHOD OF CONVERTING MATTES.—No. 722,198; R. Baggaley, Pittsburg, Pa.

Method of converting copper which consists in supplying air blast beneath surface of bath, and applying extraneous heat of flame to surface near end of converting operation, and maintaining thereby temperature of bath sufficiently high to prevent formation of copper noses.

SELF-OILING WHEEL.—No. 722,044; E. Ramsay, Birmingham, Ala.

In self-oiling wheel, combination with fixed axle, of wheel having hub formed of inner and outer webs providing annular space between them, longitudinal ribs dividing space into oil chambers and terminating near one extremity of space, lateral ribs extending from each side of ribs and constituting with longitudinal ribs oil receptacles communicating with space between adjacent ends of lateral ribs, linchpin passing through axle in space for holding wheel thereto, inner web of hub extending beyond linchpin and having closed end integral therewith against which end of axle is adapted to abut, there being oil holes in inner web adjacent to longitudinal ribs for feeding oil to axle, and oil supply communicating with linchpin space.

SMOKE CONSUMING APPARATUS FOR FURNACES.—No. 721,652; J. Alves, London, England.

In smoke consuming apparatus for steam boiler and other furnaces wherein heated air, under influence of steam jets, is supplied to furnace, bridge A, walls therein dividing bridge and constituting passages a' for incoming air and alternating passages a for heated air, steam superheater B secured to upper side of bridge, steam jet pipe D traversing passages a', a, and in communication with superheater B, and chamber E', at rear of bridge, into which passages a' open, latter serving to conduct and heat air prior to being impelled through alternating passages a under influence of steam jets into furnace.

Methods of Mining Coal.

Coal mining differs somewhat from metal mining in numerous important particulars. The methods generally employed are briefly described by J. F. Kemp, in Bulletin No. 1 of the Engineering Company of America, as follows:

"The simplest methods are by open cuts. Along the outcrop of the thick seams, especially where the dip is flat, the over-burden may be removed within allowable limits of cost and the coal may then be quarried out. The day is rapidly passing for this method. In underground work it is important to ground the shaft at the lowest point of the coal within the tract tributary to it. The coal will then roll down to the hoist. As nearly as possible the ground is blocked out with gangways which run in parallel pairs, so that fresh air may travel out one and return on the other. Chambers are then turned up-grade from the drifts, and as a rule are made about 30 feet wide. Ordinarily they are driven 300 feet and stop just short of the next pair of drifts. Where the grade is flat the cars are hauled up to the breasts, but as the grade increases this becomes impracticable. The coal may then be run down in small 'buggies' to the main drift, or as the inclination becomes greater, be allowed to slide down on sheet iron, or with the steepest dips be allowed to slide on the rock-floor itself. In the opening of an anthracite colliery the sinking of the shaft, the driving of the air and haulage drifts, the blocking out the chambers and the installation of the breaker and other surface works involve heavy initial outlay. The expense of installation is much greater than is the case with bituminous coal."

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence).—In the Nome field the most new work is being done in the neighborhood of Peluk, Martin's creek and Otter creek. More than a dozen steam thawers are at work on the creeks, which are situated about 2 miles east of Nome, and some very good prospects are being found. The Kougrook section, especially Dabi creek, is very much talked about at present; pans running as high as \$30 are sometimes taken out. Nevertheless, old prospectors of the Kougrook maintain this to be "only a small spot and will not last; they may work for 1/2 mile and find nothing after this spot is worked out."

The Inmatebuk river and Old Glory are being well spoken of and quite a number of stamperders went into that section to relocate ground. Gold Run benches are being prospected with very good results. Some parties (G. Selfert and associates) have done work on the benches late this fall and struck the pay channel. They had taken out \$14,000 with six men in ten days before the ground froze.

Coal is still maintained at \$35 per ton, although there seems to be a large supply on hand. The extortionate price is to be regretted, as it keeps many from working their claims. The price of bread was raised from 5 cents to 10 cents, but otherwise provisions are reasonable, with the exception of eggs, which sell at \$22 50 per case. Potatoes are \$5 per crate, fresh meats (frozen) 20 cents to 35 cents per pound, coal oil \$1 per case.

Nome, Dec. 12, 1902.

J. L. Parks, operating on Candle creek, reports to the Nome Gold Digger of much work being done this winter around Candle. Coal sells at \$2 per sack on the creek, but many of the miners are hauling their own coal from the ledge on Chicago creek, a tributary of Kougarok, 20 miles from Candle. The trail to the mines is good and with a good dog team they haul 1000 pounds per load. He says there are several steam thawers in operation in the district.

The Miocene Ditch Co.'s tunnel through the divide between Anvil creek and Snow gulch, near Nome, is being driven ahead at the rate of 2 feet per shift, with two shifts at work on both ends. It will be 1850 feet long and is 4x6 1/2 feet, the depth from the summit of the divide to the bottom of the tunnel being 100 feet. The Snow gulch end is in 860 feet and the Anvil end 560 feet. They expect to have the water turned in by June 1. The ditch on the Snow gulch side was cut last summer. The water is brought down to the divide near the head of Anvil and Glacier, from Hobson creek. Here the ditch forks, one fork going to Dexter, the other running along the left limit of Glacier to the tunnel at the head of Snow gulch. After passing through the tunnel it will be taken up Anvil on the right limit, thence around Anvil mountain to the head of Copper gulch. They will also supply Bourhon, Newton and smaller gulches, as well as all the claims on the benches and tundra below.

Speaking of the work around Anvil creek, the Nome Gold Digger says that near the head of Nicola gulch, on the Wild Goose Co.'s Lena claim, there is a steam hoist working the shaft 120 feet deep and fifteen men are at work. On the Snow Flake claim of the Beau Mercantile Co. they are drifting on the 130-foot level and have twenty men at work. Over the divide on the Dexter side, near the head of Grass gulch, Kelly & Co. have a steam hoist at work and are down 70 feet and drifting. There are several parties working quartz ledges on the right limit of Anvil.

The Olympia M. Co., operating on Woe-wodski Island, which lies near the North Wrangell Narrows, is working fifty men, says Superintendent E. E. Harvey. They are blocking out ore and it is proposed to install a mill in the spring.

Native platinum is reported found in the sluice boxes on Slate creek, 140 miles up the Copper river from Valdez.

Twenty wells will be drilled between June 1 and December 1 at Cook's Inlet by the English Co. which brought in a flowing well last year at a depth of 360 feet.

President W. Ebner of the Ebner G. M. Co., operating at Silver Bow Basin, on the mainland north of and opposite to Douglas Island, near Juneau, says they will add 100 stamps to their mill this year. They own eight claims, and the mine has been developed by a tunnel 900 feet long, giving a depth of 600 feet on the main ledge, which is 40 feet wide, of low-grade ore. They have air compressors, machine drills and a 15-stamp mill in oper-

ation, being worked by water power. The ore is free milling.

ARIZONA.

COCHISE COUNTY.

The El Capitan M. Co., working a group of claims near Walnut gulch, has bought a half interest in the J. W. Brown group of five lead claims, 18 miles north from Tombstone, in the north end of the Mule mountains, says Manager A. Grator.

The Dos Cabezas G. M. Co. expects to have its plant, near Dos Cabezas, in the Dos Cabezas mountains, in operation by April 1st, says the Review. Delay has been caused by the non-arrival of machinery.

COCONINO COUNTY.

The Malachite Copper Co., says Superintendent M. J. Runneville, has begun work this week on their group north of Williams.

GILA COUNTY.

A strike of ore has been made in the Alice mine of the Troy-Manhattan C. Co., near Globe, says the Silver Belt. On the 400-foot level, in a drift run in the contact, and at 140 feet from the shaft, 9 feet of black sulphurates were cut which assay \$17 in gold and 15% copper. They have drifted on this body of ore for 30 feet. On the Manhattan side the ores show values in gold.

GRAHAM COUNTY.

Superintendent Crowley, of the Antietam mine, near Clifton, says the crosscut from the shaft has been run 40 feet, 20 feet of which is in smelting grade copper ore.

The Polaris Co. last week took up its option on the Evans Point millsite, near Clifton, which includes the 20-stamp mill and pumping plant, and several buildings.

MARICOPA COUNTY.

J. B. Barnett, D. A. Murphy, J. B. Forbes and H. J. O'Brien of Kansas City have bought the Humphrey group of twenty-five claims, 3 miles east of Morris-town.

Manager Witherlay, of the Socorro mine, near Wickenburg, says the mill is in operation and the cyanide plant will be completed next week. They have 100 men at work.

MOHAVE COUNTY.

The Elkhart mine, near Chloride, is shipping seven carloads of concentrates per week from the mill, says Superintendent Barmora.

H. N. Botsford, superintendent of the Tennessee mine, near Chloride, says the company will resume operations at the mine on the 15th inst. The main shaft will be sunk several hundred feet deeper.

The Mohave County Miner says Hayden, Stone & Co., of New York, have bought the Sheeptrail group, near Kingman. The property consists of the Sheeptrail mines, 20-stamp mill, hoisting and air compressor plants.

Lumber and machinery are on the ground for the mill of the Mohave G. M. Co., near Spear's lake near Kingman. The mill will have forty stamps and will handle 120 tons daily.

PIMA COUNTY.

A. H. Emanuel has been appointed receiver for the Copper Belle M. Co., near Tucson, which was declared bankrupt by the court last week, says the Review.

Last week fifty mineral locations were filed on claims near Douglas, says the Review. Several parties found quartz at the foot of Nigger Head assaying \$10 in gold, 4 1/2% copper and 10% lead.

Men are at work on the Yellow Jacket mine, near Tucson. The water is being pumped out. The Old Glory mine has been bonded to Baker & Co. of Michigan, and operations begun. Work has started on the Yellowstone group, owned by H. F. Diehl, and adjoining the Oro Blanco mines near Tucson. The Sierra M. & M. Co. are opening up their lead-silver mines in the Sierrita mountains, near Tucson.

PINAL COUNTY.

Foreman Wilson of the Copper Buttes mine, near Florence, says he has struck a body of iron ore in the tunnel he is driving on the main ore body and that this iron ore carries values in gold.

A bond has been given on the Box Canyon gold mines to Carr, Provand and Cope. One of these claims has been prospected to a depth of 100 feet by two shafts sunk on the vein and connected at the bottom by a 150-foot drift. The ore, it is said, can be treated by cyanide. The group is 18 miles northeast of Florence, in the Mineral Hill district.

A. M. Womble of San Francisco, Cal., is examining the ore outlook around Tucson, with the intention of establishing a smelter and reduction works, says the Tucson Star.

YAVAPAI COUNTY.

At the Monica mine, in Weaver district,

near Prescott, an 8-foot ledge of free-milling gold ore assaying \$10, with some silver, has been cut. The owners—T. Ernhart, E. B. Corbell and F. E. Howe—propose to install a stamp mill and other machinery.

It is reported a body of ore has been struck in the Boggs mine, near Prescott, which carries one ounce gold per ton, ten ounces silver and 4% copper.

G. W. Hull says he has men drifting both ways on the ore body struck in the Dillon tunnel, near Prescott, and that they are taking out ore for shipment.

Superintendent Pickrell, of the Gold & Copper Con. M. Co., says their quartz mill and cyanide plant, at their President group of mines in Hassayampa district, near Prescott, are in operation.

F. Giroux and I. Salinger, operating the Victor mine, near Walker, will put in a mill of forty tons daily capacity, in addition to the one now in operation.

Superintendent Simington, of the Grand View group on Cherry creek, near Prescott, says he had a test run of their ore made last week through the quartz mill of the Monarch Co. which returned \$7 free gold; the concentrates assaying \$62 gold, \$1.90 silver. The principal development work on the Grand View group has been done on the Rattlesnake, the central claim of the group, which has a shaft down 170 feet and a drift from the 100-foot level 100 feet in.

CALIFORNIA.

AMADOR COUNTY.

The long-pending suit between the Argonaut M. Co. and the Kennedy M. Co., at Jackson, has at last ended, the Supreme Court of the United States having rendered a verdict in favor of the Argonaut M. Co. (plaintiff). The Argonaut, which has been worked only intermittently for a year or more, will now begin active operation on the block of ore so long in dispute.

Sinking the main shaft at the Oneida mine, near Jackson, is down 2200 feet, and it is the intention to sink to the 2500-foot level, says the Dispatch.

Operations at the Sargent mine, near Jackson, have stopped for the time being.

At the Kennedy mine, near Jackson, 20 stamps of the new mill are ready for operation and the concentrators are being set up. It is the intention to run the mill by electric power. It is proposed to start these 20 stamps as soon as possible, in connection with the present hoist. The new hoist will be ready by May 1st. It is of 1000 H. P., and has capacity of hoisting 10.0 tons of rock per 24 hours, hoisting 3 tons per load. J. F. Parks is superintendent.

CALAVERAS COUNTY.

A dredger is to be put in on the Calaveras river near Jenny Lind, by W. H. Hammond & Co. of Oroville.

At the Duchess mine, situated above Parrott Ferry on the Stanislaus river, near Vallecito, a wire rope tramway has been installed to transport ore from the tunnel to the mill.

The Angels Record says the 60-stamp mill at the Utica mine at Angels is soon to be taken down and added to the Stickle mill of the same company. The oil tank at the chlorination works is completed and the burners are being put in and pipe connections made with the furnaces.

The Nelson Contracting Co., operating the hydraulic mines at Calaveritas, made a partial cleanup last week with satisfactory results, says Manager Nelson.

Last week the Fanny Marie Co. began work on the C. A. Berry mine at Glencoe.

FRESNO COUNTY.

The Home Oil Co. at Oil City, near Coalinga, has had its wells cleaned out and put under the pump.

INYO COUNTY.

A. A. Casler has bought the Gold Bug, Golden Reef, Hardscrabble, Indian Queen, Eclipse, Ophir and Rustler claims at Fish Springs.

The International Equipment Co. of Los Angeles have bought the Ratcliffe mine, near Ballarat, and will equip it with new machinery.

KERN COUNTY.

The Breadwinner M. Co. of Los Angeles, owning the Cowboy mine near Caliente, are arranging for a 40-stamp mill.

The Big Blue M. Co. at Havilah have found steam more expensive than their water power, and are going to re-establish their water power plant, says the Randsburg Miner.

Another Sunset producer was brought in last week by the Shafter well, east of the Queen, and while the casing is being sunk deeper into the oil sands the well is flowing at the rate of 200 barrels per day.

The St. Paul & Sunset Oil Co. will build a 100,000-barrel reservoir in Sunset and sink more wells.

The California Con. Oil Fields Co., or-

ganized under the laws of Maine to control the output and business of the Sunset and Midway fields, filed its papers with the county clerk last week. The following are directors: S. Jewett and H. A. Blodgett of Bakersfield, E. W. Guptill, L. L. Light, H. P. Sweetser of Portland, Me.

The Silver Star, a San Francisco company, has struck oil in its first well at McKittrick, says the Californian.

The Southwestern Refinery Co. is pushing work on its refinery at Kern river, near Bakersfield. Material for the stills and machinery is on the ground. The capacity of the refinery will be 12.0 barrels a day.

The Friday mine, at Havilah, is reported to have produced over \$200,000 down to the 125-foot level, where water was encountered. Since then the shaft has been retimbered from top to bottom; a steam hoist, a new 25 H. P. hoisting engine, a 30 H. P. boiler and a pumping plant have been installed. The shaft will be sunk several hundred feet; J. Hayes, superintendent.

The 300-mile pipe line constructed by the Standard Oil Co. from Bakersfield to Point Richmond (Contra Costa county), on San Francisco bay, is completed. It is expected they will be pumping oil from the Kern county fields by April 1st. The first tests of the line were begun this week at the Kern river end. The test is by water forced through the pipes at 100 pounds pressure per square inch. The line is divided into ten sections, with a pumping station every 28 miles. The speed at which the oil can be moved will not be determined except by actual transportation in the regular order of business. The oil is very thick, but heating it is expected to permit it to run readily after it is set in motion by the pumps. The pipe line will insure a supply of crude oil at the refining plant of the Standard Oil Co. at Point Richmond.

LASSEN COUNTY.

Some of the miners at the Golden Eagle mine, on Hayden Hill, having organized a union, have demanded that the company employ union men only, and, not meeting with a prompt affirmative response, went on strike.

LOS ANGELES COUNTY.

The 2-stamp mill of the Mesquite Ore and Reduction Works, Mission road, East Los Angeles, began operations last week. It has a capacity of 8 tons daily. The Mesquite Co.'s claims are in San Diego county. The capacity of the plant will be increased as soon as the development work opens up more ore.

MONO COUNTY.

The mill at the Lydia mine, near Benton, has been closed down temporarily owing to the freezing of water pipes.

H. W. Nelson, superintendent of the Copper Mountain mine and reduction works on the shore of Mono lake, 5 miles from Lundy, says work is temporarily suspended on account of severe weather.

NEVADA COUNTY.

The Oakland mine (formerly known as the Golden Gate), on Rattlesnake ravine, 5 miles from Grass Valley, will be reopened, says J. V. Bennetts, the principal owner.

PLACER COUNTY.

The Enterprise mine at Iowa Hill is being prospected by Gilmore Bros. The tunnel is in 400 feet and paying moderate wages to the men who are working, says the Sentinel.

V. C. Gorst, who has a lease on the Green Emigrant, on the Pike Bell place, in Rock Creek, near Auburn, report taking out \$600 in two pans, down 30 feet last week.

PLUMAS COUNTY.

It is reported the Standart & McGill mine near Greenville, and owned by Eastern men, will begin operations by April 1st.

SACRAMENTO COUNTY.

The Boulder M. Co. has begun operations on Carson creek, near Folsom, with G. Bigger as superintendent.

The Sacramento & Rescue M. Co. is operating its mines on the Hale group, near Folsom.

SISKIYOU COUNTY.

J. Grayson, owning the Punch Creek quartz mine on Humboldt creek, near Hawkinsville, is putting up a water wheel for power to run pumping machinery in order to sink shaft deeper. A 10 stamp mill will be installed this spring and will be operated by power from the Siskiyou Electric Power Co.

Coal is being taken out at the coal mine on the Herr ranch between Yreka and Ager, and they are down 800 feet. During the coming summer arrangements will be made for shipments.

J. McKeen, superintendent of the McKeen mine, near Etna, says their machinery plant is in operation and has men

working in Nos. 1, 2 and 3 tunnels driving on the ledge. The mill will be started up this week. The cyanide plant was enlarged last summer, giving a capacity of seventy tons of ore daily.

At Oro Fino last week Chaplain & Picard bought the Old Dan Manning quartz mine for \$1500, and will begin development work next spring.

The Schroeder mine at Deadwood, Superintendent McLean, and the Rusby, Superintendent Connors, are doing development work.

Superintendent Phillips of the McKinley mine at Deadwood, says he will build an arrastra as soon as weather conditions are favorable.

The Brokaw mine at Greenview has closed down for the season, says the Farmer and Miner, and heavier pumps will be put in in the summer.

The Jilson quartz mine, near Henley, is being worked with thirty-five men, and the mill will be started up next week, which will require additional miners.

Work has started at the New York mine on Indian creek, near Yreka, says the Journal.

W. Lindsay of Portland, Or., has men at work on the Finley & Johnson mine, on Russian creek, near Etna.

TRINITY COUNTY.

J. J. Chambers of Redding has an option on the Lappin group of mines near Deadwood and will begin work this month. Machinery will be put in and a tunnel run to cut the ledge at depth and drain the mine. From 250 tons of ore from the Lappin crushed in the Brown Bear mill last summer \$8200 was netted.

TUOLUMNE COUNTY.

(Special Correspondence).—Owing to late developments in the App mine at Quartz, W. A. Nevills says he will add forty stamps to the mill. Large ore bodies have been cut on the 1100 level, in the east or hanging wall schists of what is generally considered the mother lode or ankerite vein.

The Campo Seco shaft is down 110 feet and sinking with two shifts. The bottom of the shaft is in quartz carrying auriferous iron sulphides. At 150 feet a second level will be opened, when, if developments are satisfactory, a mill will be built. J. H. Hall is superintendent.

On Nigger hill Superintendent Pinney is sinking the shaft recently reopened. The surface of this hill has a score or more of shafts, tunnels and pits made by pocket hunters, with the result of the finding of several thousand dollars in gold. The present is the first attempt to systematically develop the property. Sinking is being done by means of a windlass, but a hoist is to be put in.

The Harvard is running steadily, operating only the south shaft.

W. A. Nevills says that chlorination at the Rawhide is to be discontinued in favor of the cyanide process, as by the former the cost is from \$7 to \$9 per ton of sulphides treated. Experiments have demonstrated that by finer crushing a high extraction can be effected by means of the cyanide process at a cost of about \$2 per ton.

Jamestown, March 10.

The Keltz mine, near Columbia, has closed down, says the Magnet.

At the Mazeppa mine, at Stent, operations were closed down last week, says the Magnet, pending the addition of ten stamps to its mill.

A Cornish pump has been put in at the Draper mine, near Soulsbyville.

A new furnace is being built at the Shawmut chlorination plant, near Chinese, says Superintendent C. L. Uren.

Superintendent Morrison has resumed at the Crystalline and development work will be increased. The mill is in operation.

Manager M. B. Kerr of the Jumper Mine Syndicate, at Stent, says other operations are suspended while the stopes which recently caved are being filled and caught up. The 500-foot level drift is within 200 feet of the Golden Rule, and when connection is made the Golden Rule rock will be run through the Jumper mill. He expects to resume full handed April 1st.

The Ellen Winton Extension mine, near Groveland, has been sold to the Ellen Winton G. M. Co.

W. H. Dennis has bought a quarter interest in the Ballarat quartz mine, 1 mile east of Columbia.

Superintendent Van Syckle has men at work reopening the Mayflower mine near Carters. There is a 2-stamp mill on the mine.

The Puerto Fino mine, near Carters, will reopen May 1st, says the New Era.

At the Mt. Jefferson mine, near Groveland, the shaft reached the 500-foot point last week; a station has been cut and drifting begun.

After a temporary shut-down the mill on the Star mine, east of Columbia, was started up last week.

Fifty men are on the pay-roll at the

Densmore mine, near Columbla. The 10-stamp mill and the 2-stamp batteries are in operation.

The Punter mine, near Sonora, under bond to H. J. Dykes, has been equipped with boiler and pumping machinery, and operations will begin next week.

Operations in the Mazeppa mine, at Stent, ceased last week pending the addition of ten stamps to the mill.

COLORADO.

BOULDER COUNTY.

At Rowena the Prussian mill is in operation after being enlarged, using the process of the National Automatic Furnace M. & M. Co., which consists essentially of roasting and cyaniding, says the Gazette.

Drills, air compressor and other machinery have been added to the equipment at the Graphic mine at Magnolia.

CHAFFEE COUNTY.

The Ohio & Colorado smelter at Salda is running full capacity. They have six lead-bullion furnaces with a capacity of 150 tons per day each, one matte furnace of 350 tons per day capacity and one smaller bullion furnace for refining matte from the furnace and the matte product from the bullion furnaces. Work on building the twelve roasters is under way.

CLARK COUNTY.

The final payment of \$10,000 on the Lombard-Polaris group at Yankee has been made by the Yankee Con. M., M. & T. Co. of Denver; H. I. Seeman, president. A 50-ton mill will be installed in place of the 5-stamp mill on the ground. The company will sink a vertical shaft on the Lombard and near the porphyry dyke. The first level from the shaft will be made at 100 feet and will run east under the present lowest workings, giving a vertical depth of 400 feet from the surface. In the meantime the Manhattan tunnel is being driven toward the Lombard group, which will be cut at 1000 feet deep. The company owns eighty-six claims.

J. R. Elgan, manager of the New Era Co., near Idaho Springs, says the mill is in operation. He is driving the levels ahead with machine drills and has opened up a body of milling ore.

The Santa Fe Co., operating the Gold Treasure group in Cascade district, near Idaho Springs, report opening into 5 feet of ore running \$30 a ton, with bunches of smelting ore. The ore carries gold, copper and lead. A winze is being sunk from the adit level. The same company has made final payment on the Santa Fe mine, on Seaton mountain, and have men at work stopping and drifting.

The Omar Co., driving a tunnel in Hamlin gulch, near Fall river, has struck the Paris vein at a distance of 600 feet, showing 6 feet of \$30 ore with a percentage of lead. The company will begin drifting on this lode and install machinery for further development.

W. H. Metz, president of the Centurion Tunnel Co., near Idaho Springs, says the tunnel is in 230 feet. This company owns twenty-two claims, and last week bought the Summit, Champlon and Comstock lodes on Mt. Donaldson. The Centurion tunnel is expected to cut the Champion vein within the next 100 feet at a depth of 150 feet below its present lowest workings. At 650 feet farther in the Donaldson vein will be cut, which will give a depth of 1000 feet from the surface. The property will be equipped with machinery, including a compressor.

The Indiana G. & S. M. Co. is driving an adit on the Jew lode, near Georgetown. The Treasure Mountain M. Co. has incorporated, to operate the Mary Ann group of mines at the head of Geneva gulch, near Silver Plume; to build and operate a concentrating mill on Geneva creek, near the mines, and to build smelting works near Denver. The company owns eight claims, including the Mary Ann and Lady Louise, extending 3000 feet on the Rathbone vein. Extensive development work has been planned, including the opening of a vein of iron ore carrying values in gold and silver, the sinking of a double compartment working shaft on the Mary Ann and driving a crosscut tunnel to open a series of veins which outcrop on the group. At the same time work will begin on the mill and smelter. C. C. Goodale, V. B. Straight, E. C. Gard of Denver, and H. F. Best and T. S. Reed of Savannah, Mo., are the incorporators.

CONEJO COUNTY.

The Conejos Oil Co. of Denver will start drilling in its well near La Jara next week and expect to go to 2500 feet.

FREMONT COUNTY.

The Isle G. M. Co. are preparing plans for a mill to be built at the Isle lead mine, southwest of Florence. The capacity of the mill will be 500 tons of ore a day.

GILPIN COUNTY.

The Straughton claim, in Illinois gulch, near Central City, has been taken under lease and bond by a local company. They will sink the shaft deeper. The Carcasonne Co. is opening up the same vein on their Deldrick claim.

The Gauntlet G. M. Co., owning and operating the Gauntlet and the Matt France lodes in Illinois Central district, near Central City, will sink the Gauntlet shaft an additional 200 feet to the 500-foot point. L. D. Hobson is manager.

It is reported the Gettysburg M., D. & M. Co. will resume operations at its Gettysburg group in Lump gulch, near Rollinsville, April 1, with A. M. Willard as manager. The Gettysburg shaft is down 215 feet, with 300 feet of levels driven.

Eastern parties interested in the Copper King mine in Leslie gulch, on South Boulder creek, near Rollinsville, F. Gooch superintendent, are arranging to resume operations.

The Hastle interests in a lease and bond on the Waltham mine in Willis gulch, near Central City, have been sold to Tanner, Carlson & Anderson of Idaho Springs, who will erect a shaft building and install machinery for further development work. The shaft is down 160 feet.

At the Pierce mine at Central City the shaft on the south vein is down 125 feet and connections have been made with the first level of the old shaft, says Manager E. M. Messiter.

The Register-Call says considerable placer mining will be carried on in the Gamble, Lump and Moon gulches during this season, as well as on South Boulder and Beaver creeks.

LAKE COUNTY.

Manager H. Dyatt, operating the Peerless Maud mine in Horseshoe district, near Leadville, says at a depth of 140 feet in a drift extended from the shaft he struck a body of lead carbonates, carrying 40% lead and 30 ounces silver, with some gold. The ore is similar to that he found recently in the Peerless adjoining.

J. McAllister has taken a lease and begun operation on the Park lode, near Leadville. The Park lode is east of the Mike fault and northeast of the Louisville and Moyer mines. He is shipping the product to the smelter and at a depth of 200 feet expects to take out a large tonnage.

The Fryer Hill M. Co., at Leadville, has begun shipments of low grade ore from the Stiver mine to the Arkansas smelter. This is an iron ore for which up to the present time the company has found no market.

The Chrysolite mine, near Leadville, being operated by J. Hume et al, is ready to ship a large tonnage as soon as the D. & R. G. build a spur into their ground, which will be done this month, says the News-Dispatch.

MINERAL COUNTY.

Superintendent Westlake has 200 men at work in the Big Kanawha mine, near Creede, breaking ore for the mill, which is crushing 300 tons daily.

PARK COUNTY.

A flow of gas is reported struck last week in the Olive oil well in South park, near Alma, at a depth of 1000 feet, on the property of the Illinois-Colorado O., G. & C. Co. of Chicago. The first 1000 feet of the well had been cased and drilling resumed.

The strike made in the South London tunnel, near Alma, last week has developed 3 feet of ore showing values of six ounces gold and twelve ounces silver per ton. Shipments have begun.

PUEBLO COUNTY.

The Pueblo Electric Metallic Extraction Co. has incorporated at Pueblo to operate in Fremont, Custer and Teller counties, using the Johnson process; J. H. Johnson, J. W. Tanner and C. H. Dolly.

SAN JUAN COUNTY.

The mines of the Cleveland Con. M. Co. will be reopened. This group is 3½ miles below Silverton, on the southeast side of Sultan mountain, and consists of five claims.

The Silver Ledge M. & M. Co. expect to have their new mill near Silverton in operation this month and will produce three carloads of concentrates a day. Twenty men are at work preparing to break down rock. J. B. Warner, manager, says the mill will start up as soon as sufficient water supply is available from the melting of the snow.

Work on the Congress mine, above Chattanooga, near Silverton, has been resumed by the Congress C. M. Co., composed of Boston men, with G. H. Foltz as manager. The mine is worked through a shaft and one tunnel 210 feet long, cutting the bottom of the shaft. Since this tunnel was driven the shaft has been put down 75 feet, showing a body of copper ore, shipments from which gave returns

of 18% copper, one ounce gold and twenty-five ounces silver.

The Gold Queen M. Co. was incorporated last week; G. W. Crawford, H. Riddle, W. E. Bridgman and H. J. Mayham, to open up a group of claims in upper Cement creek district, near Silverton.

The Cella Kilroy mine, on the Cement creek side of Anvil mountain, near Silverton, is being worked by H. Born. The tunnel is being driven ahead and at 275 feet it is expected that the vein will be reached 75 feet under the shaft.

The Silver Lake mill, near Silverton, is producing 60 tons of concentrates per day says the Standard.

The Mammoth Tunnel Co., A. A. Brown manager, has bought the Lead Carbonate group, Cement creek, near Gladstone, southeast of the Gold King mine. The Mammoth Company will begin development work next week. A shaft will be sunk 500 feet on the Hercules, and a tunnel run 1200 feet, which will open up the entire group. An air compressor and drill machines will be put in.

SAN MIGUEL COUNTY.

The 50-stamp mill at Ophir Loop of the Ophir Con. M. Co., W. S. Buckley manager, is treating an average of 150 tons of ore per day. The ore carries values in gold, silver and copper.

Manager Anderson of the Nellie and Ella mines in Bear Creek basin, near Telluride, says a portion of the 125 stamp mill has been employed during the winter in test runs to determine the values carried and the possibilities of recovering and retaining the same. Last week the mill shut down for general repairs, but will resume by April 1, dropping forty stamps to begin with. He has fourteen miners at work retimbering portions of the mine.

On the 3d inst the electric transformer house, blacksmith shop and other buildings at the Pennsylvania tunnel of the Smuggler-Union Co., near Telluride, were destroyed by fire.

TELLER COUNTY.

Construction work has begun on the cyanide mill of the Gold Mining and Reduction Co., which has leased the National sampler at Goldfield, to be converted into a cyanide plant. The plant will be equipped with four 100-ton tanks. The Globe Co. has a lease on the Ironclad mine, on Ironclad hill, where an experimental cyanide plant has been in operation for several months past. The ore in the mine averages \$5 per ton.

The Virginia M. G. M. Co. has granted a lease on the south 465 feet of the Lincoln claim on Gold hill, Cripple Creek, to E. W. Bowditch and E. W. Clawson, of Cripple Creek, on 20% royalty.

The Shannon G. M. Co. has leased the south end of the American Beauty claim, near Cripple Creek, to Thayer Brothers of Cripple Creek. The lease is at graded royalties, 15% on ore under \$20 per ton and 20% on ore \$20 per ton or higher. The north end of this same claim is under lease to G. C. Blake and J. H. Witt, who have a shaft down 150 feet. The American Beauty claims on Gold hill, adjoining the Jack Pot group.

The Potvin & Hatfield cyanide mill, on the site of the old El Paso mill, being built to treat the tailings dump, will be in operation next week.

The Sioux Falls & Cripple Creek M. Co., driving the Fort Wilcox tunnel into Copper mountain, near Cripple Creek, with machine drills, are in 1000 feet. The company will install a cyanide mill at the mouth of the tunnel to treat the low-grade mineral already exposed.

Two separate plants of machinery will be added to the equipment on the Jerry Johnson estate, on Ironclad hill, Cripple Creek, this month. Levison & Co. of Denver have a two years' lease on the Arapahoe claim and will put up a steam hoist. These operators will pay a graded royalty on all ore marketed, and will sink the shaft from 140 feet to 300 feet from which point they will prospect for the Pullen vein. Blocks Nos. 3 and 4 of the Arapahoe have been leased to Miller & Peterson, who will sink an additional 100 feet from the present depth of 100 feet.

The Ajax mine, on Battle mountain, near Cripple Creek, is shipping 60 tons daily of milling grade ore.

The Granville lease on the C. K. & N. mine at Cripple Creek produced in February 800 tons of ore of average value of \$50 per ton, and in January 1004 tons, averaging \$60 a ton, were taken out. The February tonnage decreased because of the interference of water which prevented operations in the 355-foot level. The water rose 20 feet above this point, but is being lowered at the rate of a foot a day by the pumping going on in the El Paso mine adjoining. The El Paso is running southwest on the C. K. & N. vein and they are 450 feet from the Raaser side line.

Machinery has been installed on the Addie C. mine, on Mineral hill, Cripple

Creek, and sinking resumed. The shaft is down 458 feet, and will go to 1000 feet. Heavier machinery will be installed at the Blue Flag mine, on Raven Hill, Cripple Creek, says Manager Erloman. It is the intention to sink the shaft to greater depth.

It is reported work will be resumed on company account on the Caledonia mine, on the south end of Bull Hill, Cripple Creek.

O. B. Finn & Co., who have the lease on the Magna Charta, on Ironclad hill, Cripple Creek, have started operations in their experimental cyanide mill, handling ten tons of ore a day.

The Times at Cripple Creek says the Arcqua mill has been leased to the King-Craig Metal Extraction Co., of Milwaukee, Wis. It is the intention to improve the mill and enlarge its capacity.

The Ivanhoe claim of the Greater Gold Belt Co. on Globe hill, near Cripple Creek, is to be equipped with an experimental cyanide plant, says Mrs. Thomas, lessee. There is water in the shaft up to the 110-foot level, which level, however, can be worked without hoisting water.

The Valley City Co., operating the Shurtloff mine on Bull hill, Cripple Creek, are sinking the shaft from 900 feet to 1000 feet. The vein has been opened up in the tenth level at a depth of 800 feet, and is showing 8 feet wide.

Babbitt & Murphy, operating a lease on the Buena Vista of the Isabella Co. ground at Cripple Creek, are installing a hoisting plant on the incline shaft and will use a skip for hoisting the ore.

Work has resumed by the Star G. M. Co. on the Commonwealth on Beacon hill, Cripple Creek. They are sinking the shaft and driving to make connection with the 400-foot level of the Star shaft and the Dan McDonald on Guyot hill. The 400-foot level of the Star shaft is under the Dan McDonald shaft, and there remains 35 feet of upraising to be done. Ore has been opened in the two bottom levels of the Star, the 300 and 400-foot levels.

IDAHO.

BLAINE COUNTY.

J. Tehe, M. Welch, E. Inama and P. Welch, working the Golden Crown claim of the United Mines Co., on Little Rock creek, near Hailey, have the shaft down 80 feet in good ore. Tehe says too much water is coming in for a windlass, and that a hoist and pumps will be put in.

CUSTER COUNTY.

It has been announced that the smelter of the White Knob C. Co. at Mackay will be started up June 1st.

The Vishnue group of mines on Custer mountain, near Custer, are reported sold to a Tacoma syndicate headed by H. Hewett, Jr., for \$15,000.

IDAHO COUNTY.

J. L. Johnson, president of the Elk G. M. & L. Co., composed of Wallace and Wardner men, has begun work on their group on Red Horse creek, near Elk City.

D. Mackenzie & Co. have bought the Irwin, McGarry, Myer interests in the Bullion group, Thunder Mountain district, near Thunder, says the Signal. The group consists of nineteen claims at the head of Holy Terror creek, a tributary of Monumental creek, and is 1 mile east of the Dewey mine.

The Barton, Brizendine and Yates claims, on Smith creek, near Thunder, adjoining the Wordenhoff properties of Hollister & Co., have been sold to H. L. Hollister for \$17,000.

J. B. Laughlin of Pittsburg, Pa., part owner of the Lucky Boy mine, near Welsch, has temporarily suspended operations at the mine.

KOOTENAI COUNTY.

Operations are resumed on the Mexico mine, at Black Tail mountain, on Lake Pend d'Oreille, near Sandpoint, says Manager Ferguson. The Wisconsin M. & M. Co., E. L. Bump, F. L. Hudson and J. W. Bishop, of Warsaw, Wis., and J. Ferguson, incorporated to operate this group. A shoot of carbonates was opened up on the Mexico, yielding \$60 per ton, chiefly in silver, and gray copper was also found.

OWYHEE COUNTY.

J. E. Mosher of San Francisco, Cal., has bonded the Banner group of claims on Florida mountain, near Silver City.

SHOSHONE COUNTY.

Manager Young of the Silver Cliff copper mines, near Wallace, says the company is planning the erection of a mill.

The New Jersey G. Co., operating at the mouth of Big creek, below Osburn, will install a 10-stamp mill in the summer. A 2-mile flume has been built to bring in a water supply. Electric power from the lines being run from Post Falls has been contracted for.

At the O. K. silver-lead mine in Government gulch, west of Wardner, a 4-foot

body of shipping galena was cut last week while driving a raise from the 200-foot level. The entire ledge is 12 feet wide and carries concentrating ore. The upper tunnel has been driven 400 feet. Near its mouth a shaft was sunk 200 feet, and from bottom of shaft a drift run on vein 650 feet, entire length being in concentrating ore. The company has decided to sink the main shaft 200 feet deeper. It was decided at a recent meeting to build a concentrator this spring on their millsite on the river, a mile below the mine.

The Western Star-Big Creek M. Co. has been incorporated by G. W. Sparenberg, S. Teichle and H. Loeber of Wardner and H. J. Rossi, T. Riddle and S. P. Fairweather of Wallace. Their claims are near the mouth of Big creek, east of Wardner.

MICHIGAN.

The results at fifteen mines in the Lake region for February show that 24,500 tons of rock were stamped daily, producing 333 tons of refined copper.

HOUGHTON COUNTY.

The February product of the Atlantic mine, near Houghton, amounted to 298 tons, the greatest February product in the history of the mine. The rock is yielding 17 pounds of mineral per ton. The Wolverine output was 485 tons and the Mohawk 354 tons.

The Baltic mill, near Houghton, started up the fourth head of stamps last week.

The annual report of the Atlantic M. Co., near Houghton, for the year 1902 shows production of mineral of 6,847,270 pounds, yielding 72.28%, or 4,949,366 pounds of refined copper, for which there has been realized 11.88 cents per pound. The mineral produced by this mine is mass copper.

J. R. Stanton, treasurer of the Winona M. Co., near Houghton, says: The development work of the past year in the ground south of No. 2 shaft has opened up a lode of such a character as to warrant further explorations in that direction. For a working test of the rock, one head of stamps in the Atlantic mill was leased, and during the months of December and January, 8795 tons of rock were stamped, which yielded 23 pounds of ingot copper per ton.

KEWEENAW COUNTY.

The Ahmeek, near Allouez, has struck the Kearsarge amygdaloid in the vertical drill hole from the bottom of the small vertical shaft at a depth of 214 feet, and showed a width of 15 feet. A crosscut is being run to intersect the lode to the east from the bottom of the shaft at a depth of 100 feet and is expected to strike the lode in 140 feet. Fourteen feet before the true lode was cut, the west or minor Kearsarge was struck, proving the identity of the lode as found in the north Kearsarge and Mohawk.

The Fort Federal Copper Co., organized at Duluth, Minn., has bought 3600 acres east of the Misawabic and 1 mile southeast of the Phoenix mine, near Phoenix. L. L. Hubbard is consulting engineer.

MARQUETTE COUNTY.

The Copper Range management is preparing to begin active work on the smelter, near Marquette, west of the old Atlantic millsite on Portage lake. G. Case, of Butte, Mont., will superintend erecting the smelter and its operation. The capacity will be sufficient to handle mineral from all the South Range companies.

MISSOURI.

JASPER COUNTY.

The output of the American Z., L. & S. Co. at Carthage for the week ending Feb. 28th is reported by C. W. Landrum, superintendent, as follows:

	Lbs.	Value.
Zinc.....	10,511,630	\$161,600
Lead.....	1,029,830	29,385
Total.....		\$190,985

The following is the output for nine weeks:

	Lbs.	Value.
Zinc.....	76,077,770	\$1,187,173
Lead.....	9,150,890	233,314
Total.....		\$1,422,487

MONTANA.

DEER LODGE COUNTY.

The Cable gold mine, in Georgetown district, west of Anaconda, is in operation and twenty stamps are dropping.

FERGUS COUNTY.

Articles of incorporation of the Judith Basin M. Co. were filed last week at Lewiston; G. W. Cook, G. J. Bach, A. G. Steinberg, E. H. Cook, A. C. Bach.

The Gold Reef mill, near Lewiston, resumed last week, after a temporary shut-

down to increase its capacity. They are working 300 tons per day.

D. Scott, manager of the Mammoth Group G. M. Co., near Gilt Edge, says their mill is in operation and handling fifty tons of ore per day. They have opened up the ore body 200 feet long, 25 feet wide and 20 feet high, which averages \$8 per ton.

LEWIS AND CLARKE COUNTY.

The Iowa M. Co. has incorporated at Helena; R. W. Hughes, P. B. Merritt, I. H. Adams and J. E. Himmill.

PARK COUNTY.

The Bonanza Hydraulic M. Co. has been incorporated by H. J. Miller, H. Dyer and W. M. Carr of Livingston to operate in the Bear Gulch mining district.

SILVER BOW COUNTY.

The output of the Anaconda mines at Butte is 5200 tons of ore per day, but the quantity treated is in excess of that amount, as the company buys custom ore. The larger part of the ore taken out at the company's mines in Butte goes to the Washoe smelter at Anaconda, but a large tonnage is treated at the Butte & Boston and Colorado smelters, owned by the Amalgamated Co.

Machinery for the Pittsburg M. Co. mill near Butte is on the ground, says Superintendent F. Farrell. The mill will use the Bagley process. In addition to the mill there will be a wire and sheet copper factory.

NEVADA.

ELKO COUNTY.

The Leonard Taylor M. Co. has bought the A. H. Smith mine, near Tuscarora, including the 10-stamp mill and cyanide plant. Electric power will be installed and the mill capacity increased.

A 50-ton milling plant will be installed at the Deer Creek group, 8 miles east of Gold creek. A body of gold-silver ore has been blocked out, says Manager A. Carlson.

Pittsburg men have bought the Nelson mining property near Mountain City. It is intended to install a 60-stamp mill.

HUMBOLDT COUNTY.

The Glasgow & Western Exploration Co. smelter at Golconda has been blown in, says J. Farren, superintendent. At the Adelaide group he has 100,000 tons of copper ore ready to be treated, and at the Star group on Cherry creek the ledge has been opened up to a depth of 700 feet.

J. P. Fitting, of Foltz, is putting in a hydraulic plant on the properties owned by J. B. Foltz, of Foltz. Storage reservoirs will be built and the water used in washing restrained by dams. This year the abundance of snow assures a good supply of water.

The Nevada mine, in Donnelly Mountain district, on the west side of Black Rock desert, is reported sold to J. H. Harp and W. Ross. The mine produces some specimen-gold rock.

LINCOLN COUNTY.

The Southwest M. Co. of Philadelphia, operating at El Dorado canyon, has a 25-stamp mill on the Colorado river. The company is doing development work and intends later on to move its mill up to the mines. They have a whim in operation on their Wall Street claim.

At Knob Hill, 18 miles north of Searchlight, Hare & Hunsaker will put up a mill on their property.

The Horseshoe mine and mill, near Fay, have been sold to the owners of the Charley Ross and Buck mines. A double-compartment shaft will be sunk on the Buck vein.

NYE COUNTY.

(Special Correspondence).—The Paymaster mine on Lone mountain, 27 miles from Butte, has made a strike. The ore is reported increasing in quantity and value. The vein at present is 18 inches wide, lying between a lime foot and a porphyry hanging wall. On the foot there is a streak of galena 8 inches wide, which assays 275 ounces in silver, and next to that a 10-inch quartz streak assaying as high as \$65 in gold and 254 ounces in silver. The shaft is down 62 feet and sinking will be continued. J. Zweifel is superintendent.

The Indiana properties, 1 mile east of Butte, are sinking a double-compartment shaft. The work will be continued by windlass until their new 40 H. P. hoist arrives. F. Dunn is superintendent.

The California-Tonopah Co. are sinking a shaft to the 500 level and will then crosscut for the vein cut at the 145-foot level, where it was 30 feet wide. J. W. Donnelly is superintendent.

Sinking has been resumed from the 600 level on the Desert Queen shaft of the Belmont M. Co. Same will be sunk to the 800 level. J. J. Jordan is superintendent.

The Nevada-Alpine M. Co. are shipping 3000 sacks of ore per month, which runs

335 ounces silver, \$4 in gold, 4% copper and 60% lead. The tunnel is driven on the vein, which is nearly flat, and is now in 85 feet. The ore is being sacked at the chutes. C. S. McCarthy is superintendent.

The King-Tonopah Co. are erecting a 12 H. P. gasoline hoist, which will be used until the arrival of a 44 H. P. plant in about two months. The shaft is down 212 feet and will be sunk to the 600-foot level before crosscutting is commenced. H. J. Loughran is superintendent.

Tonopah, March 8.

Superintendent H. C. Jones of the Manhattan-Tonopah M. Co. at Butte, says he will sink a double-compartment shaft 500 feet.

The Home Run M. Co. has incorporated at Butte; S. P. Santos, T. Sullivan, H. H. Brown, F. J. Slebert and J. Travass directors.

Tonopah-Union Shaft No. 2, near Butte, is down 182 feet. Values in the ledge cut at the 155-foot level are reported to show \$150 per ton. The shaft is being operated by a whim, which will be replaced by a steam hoist. Shaft No. 2 will be sunk to 250 feet before crosscutting again.

The Commodore M. & D. Co. has been incorporated by Pittsburg, Pa., and California men, to develop a group of claims 14 miles north of the Central mines, on the mineral belt extending from Tonopah to Ray, along the northern base of Mount Ararat, near Butte. Their two-compartment shaft is down 50 feet and a steam hoist will be put up.

The directors of the Tonopah Cash Boy M. Co., J. D. Torreyson, president, have decided to install a hoist and other machinery at their mines near Butte.

The Tonopah Gold Belt M. Co. has been incorporated under the laws of South Dakota, to operate a group of five claims on the northwest slope of Gold mountain, near Butte. F. L. Talcott of San Francisco, Cal., is president, and F. Everett is manager.

The Lucky Tom M. Co., owning seven claims on Gold mountain, adjoining the Coleman group, near Butte, have begun development work, and will sink a double-compartment shaft.

The Tonopah-Belmont Water Co. has incorporated in Nevada for the purpose of piping water from the Combination springs, near Belmont, to Tonopah. The promoters say they will be able to supply 150,000 gallons of water per day and will be in position to furnish the water by June 1 next.

Six feet of quartz have been opened up in the crosscut from the shaft of the Hanapah G. M. & S. Co., 15 miles east of Butte, says Superintendent F. Work. Assays show an average of 220 ounces silver and \$6.50 gold.

STOREY COUNTY.

The 10-inch Davis calyx drill hole being put down from the surface in the east wall or Brunswick section of the Comstock at Virginia City for prospecting purposes is down 1000 feet. The hole is reduced to 5 inches and is in clay and porphyry with quartz boulders giving small assays.

C. Sharon, manager of the Equitable M. Co.'s ground, in Flowery district, near Virginia City, says 8 feet of free milling ore has been opened up, running \$30 per ton.

A station has been cut on the 1200 level of the Caledonia mine at Virginia City, and an air compressor will be installed. Electricity will be used, with a 30 H. P. motor to run the compressor. The Caledonia Co. made a shipment of thirty railroad cars of ore to the Brunswick mill this week.

WHITE PINE COUNTY.

The shaft at the Ruth mine, near Ely, is being enlarged and retimbered to the 300-foot level.

NEW MEXICO.

GRANT COUNTY.

The International M. Co. are operating their mines in the Malone district near Lordsburg. On the Gold Brick they have a horse whim in operation and are hoisting from an incline shaft 120 feet deep.

RIO ARriba COUNTY.

W. M. Woody, manager of the company operating a group of mines at Glenwood, 3 miles above Rinconada, on the Rio Grande river, says 1300 feet of flume have been built and it is expected the mill will be finished and in operation by May 1. Water power will be used. The plant is expected to save \$8 in gold per ton of ore handled. At present thirty-five men are at work. The same company owns a group of mines at Cieneguilla which contain ores showing gold, silver and copper, of average value of \$18 a ton. About 200 feet of tunnel and shaft work has been done and the ore will be smelted at Glenwood camp.

OREGON.

BAKER COUNTY.

At the Ross Gulch mine, near Sumpter, Superintendent D. D. McLeod has finished a crosscut on the 165 level showing the vein 18 feet wide of milling ore. This crosscut was made from the drifts being extended north of the shaft.

Work has begun on the Highland group of the Highland G. M. Co., says Superintendent M. L. Lohmire. It is intended to open the vein at greater depth by crosscutting on the Glasgow and Bannock Burn.

Manager Buckbee of the Virtue Con. M. Co., operating the Virtue mine, near Baker City, says he is sinking a new shaft to open the parallel vein, independently of the old Virtue working shaft.

The Combination G. M. Co. has been incorporated to operate the Combination group on Baldy mountain, 1½ miles south of Cable Cove, near Sumpter; A. Philbrick, S. R. Stott, J. C. Daves, A. P. Goss, C. H. Fenner, J. N. Hudson, F. M. Saxton.

The Listen Lake Co. has bought the Copper Butte claim, adjoining the Iron Dike, of the company's copper group, in McNamee gulch, near Sumpter, giving them a total of five claims.

President Thomsen of the Columbia Extension G. M. Co. says work will be resumed on the Ohio ground of that company.

A milling plant will be installed at the Emma mine, near Baker City, says Manager W. L. Vinson.

Yamhill men have bought the Summit Butterfly group, Cable Cove district, near Sumpter, says the Miner, and work has begun.

JOSEPHINE COUNTY.

W. E. Olmstead, manager of the Mountain View Copper Co., that recently bought the Scribner-Henderson mines near Wolf Creek, says he will install a 30-stamp mill.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Hidden Fortune mill, on White-wood creek, below Deadwood, is expected to be in operation by April 1. The mill is 4½ miles from the mine, involving a railroad haul of ore. The mill is a wet crushing cyanide plant, the ore being pulverized with stamps in a solution of cyanide of potassium. There are sixty stamps, each weighing 1050 pounds, and will run at ninety drops per minute. The mortars are of the double discharge type, the coarse crushing being done by a Blake crusher, from which the ore will be conveyed to the stamp batteries by a 24-inch belt conveyor. At the mine the triple-compartment shaft is down 150 feet below the floor of the Baltic tunnel. A station will be cut at 200 feet and a crosscut driven to the east on the Bingham vein. This vein is crosscut by several drifts from the Baltic tunnel. It is intended to double the size of the present mill and to build another plant, on a site yet to be selected, having 200 stamps.

TENNESSEE.

WAYNE COUNTY.

Near Waynesboro, Pittsburg men are reported to have bought 72,000 acres in the Southern iron belt, and an initial investment of \$5,000,000 is to be made in developing the properties. Furnaces will be built, rolling mills and other plants for finishing erected.

UTAH.

BEAVER COUNTY.

Manager B. Lloyd of the Copper Mountain M. Co. says they are putting up a 12 H. P. gasoline hoist at their mine on Copper mountain, near Milford.

The Wild Bill M. Co. are shipping a carload of ore per day from their two groups, the Wild Bill and the Burning Moscow, near Milford. This ore nets the company \$500 per car, after paying transportation and treatment charges. The railroad company has built a siding at Hay Springs, 5½ miles from the Burning Moscow, and another will be built at a point on the Frisco branch 5 miles from the Wild Bill.

Manager True of the Blackbird M. Co., near Frisco, says they have resumed operations and are sinking from the 240-foot level. A crosscut will be run to the ledge.

The Milford C. M. & S. Co. has incorporated; G. H. Dern, F. Y. Taylor, C. E. Hudson, H. Dinwoody, E. H. Alris, G. Romney and F. H. Lathrap. The property of the company consists of eleven claims near the O. K. mine of the Majestic Co., near Milford.

Manager Lane of the Success M. Co., near Milford, is preparing to sink a double-compartment shaft 300 feet. The work will be started on the 30-foot shaft, which will be enlarged, and at 200 feet a cross-

cut will be run to get under a 50-foot shaft which is in ore.

Superintendent P. M. McCree of the Blackbird mine in Copper gulch, near Milford, says he has men at work pumping out the shaft and getting ready to reopen the mine. The shaft, which is down 230 feet, will be continued and sinking also will be resumed on the shaft 1000 feet to the west. Later on power drills will be installed.

Manager B. Lloyd of the Copper Mountain Co., in Beaver Lake district, near Milford, says development work will be increased and a 12 H. P. gasoline hoist, with gallow-frame, shaft house, carpenter and blacksmith shops installed. The shaft, down 200 feet, will be sunk to 600 feet. From the 200-foot point an incline drift will be run 200 feet in copper ore.

BOX ELDER COUNTY.

P. W. Madsen, president and manager of the Century mine at Park valley, reports shipping last week a gold bar of \$3300 value, the product of a ten-day run at the plant.

EMERY COUNTY.

Work has resumed on the properties of the Hecker M. Co., near Woodside, says Manager H. Hardy.

IRON COUNTY.

The Johnny M. Co., at Stateline, are reported to have added the Bast mines to their holdings in that district.

JUAB COUNTY.

The first week since the introduction of the tribute system at the properties of the Bullion-Beck M. Co., near Eureka, closed with twenty leases in operation and forty men employed.

Several leases have been let on Humboldt ground by the Uncle Sam M. Co., near Eureka. The company is working the north end of the group and going ahead with plans for a concentrator.

The old workings of the Joe Bowers mine, at Silver City, are being put in repair by Superintendent G. Paxman. A hoist is being placed.

J. A. Beaman of Silver City has begun work on the Silver Queen.

Superintendent J. McChrystal of the Gemini mine of Tintic, near Eureka, says they are producing 1400 tons of shipping ore per month.

PIUTE COUNTY.

(Special Correspondence)—The Franklin G. M. Co., operating the Wedge property, have recently increased their capital stock to \$2,500,000 to complete the acquisition of additional territory in the Mount Baldy and Ohlo mining districts. A trial shipment of ore recently made on the Wedge by Superintendent H. L. Mills netted \$275. The carload was divided into two lots, one of which was first class and the other an average of the milling rock. The former gave returns of \$240 and the latter \$23 in gold.

The B. W. & H. in their crosscut have an ore body about 16 feet in width averaging \$20 per ton in gold. It is a network of ore streaks varying in size up to 6 inches in width, which averages \$20 gold and seventy-five ounces silver. Superintendent J. M. Billingsly is pushing the work toward the Jim Crow ledge, which on the surface gave an average of \$4 across 40 feet.

A deal is reported of the transfer of fifty mining claims, townsite and facilities for power, also reduction works near Marysville. Washington, D. C., and Pennsylvania men are the buyers. It shows the interest taken in this part of Utah, and in the Ohio and Mt. Baldy mining districts.

Articles of incorporation of the Henry Bradburn M. Co. have been filed. The company has been organized under the laws of West Virginia. They own ten claims on the north fork of Cottonwood.

A. Gore, superintendent of the Tribune group, reports that 200 feet will put the face into the large north vein, the croppings of which parallel the large porphyry dyke that runs through the Tip Top group.

It is reported that the Sevier Con., near Marysville, will be operated more extensively the coming season. Plans are being prepared for the remodeling and enlarging of the mill, and possibly the construction of a new one.

Marysville, March 8.

SALT LAKE COUNTY.

Superintendent Rookledge is taking out lead and silver ore at the Howland group at Alta.

The fifth furnace at the United States M. Co.'s smelter at Bingham was blown in on the 5th inst., says H. K. Masters, superintendent of the plant, increasing the capacity to 800 tons of ore daily.

Manager Jacobson of the Columbus Con. mine at Alta says last week they opened up a vein showing 8 feet of milling ore which averages \$10 per ton; 2 feet of the vein is smelting grade and assays \$40.

Shipments will begin next week. The proposed mill, in which the lower-grade product will be treated, will be erected this spring.

At the annual meeting of the Columbia C. M. Co., held last week, Secretary F. Cook stated that since Jan. 1 they have marketed from their Bingham mines crude ores and concentrates which yielded 148,000 pounds of copper, of which 75,000 pounds marketed during February sold for \$5900. Twenty-one men are on the payroll.

R. D. Evans and S. W. Winslow, trustees of the United States M. Co., have issued the following report to the stockholders:

Prior to January 1, 1903, only four carloads were shipped East from the smelter, containing 244,680 pounds of bullion, for refining, worth 29.2 cents per pound. Since January 1 twenty-one carloads, containing 1,276,440 pounds of bullion, worth 29.7 cents per pound, have been shipped. These values are based upon silver at 47 cents per ounce and copper at 11½ cents per pound. A contract has been made for the refining of all the product of the smelter, and all the bullion has been sold for a term of three years, the price per ounce of silver and per pound of copper or lead to depend upon the market price. The total amount expended since January 1, 1900, has been \$1,706,164.31, of which \$892,987.03 has been expended in construction and operation of the smelter and auxiliary works, and \$813,177.28 in buying new properties, in the development and equipment of the mines, in the payment of interest and general expense. The total amount received from the sale of bullion is \$382,500, and the amount still unpaid on bullion shipped is estimated at \$69,319.

SEVIER COUNTY.

At the B. W. & H. group, in the Henry district, near Marysville, they have finished crosscutting the 17-foot vein that was tapped by the tunnel while driving for the main lode. From this "blind" ledge eighty sacks of ore were shipped, yielding \$40 per ton in gold and silver. The upraise from No. 3 level has reached an elevation of 100 feet, the entire distance being in ore running \$60 per ton.

WASHINGTON COUNTY.

The Virgin Falls Oil Refining & Exploration Co. has incorporated at St. George; W. J. Riekell, J. T. Affleck, D. J. Smith, A. F. Gregerson. The company owns fifty-six placer claims near St. George.

WASHINGTON.

FERRY COUNTY.

J. W. McCann, lessee of the North San Pol mine, near Republic, says he is shipping ore to Nelson, B. C. The north drift on the 100-foot level is in 40 feet and the south drift 30 feet, both in shipping ore.

The Comstock LaFleur mine, near Republic, has been leased to McNeely and Pettit.

STEVENS COUNTY.

The Manora mine, near Bossburg, has a diamond drill in operation, prospecting below the 200-foot level. The Colville Co. is making preparations to determine, with a diamond drill, the extent of its ore bodies.

The United States Marble Co. is making shipments of green marble from its quarries near Valley to New York for decorative building uses.

The Miner says the Le Roi smelter at Northport, having arranged for a supply of coke, blew in two furnaces this week, and the other furnaces will be blown in as their coke supply increases. The company has 60,000 tons of ore piled up at the yards.

WYOMING.

LARAMIE COUNTY.

The Hecla C. & G. M. Co. of Denver, Colo., have bought the Louise and Victor copper and gold mines at Silver Crown, 20 miles north of Cheyenne, for \$15,000.

SWEETWATER COUNTY.

The Belgo-American drilling trust have begun drilling operations in the Salt Wells oil field, near Rocky Springs, and one rig is in operation. Twelve more rigs are being built, and they expect to erect at least twenty-five.

UINTA COUNTY.

It is reported that at Spring Valley last week miners working in No. 3 shaft at the Spring Valley coal mines opened up a fissure from which a stream of oil 2 inches in diameter flowed, accompanied by gas. Twenty-five barrels of oil were baled out of the shaft on the 4th inst., but the oil gained on them.

FOREIGN.

AFRICA.

TRANSVAAL.

The Cinderella Deep borehole has struck the conglomerate body of the

main reef at a depth of 3309 feet. At the bottom it is 16½ feet wide, 4 feet of which have given assays of 10 dwt. and 12½ dwt. The strike is of general interest, as it proves that payable gold reefs exist under the whole of the townships of Boksburg and Vogelfontein, which adjoin the northern boundary of the Cinderella Deep property. The mining rights under these townships belong to the Government and are included among the special assets which it is intended eventually to realize toward redeeming the Transvaal's contribution to the war debt. The townships are equal in area to 160 mining claims, and assuming they are only half the value of the claims belonging to the adjacent outcrop mines this asset alone would provide over a million and a half towards the reduction of the Transvaal's thirty million war loan. The strike is also important as affording further proof of the continuation of payable reefs into the deeper levels. The feature in this case is the great width of the reef. This, taken in conjunction with the results from the Turf Club borehole, goes to demonstrate the probability that the intervening area of 14 miles of deeper levels is auriferous.

AUSTRALASIA.

The production of gold in Australasia in 1902 was valued at \$81,020,324 (\$3,500,000 more than in 1901), according to a report to the Secretary of State from U. S. Consul-General Bray of Melbourne. Of this \$71,000,000 is credited to Australia and the balance to New Zealand.

BRITISH COLUMBIA.

It is reported at Nanaimo the Alexandra mines will be reopened. New bunkers will be built. The Wellington Colliery Co. is boring for coal a few miles north of Ladysmith. The demand for the product of the Island mines is such that thirteen vessels of all classes were at Ladysmith on the 1st inst. At Extension the output will be increased by the addition of a third shift. Two hundred men will be put on at the Protection mine. Work has been resumed at the Western Fuel Co.'s mines.

H. H. Claudet, manager of the Canadian Ore Concentration, Ltd., and the Le Roi No. 2 management, announce that an arrangement has been made for the erection of a 2-unit Elmore-process plant, to treat fifty tons daily of Le Roi No. 2 ore. The mill will be on the Annie and below all three dumps—the Annie, Josie and No. 1—to work by gravity, a fall of 50 feet being necessary.

Manager G. W. Stead says in drifting to intersect the surface showing on the Lucky Boy, near Trout Lake, when in 37 feet they cut a body of concentrating ore 3 feet thick, with a 10-inch vein of gray copper on one side showing some galena. The assay of an entire section of the vein shows 1000 ounces of silver.

At the Kootenay mine of the Rossland-Kootenay Co., near Rossland, stoping operations have begun on the third and fourth levels with two machines in each, and by the 18th inst. the crew will number at least fifty men, says Manager W. Thompson.

Owing to closing of furnaces at Trail smelter, forty of the fifty men at work at the Ilme quarry, near Cascade, have been laid off.

Manager Moyer of a Philadelphia company has an option on the Horseshoe mine on Trout creek, near Ferguson. The Horseshoe is in the same belt as the Ethel and Lucky Boy and adjoins the Grouse groups, which show gray copper and galena.

An electric plant has been installed at the Union Jack mine, near Ymir, says Superintendent Cameron. The Wilcox mine, near Ymir, has been temporarily closed down owing to the heavy snowfall which has stopped traffic.

The Payne mine, near Slocan City, is taking on more men, says Manager Garde.

The Fisher Malden, on Four-Mile near Slocan City, has shipped eleven cars of ore since the first of the year. Twenty men are employed.

The Blue Bird mine, 3 miles from Deer Park, has been unwatered, and stoping began this week. The mill will begin operations next week, says Manager J. E. Wardman. A compressor will be put in. The workings consist of an inclined shaft down 100 feet and horizontal workings extending to a point giving 200 feet vertical depth on the vein. The ore is silver-lead with some gold and copper and the vein 5 feet in width, with paystreaks on both walls. The whole body will average \$8 per ton, says Wardman.

At the Oyster-Criterion mine, near Lardau, machinery for the stamp mill is on the ground. A compressor will be put in and an aerial tramway installed this spring.

The Estella mine on Tracy creek, near Fort Steele, has closed down pending the building of the railroad to that section, says Superintendent C. H. Pollen. The

main tunnel on the Estella is in on the ledge 1200 feet, showing in crosscuts a width of 12 feet of concentrating ore and 3 feet of galena. As the Estella is 10 miles northeast of Fort Steele and 16 miles from the nearest railroad, Mr. Polien says his company has secured control of the Kootenay Central railway charter, with the intention of building a branch road to get their ore out. It is a low-grade silver-lead proposition and carries zinc ore. A mill-site on Tracy creek has been bought and a concentrator will be built this year.

J. Nelson has men at work on the Copper Crown group of copper claims near the Canadian Pacific railway at Isidore canyon, near Fort Steele. It is intended to drive a tunnel to get 100 feet depth on the ledge below the old shaft, which was abandoned because of water.

At the White Bear mine near Roseland the drift started from the 900-foot station broke into a body of copper ore last week. A five-ton shipment to the smelter showed 12% copper, says Manager B. Macdonald.

Returns from the Ymir mine at Ymir for January show during the month 4200 tons of ore crushed with sixty stamps running twenty-nine days, yielding 1711 ounces of bullion—gross estimated value, £4072. There were 265 tons of concentrates shipped, at a gross value of £1804. The cyanide plant treated 2350 tons; gross estimated value, £825. Total working expenses for month, £3350. Expenditure on capital account (cost of development), £515; sundry receipts, £165, with net profits of £2380.

The Atlin G. M. Co. has been incorporated to take over the Atlin, Nome No. 2 and Nome Fraction mineral claims, on Dundee mountain, 1½ miles from Ymir and adjoining the Dundee mine.

J. Dunsmuir, president of the Wellington Colliery Co., has ordered the Extension mines, near Nanaimo, to be shut down. It is said this is the mode the company has taken to answer its employees when they signified a desire to join the Western Federation of Miners. About 1000 miners are affected.

MEXICO.

CHIHUAHUA.

A strike has been made in the Cinco de Abril mine, near Acampo, of a 14-inch paystreak that assays 400 ounces silver and 40 ounces gold, says Superintendent S. Dedrick. Outside of this the vein is 13 feet wide and the ore shoot runs 12 feet per ton. On the Sierra Boluda mine, Dedrick reports 400 feet of drifting done on the 50-foot level and 225 feet on the 110-foot level—all on a vein 20 feet wide with a pay shoot sampling \$11 in both drifts. This mine is owned by the Camrose Syndicate, Ltd., H. Nathan, general manager.

Near Ojo Caliente, Broz & Daley of Ahumada have bonded for \$45,000 in gold the Grito de Dolores, Yndependencia, Constitucion and Oriente mines. They carry silver, lead and gold.

Manager J. S. Eldridge reports striking a shoot of 300-ounce silver ore in the La Fortuna mine, in the San Joaquin mountains, 21 miles from Nueva Casas Grandes. The strike was made at 300 feet in the shaft. The vein is 22 feet wide and averages thirty ounces.

Palmer & Berg are shipping 200-ounce silver ore from the Lincoln mine, in the San Joaquin mountains, 21 miles from Nueva Casas Grandes.

An English company, known as the Cherokee-Mexican Proprietary, Ltd., is operating a gold group near San Julian.

DURANGO.

The Guggenheim Exploration Co. has an option on the Caballo mine of W. S. Benton at Inde.

The smelting plant at Torreon is to be enlarged.

NEUEA LEON.

The Torreon Enterprise says an American company is working the salt mines at Sabinas, and has recently put in \$70,000 worth of machinery and is sinking a shaft 325 feet deep.

SONORA.

(Special Correspondence).—The Venice Copper Co., on the Yaqui river, 75 miles east of Minas Prietas, is operating the Magnolia and La Brisa. They have 3000 feet of work done on the La Brisa. The ore runs forty ounces in silver, \$10 in gold and 26% copper. They have a 60-ton smelter on the ground ready for erection, and expect to have same in operation in ninety days.

The Missouri & Mexico M. Co. are starting operations on their property in the Yaqui River district, 10 miles north-east of Suque Batuca. The ore runs 10% copper and high in silver and some gold. Surface showing is good, all ledges being very large.

Soyopa, Sonora, March 3.

(Special Correspondence).—Unless negotiations now pending terminate favorably, the Grand Central mine will close down

and probably be moved elsewhere. During the past three years the cyanide plant of C. Butters & Co. has treated 300,000 tons of tailings from the Grand Central and are about through. They are now endeavoring to make a contract with the Grand Central to treat low-grade ores from the mine. The Butters Co. is considering the erection of a plant at Copala, Sonora. F. M. Perry is manager and superintendent of the cyanide plant at La Colorada.

The 30-stamp mill of the Crestone Colorado Co. is handling 200 tons of ore per day. They are using eight Huntington mills in connection with the stamps, which gives them the large output. They do the coarse crushing in the batteries, finishing in the Huntingtons. Vanners are used for concentration. At the mine they have a 60 drill compressor and large hoist. The shaft is down 1100 feet. They have also a machine shop and foundry. Ore is transported from the mine to the mill by tramway; 350 men are employed, including a large number of Yaqui Indians.

La Colorada, March 6.

(Special Correspondence).—The San Fernando mine, 4 miles from La Colorada, has just commenced development. The assays show copper, gold and silver; H. C. Dougherty, manager.

La Colorada, March 6.

The Herald says the output of the Cananea smelters is eighty tons of copper daily.

A shaft is being sunk on the Pollock mine, near Douglas, Ariz. The property is near the wagon road and ore can be brought to Douglas at low cost.—Work will begin next week on the Fourth of July group, owned by the Atlas E. & M. Co. This company has three groups in this district. Assays from an 18-foot shaft, says the Miner, show \$30 gold, 200 ounces silver, 15% lead and 1% copper.—The Pavo Rico continues to ship ore and a new shoot has been struck in Tunnel No. 2, the ore assaying \$10 gold, with values in silver, copper and lead.

The Yaqui S. & R. Co. of Hermosillo, which is composed of Toledo, O., men, is about to let a contract for a considerable amount of machinery, including a 100-ton smelter, to be erected at San Antonio de la Huerta.

Last week the San Blas mine at Colorada, in Altar district, was sold to an Eastern company, J. A. Singley of Caborca manager, for \$5000. Development work will begin this month.

M. Gavito, B. Dubuch, G. Milhe, F. Glinder, J. Burrell and J. Urrere have organized the La Raja G. M. Co. at Naco. They have denounced ten pertenencias in the La Mestenas mountains, 28 miles from Naco. Development work will begin this month.

The Las Tajas M. Co. has incorporated at Tucson, Ariz., to operate the Las Tajas copper mine, near Zubiate; K. L. Hart, B. L. Worthen, T. J. Turner, L. F. Swain, P. E. Murry and H. Kains. They have a ledge 100 feet in width showing values in copper, gold and silver. A tunnel to cut the ledge at depth is being run, and is in 160 feet.

The Nogales C. Co., of Nogales, Ariz., has bought the Cerro Prieto gold mines, near Magdalena, for \$700,000.

The Cerro Escalado G. M. Co., near Nacozari, expects to put up a 10 stamp mill this spring.

NEW SOUTH WALES.

J. D. Kendall has examined the Cobar copper mine for the Amalgamated Copper Co. of America. English investors have neglected Australian copper and tin mines, and a number of Americans, seeing the opportunities, are planning large schemes. For several years past they have contracted for the purchase of the output of copper and tin from some of the leading mines in New South Wales, and they now propose to purchase the mines outright.

Successful experiments continue to be made at Broken Hill with the Delprat ore concentration process. In the first process the sulphide ores, including the products and waste from other metallurgical processes, are finely pulverized and divided. They are then immersed in a bath and the sulphides rising to the top are skimmed off or otherwise removed. No special plant or machinery is necessary for the immersion process. The powdered ore being fed into an inclined launder makes its way by gravity to an ordinary steam-jacketed pan or vessel, or into one set above an ordinary furnace. The ore then drops slowly into the bath. The bath consists of a solution of salt cake in water, of a specific gravity approximating to 1.410. The solution is kept hot, but preferably not allowed to boil. As an alternative the hot bath consists of a solution of sodium sulphate in water, to which is added free sulphuric acid, so that the resultant will approximate 1.410. As the ore immerses itself in the heated bath, the sulphides disengage themselves from the gangue, rising to the top, whence they

may flow away or be skimmed off. The second process consists in the ores being dropped into a heated bath of nitrate of sodium, nitrate of potassium or nitrate of zinc, dissolved in water, to which is added dilute nitric acid, so that the result will have a specific gravity of 1.410, though a little lighter or heavier does not matter. The sulphides in this process also rise to the top, and then flow away, or may be otherwise removed.

SWEDEN.

The Slangell copper mines, near the boundary between Norway and Sweden, are reported sold to an American company for \$1,000,000.

TASMANIA.

The Mount Lyell mine continues its output of 1000 tons of ore a day. The manager has been examining the mines in the Rosebery district, 50 miles distant by rail from Queenstown, where there are said to be some promising low-grade properties. In the quarterly returns to September 30th the North Lyell output is given at 8420 tons, the ore averaging over 10%. The deeper workings have recently exposed some rich ore.

PERSONAL.

H. G. MCKINNEY of Kansas City is now in Sonora, Mexico.

A. E. KLAUSER, Toledo, Ohio, is at Hermosillo, Sonora, Mexico.

G. KARTSCHAKE is in San Francisco, Cal., from Nevada City, Cal.

W. L. MARKS is manager of the Bertha mine, near Idaho Springs, Colo.

W. J. ROBINSON, a miner from Atlin, B. C., is in San Francisco, Cal.

T. W. FOSTER has returned to Batuca, Sonora, Mexico, from Kansas City.

W. R. BEALL, a mining man of Redding, Cal., is in San Francisco, Cal.

JESSE J. SCOBEE is in San Francisco en route from Arizona to Denver, Colo.

M. L. LOHMEIE is superintendent of Highland G. M. Co., near Sumpter, Or.

J. BRESNAHAN is superintendent of the Republic Con. M. Co. at Republic, Wash.

G. E. NORTHEY, a quicksilver miner of Sulphur Creek, Cal., is in San Francisco, Cal.

F. LEONARD of Salt Lake City, Utah, is in Kansas City, Mo., on mining business.

E. F. PAGE has returned to Colorado Springs, Colo., from La Dura, Sonora, Mexico.

A. M. WOMBLE of San Francisco, Cal., is examining mining properties at Tucson, Ariz.

G. H. BARNHARDT has resigned as superintendent of the Ymir mines at Ymir, B. C.

M. C. GARDNER, JR., E. M., of Carson, Nev., is at Tonopah sampling the Mizpah dumps.

D. MCVIEHIE of Salt Lake City, Utah, manager of the Bingham Con. M. Co., is in Boston, Mass.

T. B. SCOTT, owner of the Lucky Boy mine, near Chloride, Ariz., is at Chloride from Chicago, Ill.

W. F. SNYDER, of Salt Lake City, Utah, manager the Bingham Con. M. Co., is in Boston, Mass.

J. B. LAUGHLIN of Pittsburg, Pa., part owner Lucky Boy mine, near Weiser, Idaho, is at Weiser.

W. C. URBAN, general manager Venice Copper Co., has returned to Venice, Ill., from Sonora, Mexico.

R. W. RODDA has resigned as mine superintendent of the Horseshoe M. Co., near Deadwood, S. D.

B. C. COOK is superintendent of the cyanide mill of the Penobscot M. Co., near Deadwood, S. D.

F. C. COOLEY, representing the Baker & Adamson Chemical Co. of Easton, Pa., is in San Francisco, Cal.

E. J. BONSTELL, of Sutter Creek, is now mill foreman of the Mount Jefferson mill at Groveland, Cal.

F. EARLS has returned to Salt Lake City, Utah, from an examination of mining property at Pioche, Nev.

W. G. BRILL, a Nome, Alaska, miner, has returned to his home at Mount Bullion, Mariposa county, Cal.

W. J. LAWRENCE, manager of the

Scottish Chief mine at Park City, Utah, is in New York on business.

H. C. JONES of New York, vice-president and superintendent Manhattan-Tonopah M. Co., is in Butler, Nev.

J. LANGFORD has resigned as superintendent Sheep Ranch mine, at Sheep Ranch, Calaveras county, Cal.

W. THOMPSON, general manager Roseland-Kootenay Co., has returned to Roseland, B. C., from London, Eng.

J. MCCHRISTAL, superintendent of the Gemini M. Co. at Eureka, Utah, is in Salt Lake City, Utah, on business.

G. B. HALLORAN, superintendent Woodenhoft properties on Smith creek, near Thunder, Idaho, is at the mines.

R. ANDERSON, superintendent British Columbia mine, Greenwood, B. C., has returned from a trip to Vancouver, B. C.

R. J. GROSS, vice-president America Locomotive Co., sailed from San Francisco for Siam on the Sierra on the 10th inst.

GENERAL MANAGER W. A. FARRISH of the Majestic Copper Co. has returned to Salt Lake City, Utah, from Arizona.

MANAGER E. T. HOLLIDAY of the Frontier Exploration Co. is at the mines near Cerbat, Ariz., from Redlands, Cal.

W. T. STEPHENS, superintendent Pinon Blanco mines, near Coulterville, Cal., is in San Francisco, Cal., on business.

MANAGER J. DOPP of the New York-Tonopah M. Co. returned last week to Butler, Nev., after an extended trip East.

E. & L. POAGE have gone from Grass Valley, Cal., to Chemulpo, Korea, to build a dam and flume for the Oriental Con. M. Co.

W. L. LANDUS has been elected recorder and C. L. Richards secretary of the Tonopah mining district at Butler, Nev.

J. FARREN, superintendent of the Glasgow & Western Exploration Co.'s mines at Golconda, Nev., is in Salt Lake City, Utah.

J. M. DIKEMAN, of Lawton, Oregon, left last week for Rhodesia, South Africa, where he takes charge for a London company.

R. E. OBER, superintendent Beatrice-Robles mines, near Murphys, Calaveras county, Cal., has returned from a business trip East.

A. W. MCCUNE, manager Cerro de Pasco mines, Peru, South America, has returned to Cerro de Pasco from Salt Lake City, Utah.

P. CLARK, president of the Republic Con. M. Co., has returned to Spokane, Wash., from a trip to their mines at Republic, Wash.

J. W. MCCANN, lessee of the North San Poil mine, near Republic, Wash., has returned to Republic from a business trip to Nelson, B. C.

J. A. CZIZEK, manager of the Lost Packer mine on Loon creek, near Custer, Idaho, is visiting the mine from Salt Lake City, Utah.

J. E. BEVERIDGE is superintendent of the Dixie mines of the Utah & Eastern M. Co., near St. George, Utah, vice G. Snyder, resigned.

J. M. THOMAS, manager Fremont-Vineta Oil & G. M. Co., has returned to Breckenridge, Colo., from a directors' meeting in Chicago, Ill.

B. BENTON, of Bay City, Mich., who has large interests in the cement works at Tolinas Springs, Solano county, Cal., is in San Francisco, Cal.

DANA HARMON, E. M., has returned to San Francisco, Cal., from an extended tour of the mines in the Rocky Mountain region, recently in Colorado.

THEO. F. VAN WAGENEN, of Sallisbury, Rhodesia, S. A., is conducting a mine-exploration trip through Transvaal, Natal and Cape Colony, S. A.

R. H. TERHUNE, manager of the Iron Dyke M. Co., in Seven Devils district, Idaho, returned last week to Denver, Colo., from Baker City, Or.

J. T. PENDEGAST and G. N. MCCOLLOUGH, vice-president Prescott-Arizona G. M. Co., Prescott, Ariz., are in the East on business for the company.

C. E. ANDERSON, engineer for Taylor & Brunton of Denver, Colo., has been in Sonora, Mexico, looking after mining interests, and is now at Cananea.

SECRETARY L. G. LILLEY of the Baby McKee G. M. Co. of Cincinnati, O., is superintending operations at their Last Chance mine, near Sumpter, Or.

A. CASE, formerly superintendent of the Cornucopia mines of Oregon, manager

of the Canadian Lead Co. of Montreal, is in London, Eng., on mining business.

F. DAVIS, formerly metallurgist at Rawhide and App mines, Tuolumne county, Cal., is now manager Yaqui S. & R. Co. at San Antonio De La Huerta, Sonora, Mexico.

P. S. DAVIS of Gatton, Australia, who has been near San Marcial, Sonora, Mexico, the past three months, is now in New York. Mr. Davis represents the Davis Calyx Drill Co.

G. SNYDER has resigned as superintendent of the Dixie mines of the Utah & Eastern M. Co., near St. George, Utah, and has accepted the position of assistant manager of the Western Exploration Co.

E. H. LITTLE, formerly manager of the Colorado River G. & C. Co. and of the Papago M. Co., has been appointed fiscal agent of the Friday Guich G. M. Co., whose mines are at Havilah, Kern county, Cal.

CHAS. B. GIBSON has returned to Chicago from an extensive trip through Sonora and Sinaloa, Mexico, after having examined and reported on six gold, silver and copper mines for the International Copper & Gold Co. of Chicago.

W. B. FISHER, general manager of the American Zinc, Lead & Smelting Co., of Carthage, Mo., has resigned and has gone to Colorado Springs, Colo., where he will reside during the summer. Mr. Fisher has had the management of the American Co.'s properties for the past four years.

Recent Geological Survey Publications.

One of the most interesting and useful topographic maps published by the United States Geological Survey is the Cœur d'Alene special map now in press and will shortly be issued. The map is drawn on a scale of approximately 1 inch to the mile, and represents with great accuracy the topographic features of the Cœur d'Alene mining region in Idaho. On it are shown the locations of Bunker Hill and Sullivan mines and the Last Chance mine at Wardner; also the Hecla, Standard and Wardner mines at Burke, the Gem and Helena Frisco mines at Gem, and the mining interests located near Mullan. In addition to these larger mines the locations of all of the smaller prospects throughout the region are indicated, as well as the placer prospects in the Prichard creek region, a few miles farther north.

There is also a topographic map of the Santa Susana quadrangle, embracing portions of Los Angeles and Ventura counties, Cal. On it will appear parts of the Pine mountains and Zaca lake forest reserve, the Santa Susana mountains, and the northern side of San Fernando valley. It will show the region near the headwaters of the Santa Clara river and that portion of the Santa Susana mountains whose drainage is to be utilized for the municipal supply of Los Angeles.

The topographic map of the Dahlonega quadrangle in Georgia, covering all of White and Towns counties, and portions of Union, Lumpkin, Habersham and Rabun counties is also in press. The region is of special interest, as it includes the Dahlonega section, one of the earliest and most valuable gold mining regions of the East. Here was located a United States mint, which remained in operation until 1861. Gold was first taken from the Chestatee river gravels and other deposits of the region by placer mining, and dredging the river bottom for gold is still practiced. Of late years deep mining has been resorted to in the surrounding hills, and large stamp mills and chlorination plants have been erected at Dahlonega.

The sheet also shows the region in which is the rich deposit of pyrite that was recently opened to supply material for the manufacture of sulphuric acid.

Obituary.

D. F. RHEINHARDT of Dillon, Mont., for several years superintendent of the Hecla Con. M. Co., at Hecla, and until recently manager of mining properties in Mexico, died at Dillon on the 4th inst. from a stroke of apoplexy. Deceased was born in Wurtlenburg, Germany, in 1845, coming to America in 1862. He leaves a wife and two daughters.

Books Received.

"Statics, hy Algebraic and Graphic Methods," is the title of a new work by Lewis J. Johnson, C. E. The book is intended for the use of students of engineering architecture. It deals with the solu-

tion of statical problems, stress in structures of various kinds, both framed and unframed. Both graphic and algebraic methods are employed in demonstration. The book is complete and profusely illustrated with graphic diagrams; 133 + VIII pages; 42 figures and 6 double plates; cloth, \$2. John Wiley & Co., New York and London.

Commercial Paragraphs.

THE Pelton Water Wheel Co. of San Francisco have the exclusive sale on the Pacific coast of the New American turbine wheel made by the Dayton Globe Iron Works, Dayton, O.

H. V. CROLL, manager Salt Lake City branch Allis-Chalmers Co., writes that after March 20 the Salt Lake City branch office will be located at 209-211 South West Temple street.

THE Mine and Smelter Supply Co. of Denver, Colo., has recently put two Dimick classifiers in the mill of the Ophir Con. M. Co. at Ophir, Colo., one in the mill of the Empire Zinc Co. at Canon City, Colo., and one in the mill of the Resurrection G. M. Co. at Leadville, Colo.

At a special meeting of the stockholders of the Brown Corliss Engine Co., in Corliss, Wis., Feb. 26, 1903, there were 7910.1 of all the outstanding votes cast either in person or duly authorized proxy, in favor of increasing the capitalization of the company from \$1,000,000 to \$1,200,000.

JOHN A. YEATMAN & Co. of San Francisco, Cal., hydraulic engineers and contractors, have opened up offices at No. 13 First street. They report shipping one Adams hydraulic lift to Ecuador, S. A., this week, and are preparing seven more for shipment to Alaska. They have also shipped a brass pump to the International Salt Co. for pumping brine.

THE Krogh Manufacturing Co. of San Francisco, Cal., report shipping to Texas for rice irrigation four of their "special California centrifugal" pumps, with capacities ranging from 30,000 to 35,000 gallons per minute, the orders being obtained in competition on guaranteed efficiency tests. They also have one of their cement gravel mining machines ready for shipment to the Feather River district, Cal.

THE Arizona & Sonora Manufacturing Co., Nogales, Arizona, employs between 75 and 100 men. They have a machine shop 50x90 feet, well equipped with the latest style and improved machines. The foundry is 50x90 feet, the pattern and forge shops each 50x50 feet. They are contemplating the erection of a large shop for the machine department. At present they are building a compound engine, 12x22x30, for the local electric light plant and have completed a 20-stamp mill for the Yerkes G. M. & M. Co. of Sonora, and have a large number of orders for ore cars and mining cages. E. Titcomb president, Charles Mix treasurer, W. E. Carroll superintendent. Roy & Titcomb are sales agents for the above company.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MARCH 3, 1903.

721,556	—NOZZLE—J. Bean, Los Gatos, Cal.
721,556	—REPAIR CAR—G. L. Bender, S. F.
721,557	—LUMBER REGISTER—W. G. Boswell, Sola-dag, Cal.
721,580	—WOOD SAWING MACHINE—T. M. Danagan, Noble, Or.
721,799	—FRICTION CLUTCH—M. G. Harris, S. F.
722,015	—BOTTLE—C. Hatley, Rialto, Cal.
722,103	—NEEDLE-AWL—B. E. Hevey, Ritzville, Wash.
722,034	—SWITCH—J. N. Ke'nan, Colgate, Cal.
721,725	—CONVEYOR—W. L. McCabe, Seattle, Wash.
721,819	—DOOR HANGER—J. F. Millerick, S. F.
721,820	—TRUCK—J. J. Moule, San Jose, Cal.
721,967	—ROOFING TILES—E. L. Quinn, Los Angeles, Cal.
721,747	—BUILDINGS—J. Roemer, Santa Maria, Cal.
721,969	—LEDGER—C. A. Schofield, Los Angeles, Cal.
722,155	—OIL BURNER—H. L. Sherwood, Oakland, Cal.
721,754	—REIN HOLDER—B. A. Smith, Tacoma, Wash.
722,156	—BEET TOPPER—C. Spreckels, S. F.
722,162	—SASH FASTENER—F. X. St. Louis, Colusa, Cal.
721,932	—PLANING FLOORS—Stephens & Goodale, Pasadena, Cal.
722,163	—OIL BURNER—W. J. Stoermer, Los Angeles, Cal.
721,759	—BOTTLE—H. Van Wie, S. F.
722,170	—BOTTLE AND BRUSH—Weher & Frey, Baker City, Or.
722,068	—STATION INDICATOR—P. J. Wilson, Ben Lomond, Cal.
721,850	—MEASURE—A. C. Wright, Berkeley, Cal.
721,990	—NUT LOCK—W. R. & G. W. Young, Stockton, Cal.

Latest Market Reports.

SAN FRANCISCO, March 13, 1903.

METALS.

SILVER.—Per oz., Troy: London, 22s 10d (standard ounce, 925 fine); New York, bar silver, 49½¢, refined (1000 fine); San Francisco, 48½¢; Mexican dollars, 38 @39¢ San Francisco, 38½¢ New York.

COPPER.—New York: Standard, \$14.00; Lake, 1 to 3 casks, \$14.50@15.00; Electrolytic, 1 to 3 casks, \$14.50@15.00; Casting, 1 to 3 casks, \$14.50 @15.00; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @24¢. London: £64 5s spot per ton.

Concerning the present copper situation, a prominent Eastern authority is quoted as saying: "The present conditions are in no sense the outgrowth of manipulative tactics, but are purely the result of a steady-growing legitimate demand for the metal—a demand which I believe will reach unprecedented proportions. Neither the Amalgamated people nor any other interest are opposed to the present movement. Indeed there was, as everybody understands, a long period during which the metal situation appeared to be under a heavy hand; but that hand has now been removed and the market ought, as I believe, to go on expanding with the consumption steadily increasing until it shall have caught up with the extension that has characterized other lines of trade and industries during the past two or three years."

LEAD.—New York, \$4.37½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½¢ 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½¢; pig, \$4.75. London: £13 12s 6d per long ton = 2.75¢ per lb.

SPELTER.—New York, \$5.25; St. Louis, \$4.60; London, £23 0s per ton; San Francisco, ton lots, 6½¢; 100-lb lots, 7¢.

ANTIMONY.—New York, Cookson's, 9½¢; Hallett's, 8½¢; San Francisco, 1000-lb. lots, 10¢; 300 to 500 lbs., 11¢; 100-lb. lots, 13¢@15¢.

TIN.—New York, pig, \$30.55@30.75; San Francisco, ton lots, 32¢; 500 lbs., 32¢; 200 lbs., 32½¢; less, 33¢; bar tin, \$ ½, 35¢ @37½¢. London, £139 15s spot.

PLATINUM.—San Francisco, crude, \$18.00 @ ½ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80¢ per gram.

QUICKSILVER.—New York, \$45.50@46.00; large lots; London, £8 15s; San Francisco, local, \$45.00 @ ½ flask of 7½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10¢; No. 2, 7¢; No. 3, 6½¢; extra, 17½¢; genuine, 35¢; Eclipse, 37½¢.

ALUMINUM.—New York, No. 1, 99¢ pure ingots, 35¢; No. 2, 90¢, 30¢ to 34¢.

SOLDER.—Half-and-half, 100-lb. lots, 20¢; San Francisco, Plumbers', 100-lb. lots, 16.65¢.

NICKEL.—New York, 50@60¢ @ ½ lb.; ton lots, 45@48¢.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.10; gray forge, \$20.50; San Francisco, bar, 3¢ @ ½ lb., 3½¢ in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7¢ to 12¢ per lb.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; lath, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILES.—Per keg (list prices): No. 20d to 60d, Wire, \$3.35; Cut, \$3.35; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for car-load lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15¢; less than one ton, 17½¢. No. 1*, 60%, carload lots, 13½¢; less than one ton, 15¢. No. 1** 50%, carload lots, 11½¢; less than one ton, 13½¢. No. 2, 40%, carload lots, 10¢; less than one ton, 12¢. No. 2*, 35%, carload lots, 9½¢; less than one ton, 11½¢. No. 2** 30% carload lots, 9¢; less than one ton, 11¢. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½¢ @ set; 14 oz., 40s., 9½¢.

CEMENT.—Germania, \$2.50 @ 2 75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50@2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50; Brymho, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 56¢; cs., 61¢; raw, bbl., 54¢; cs., 59¢; Lucol oil, hoiled, bbl., 50¢; cs., 55¢; raw, hbl., 48¢; cs., 53¢. Kerosene—Pearl, per gal., 22½¢; Astral, 22½¢; Star, 22½¢; Extra Star, 25½¢; Ecocene, 24¢; Elaine, 27½¢; Water White, in bulk, 16¢; Mineral Seal, iron bbls., 18½¢; wooden bbls., 21¢; cs., 24¢; Mineral Sperm, cs., 26½¢; Deodorized Stove Gasoline, bulk, 17¢; do., cs., 23½¢; 86° Gasoline, bulk, 21¢; do., cs., 27½¢; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16¢; do., in cs., 22½¢; c. Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75¢; cs., 80¢; Sperm, crude, 50¢@60¢; Natural White, 65¢; Bleached do, 70¢; Whale Oil, cs., 50¢@55¢.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½¢; less than 500 lbs., per lb., 6½¢; in 25-lb. tin pails, 4¢ per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 4¢ per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6¢; do. in kegs, 6½¢.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6¢; less than 500 lbs., 6½¢.

LITHARGE.—Pure, in 25-lb. bags, 8 @9¢ per lb.

BONE ASH.—Extra No. 1, 5@6¢ per lb. No. 1, 4@5¢.

BORAX.—Concentrated, 7@9¢ per lb. powdered, 9@12¢; fused, 25@30¢.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4¢ @ ½ lb.

BORAX.—Crystal, 7¢; calcined, 25¢.

COPPER.—Sulphate, 5@7¢.

MANGANESE.—(90% and over) @ ½ lb., \$1.25.

MOLYBDENUM.—25¢ @ ½ gramme; 1000 grammes=2½ lbs.

CHROMIUM.—(90% and over) per lb., \$1.25.

SODIUM.—Metal, @ ½ lb., \$1.25.

MERCURY.—Bichloride, @ ½ lb., 90¢.

PHOSPHORUS.—(American) @ ½ lb., \$1.00.

SILVER.—Chloride, @ ½ oz., 90¢@1.00; nitrate, 55¢.

URANIUM.—Oxide, @ ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, @ ½ lb., 50¢; dust, @ ½ lb., 10¢; sulphate, @ ½ lb., .04¢.

(These prices are wholesale, f. o. h. San Francisco, unless otherwise noted.)

A PRACTICING PHYSICIAN AND SURGEON, in San Francisco, of excellent standing, desires a position as surgeon to a mine or mining company. Is a graduate of the University of California. Best of references given. Address Box 13, this office.

Life of Mine Timbers.

When timbers are placed in underground workings of mines the life of these timbers is somewhat speculative, and not always easy of determination. There are many things, aside from crushing and destruction by blasting, which have a direct influence on the life of timbers. Important among these are the amount of moisture in the atmosphere of the mine, together with the temperature, ventilation, etc. A hot, moisture-laden atmosphere rots pine timbers with a rapidity that is sometimes astonishing. If, however, the same timber is placed in a position where it is perpetually wet, not with the moisture of the atmosphere, but with running water, or entirely beneath the water, its life is greatly prolonged, and it may endure for years if not crushed by pressure.

The condition and kind of timber is itself important. Pine, spruce, etc., cut in the winter months, when the sap is down, will last very much longer than that cut in spring. In fact, sap-laden timbers are expensive at almost any cost, as a few months is all that may be counted on after being placed underground.

The butts of logs often give a fair index of the probable relative life of pine timbers. Those having narrow rings, and a firm solid appearance, will be found to far outlast those having wider rings with a soft, porous texture. Spruce timbers are usually more serviceable than either yellow or sugar pine. When placed in the same sets, where the conditions are practically uniform as affecting timbers, in a humid atmosphere, the pine timbers will quickly become covered with white fungi, and in a few months decay will have proceeded so far that only the heart of the timber will be serviceable, while spruce timbers, put in at the same time, are still in a good state of preservation, though spruce timbers will not stand as great a crushing load as pine, nor has it as great strength to resist cross fracture.

Oak timbers endure longer than any of the cone-bearing species of timbers, but owing to its high cost and the inability to obtain it at all in most places, oak is not used extensively in mining operations. It is more expensive to frame also. In California red-

wood has been employed extensively as mine timber at the New Almaden quick-silver mines, and has proven satisfactory there. The timbers are all sawed, usually of large size, and are often placed in the mine double, being bolted together. That is, two posts are employed where usually but one is found, etc. As redwood is cheaper than pine at this mine, and as the timber does not rot out, it seems well suited to use in mines having hard ground that stands fairly well without timber.

In Australia the eucalyptus has been extensively used in some districts, and is reported as being satisfactory. It is better in the form of round sticks than as sawed timber, owing to the "twist." No timber should be placed in mines without first removing the bark, and the timber should also be well seasoned. It has been observed in some of the hot, humid workings of mines in Amador county, California, that timbers placed directly in line with the current of air passing through a

Crown Mica Mine, Custer, S. D. (See page 181.)

stope were much more seriously affected by decay than similar timbers placed a few feet distant, but where the direct air current did not strike them.

The longevity of mine timbers is a subject given only passing attention by mine superintendents, as they are usually calculated to last only a comparatively short time; but the fact that timbers frequently require renewal, by reason of decay, suggests the necessity of either a more careful selection of timber or a change in methods of mining, which will place less dependence on the timbers for permanent support.

Though there are a number of preparations which answer admirably in preserving timbers, these are not in general use at mines for the same reasons as those already given, although it is not uncommon to treat timbers placed in sills and in the first few sets near the collars of shafts to prevent surface decay or dry rot.

The kind of timber selected by mine managers is ordinarily determined by the first cost—those obtainable at the lowest price which appear suitable as to size and condition are generally the ones bought and used in the mines, though it is questionable whether this is always in line with the strictest ultimate economy.

THE Oregon Legislature has passed a law fixing a license tax on new incorporations in that State, which will have a direct effect on new mining corporations. Under the provisions of this law, beside the original tax upon incorporating, there will be an annual tax. The amount of tax is determined by the capitalization. The probable effect of this law will be the limitation of capital stock in new mining corporations to much smaller amounts than is usually adopted.

Private vs. Corporate Management.

Not infrequently mines which were known to have paid a satisfactory profit under the ownership and management of private interests, upon passing to a corporation, cease to be dividend payers; and, again, similar instances are of record wherein mines operated at a loss under corporate management, after an idleness of several years, finally become private property, and enter upon a career of prosperity for the first time in their history. Naturally an explanation of the causes for this difference in private and corporate management is sought, and may usually be found.

Where this interesting example has occurred, upon investigation it will usually be found that under private ownership the management, if not scientific and technical, was, at least, thoroughly practical; and often, too, it will be observed that the operations were conducted on a less elaborate scale. If a 60-stamp mill were an attachment of the property under the corporate management, but five or ten stamps, or possibly twenty, were run under private ownership. Less ore was broken by the latter, but that from the pay streak or zone of better grade, and no attempt made to handle large quantities when every portion of the rock mined and milled did not pay at least the expense of mining and treatment. This is sacrificing a large output with more or less ostentatious display, to quiet, business-like management, and practical application of mining and business methods.

Then, too, under private ownership there are usually fewer officers, and salaries are often somewhat lower. There are no ornamental figureheads, who do nothing but draw their salary; no elaborate turn-outs, emblazoned with "coats of arms; plain, practical men and methods take the place of display and incompetency, and the saving thus effected represents the difference between success and failure. It may be said that in some cases where men are competent to handle a small property successfully, that they lack the technical knowledge and skill and business ability to successfully manage a large mine where the mining and metallurgical conditions re-

quired the highest engineering and technical experience. While this in some instances may be true, it is also true that a property of the latter class will usually, still less than a more ordinary property, justify the extravagance of incompetent management.

Large low-grade mines, to insure a profit, must have the most careful management, and the maintenance of two or more elaborate offices, with their large incidental expense, added to similar unnecessary expense at the mine, usually means failure, and this the private management dispenses with entirely. This principle also applies to the leasing system and offers an explanation of why leasers can sometimes make a mine pay which has proven a failure under corporate ownership and management.

Labor Troubles in Mines.

Industrial conditions in the United States are being disturbed by widespread conflict between capital and labor. In the mining industry particularly is this unsettled condition of affairs noticeable. In many mining States the miners are organized. It is not strange that mine owners and managers do not always promptly comply with the demands made by the unions. In some cases requests made by the miners just and reasonable are granted, and they have gained their point without a strike, or other demonstration; in other instances the demands are unbusinesslike and unreasonable, and have been met by prompt and flat refusal on the part of the management. In these instances a strike has generally resulted. A notable instance is that at the Golden Reward smelters at Deadwood, South Dakota, where several extra men were employed on extra work, which, having been completed, the men were paid off and discharged, there being nothing further for them to do. The union demanded their reinstatement, which was refused by the management, a strike resulting, followed by a shut down of some of the company's mines. A demand like that instanced is simply the outcome of ill-advised leadership.

Many of the troubles between mine owners and the labor organizations have been over recognition of the unions. They have demanded the discharge of non-union men, and when this has been complied with have in some cases refused admittance of the discharged men into the union, thus practically depriving them of an opportunity of making a living.

An instance of this is found in the trouble at Keswick, Cal., which has been going on for several months, practically paralyzing the mining industry of that part of California. In that district the citizens have taken sides with the Mountain Copper Co., thereby indicating their disapproval of the action of the union in this matter.

In some districts the boycott has been and is now employed in furtherance of the demands of the union laborers. In the Cripple Creek, Colo., district, may be found an instance of this phase of the labor trouble. The miners have required of mine owners that they shall not ship ore to the Colorado City reduction works, where the workmen have struck for higher wages and shorter hours. In this case the State militia has been called out. The unions claim a victory thus far in the matter, having secured the promise of a number of mine managers not to ship ore to the Colorado City mills. A number of mines have shut down in Cripple Creek district as a result of this difficulty, over 600 men being out of work in addition to those at the mills.

On March 18, in San Francisco, Cal., a large number of California mine owners and managers met to organize an association for the purpose of preventing, as far as possible, those constantly arising troubles between the miners and their employers, and for adjusting those difficulties when they do occur. This movement originated in the organization in Amador county, Cal., in 1901, of a local mine managers' association, with a similar purpose in view. At that time a miners' union was projected, being started ostensibly as a benevolent fraternal organization, but the real purpose of the organization was the unionizing of Amador county miners. Many years ago a miners' union was organized there, and a peaceful, prosperous district soon after became a scene of riot and bloodshed, which was finally quelled by troops. The present operators, having this incident in mind, and not caring for a repetition of similar scenes, organized for self-protection, and

the unionizing of Amador county apparently came to a standstill; but more recently members of the Western Federation of Miners have been in that section and have succeeded in forming a union. At Hayden Hill, in northern California, within a fortnight, a union has been organized by the same Federation.

In California, where mining has been actively carried on for over fifty years, the rich superficial portion of the veins and the placers have mostly been long since exhausted, and mining in that State is now carried on at great initial outlay and constant heavy expense, with returns not more than satisfactory, and, in some cases, at a loss, and, in some cases, it has become rather a matter of existence than of large profits in mining. In view of mutually existing conditions between operators and employes, which for years past seem to have been satisfactory, and the knowledge that any material increase in expense will prove a hardship which the mines will generally be unable to meet, the California mine owners have decided to seek protection by organization.

In British Columbia, for some months past, a number of the most important coal mines have been closed by miners striking for increased pay and shorter hours. At Nanaimo the management of the Wellington mines have closed some of their properties upon learning of a desire upon the part of their men to join the Western Federation of Miners. Over 1000 men are there affected.

The industrial discontent that is making itself so universally felt affects the general public as well as the employers, employes and special interests of the industry affected. The natural law of the business world assumes such complex relations that a strike in the coal mines of British Columbia affects London and the Argentine Confederation; a "walk out" in a Colorado gold mill has far-reaching consequences in Eastern railway movements; a shut down in a California mine upsets a project of South African investment; a tie up in an Idaho mining camp determines the fate of a proposition in Ecuador. While true of all enterprises, this is particularly manifest in anything affecting the great basic industry of mining, which is the corner stone of national prosperity, and hence anything that affects the continuous operation of mining anywhere has instant hearing on all projects that depend for their progress thereon.

In Aid of Mining.

The California Legislature, during the session just closed, made two appropriations in the interest of mining, one of which is that of \$56,000 for the maintenance of the State Mining Bureau for the ensuing two years. This appropriation is smaller than any that has been made for several years past, and is not commensurate with the importance of the mining industry in that State. The appropriation is divided into four sections, viz: \$6000 salary of State mineralogist, \$10,000 geological and other field work, \$40,000 to maintain the office and museum in San Francisco and \$10,000 for printing the publications of the bureau. A bill was also passed authorizing the sale of the bureau reports at cost of printing, which will increase the available funds about \$100 per month, or \$2400 during the two years' term, which may, in the discretion of the trustees, be applied to the geological fund.

As the field assistants usually receive \$150 per month and expenses in the field, the funds available will not admit of more than two field men being employed continuously, with the occasional employment of one or two others. In consideration of the large field to be covered, the fund available for the purpose seems very small.

The other appropriation referred to is that of \$130,000 for the purpose of making a State exhibit at the Louisiana Purchase Exposition at St. Louis, Mo., and of this, \$25,000, it is understood, is to be devoted to making a mining exhibit, of which branch the California State mineralogist is to have the direction. For a similar purpose the Colorado Legislature has appropriated \$50,000. Mining States should show an active interest in this exhibition, as it cannot fail to attract the attention of capital to the mining industry, and miners individually can assist their district and State by aiding, as far as possible, the commissioner, when called upon, in the preparation of a representative exhibit.

CONCENTRATES.

THE pan or born spoon test is not always satisfactory or conclusive in testing gold rock, for sometimes the gold is so fine as to be invisible to the eye.

IN laboratory practice 130 parts by weight of cyanide will dissolve 196.8 parts of gold; in commercial practice 30 to 40 parts are required to 1 part of gold in solution.

WITH an inch nozzle it would take 125 feet head of water to throw a stream of water 100 feet high. Under such pressure about 200 gallons per minute would be discharged.

A CUBIC FOOT OF WATER contains $7\frac{1}{2}$ gallons and weighs 62 $\frac{1}{2}$ pounds. A gallon contains 231 cubic inches and weighs 8 $\frac{1}{2}$ pounds. A cubic foot of sea water weighs 64.31 pounds.

GOLD is slightly lighter than platinum, the former having a specific gravity of 19.33 when pure, and the latter of 21 to 22 when chemically pure, though ordinarily from 14 to 19, owing to impurities.

THE Tonopah, Nev., ore in numerous cases shows that 1% of the money value of silver in the ore is equal to the number of ounces gold. Much of the Tonopah ore treated in the smelters has carried \$150 in silver and 1 $\frac{1}{2}$ ounces gold to the ton.

THE horse power necessary to elevate water to a given height is found by multiplying the total weight of the water in pounds by the height in feet, and divide the product by 33,000. An allowance of 25% should be made for friction in pipe line.

THE process of treating black sand for gold has been repeatedly published. To separate gold chemically attached to magnetic or non-magnetic iron sand, one way is to pulverize the iron ore, ilxviate, leach it, concentrate, and treat the concentrates.

AT an altitude of 10,000 feet 26 $\frac{1}{2}$ pounds of water entering a condenser at a temperature of 60° F., and returning at a temperature of 100° F., would be required to condense one pound of steam exhausted into the condenser, the vacuum gauge reading 14 inches of mercury.

TAKING the legalized standard miners' inches of water as fixed by the California State Legislature, at 1 $\frac{1}{2}$ cubic foot per minute, an inch of water under 410 feet head will develop about 1 H. P., or correctly, .99027 H. P. For greater quantity of water multiply by number of inches available.

THE aneroid barometer can be employed for reconnaissance, on ditch lines, railway surveys, proposed roads, etc., but it is subject to so many variations that it cannot be depended upon, ordinarily, for accurate work without numerous corrections for temperature, daily variation, etc. The first inch above sea level is equivalent to about 917 feet.

THE temperature at the bottom of Tamarack shaft No. 5, near Houghton, Mich., at a depth of about 5000 feet is 87° F. In this shaft the temperature increases on an average 1° for each 112 feet in depth, which appears to be uniformly the case with all the mines of that district. Underground temperature in mines is greatly affected by local conditions.

FRICTION in pipes in the flow of liquids increases very nearly as the square of the velocity, and inversely as the diameter of the pipe. With new wooden pipes the friction is 1.75 time greater than in iron pipes, but after a time the interior of wooden pipes becomes coated with a film of silty ooze and the friction is greatly reduced, in some instances to less than that in steel or iron pipes of same size.

TAILINGS which have accumulated on unoccupied government land may be appropriated as placers by a citizen of the United States, and they then become the exclusive property of the locator. Tailings run upon the land of another become the property of the owner of the land. If the tailings damage the land or inconvenience the owner of the land, the owner of the mill is responsible for such damage.

QUICKSILVER in the form of sulphide of mercury is not a new thing at Mercur, Utah. Indeed, it was the ore of mercury, crudely worked, that made Mercur first known in its first name of Camp Floyd district. In the Sacramento mine the dull grayish substance from which the mercury sweats out upon application of heat goes \$250 per ton quicksilver and \$8 gold. A Scott furnace is the most usual form of treatment.

AS TO the advisability of an alarm bell in the hoisting engine room, which rings when the skip or cage approaches to within 50 feet of the collar of the shaft when hoisting, there is a difference of opinion. Some believe it to be a safeguard to overwinding, and others contend that in the event of failure of the bell to ring the engineer, being unguarded, is more likely to overwind than not. A hoisting engineer occupies a responsible position

and should trust no uncertain device to determine the position of the skip or cage in the shaft, but should watch his indicator and also have a suitable "tag" on the rope to warn him of the approach of the skip. It is always advisable to slow up on approaching the stopping place, at the surface or bottom of the shaft or at one of the levels.

THE indicated horse power of single-cylinder engines may be determined as follows: The I. H. P. equals the effective pressure in pounds per square inch times the length of stroke in feet, times the area of piston, times the number of strokes per minute, divided by 33,000. For accuracy one-half the sectional area of the piston rod must be subtracted from the piston area if the rod pass through one head, and the whole area if it pass through both heads.

GRAPHITE when pure is composed of pure carbon, like diamond. At very high temperature it burns more readily than diamond, but most varieties are less easily burned. It is infusible, has a hardness of 1 to 2, color iron black, luster metallic, sometimes dull and earthy, streak metallic; occurs in beds, imbedded masses, in veins and as scales in granite and schistose rocks; a common product of blast furnaces. It contains no lead. The name black lead is common, but is a misnomer.

THE time within which action should be commenced for underground trespass has been discussed at length. The general consensus of legal opinion seems to be that the time when the statute of limitation shall commence to run shall be upon the discovery of the trespass by the injured party. The Supreme Court of Pennsylvania has established a precedent in saying, "We are disposed to hold that the statute runs against an injury committed in or to a lower stratum from the time of actual discovery, or the time when the discovery was reasonably possible."

CHROME ORE is chiefly used for manufacture of chromates or ferro-chromium, or the metal chromium. It is also the source of a reverberatory furnace lining. Buyers seek a minimum content of 50% chromium sesquioxide. It is this required percentage that hinders the profitable working of some deposits, as well as general demand, freight and treatment charges. A high percentage of silica is also a deterrent. Chromite ore will carry alumina to 19%; ferric oxide 18% to 38%; magnesia to 18%; silica to 10%; chromic sesquioxide 39% to 66%. There is plenty of the ore in California and it has been mined, but usually unprofitably, Canada and Asia Minor mostly supplying the demand.

IN the case of Jackson vs. Roby, 109, U. S., 440, the Supreme Court of the United States held that "it often happens that for the development of a mine upon which several claims have been located, expenditures are required exceeding the value of a single claim, and yet without such expenditures the claim could not be successfully worked. In such cases it has always been the practice for the owners of the different locations to combine and work them as one general claim, and expenditures which may be necessary for the development of all the claims may then be made on one of them. * * * In other words, the law permits a general system to be adopted for adjoining claims held in common, and in such case the expenditures required may be made or the labor be performed upon any one of them."

TABLES giving the properties of saturated steam, that is heat, pressure, latent heat, etc., will be found in Porter's steam engine indicator, which tables have been widely accepted by American engineers as correct. Similar tables are found in Kent's mechanical engineers' pocket book. The apparently wide difference between the horse power indicated in Pelton's water wheel catalogue and results obtained at Ymir, B. C., are due partly to an error in reading the table. A 6-foot wheel under 600 (not 400) feet head, and employing a 4-inch nozzle requiring 685 2 miners' inches of water, generates 992.65 H. P. A 6-foot wheel under 400-feet head, employing 559 35 miners' inches of water, will develop 540 35 H. P. With a smaller nozzle and other buckets than the standard for that size of wheel will develop much less than this amount of power.

WHEN by reason of failure to perform the required assessment work on a mining claim the location becomes vacant under the provisions of the law, there is no forfeiture until a second party locates and appropriates the claim. When this has been properly done the domination and control over the property pass to the latter, and thereafter the relocater is clothed with the exclusive right of possession and enjoyment of all the surface included within the lines of location (Revised Statutes, Sec. 2322). It is the general law that all improvements of any character upon public lands of the United States pass to the purchaser from the Government (Collins vs. Bartlett, 44 Cal., 371; Pennysbocker vs. McDougal, 48 Cal., 163) and the relocater holds his estate by purchase. One cannot set up equities in improvements against the Government, or a purchaser from it, and State statutes which permit their removal after the land has passed into private ownership are void. It has been frequently held that machinery, such as engines, boilers, hoisting works, mills, pumps, and things of a like character, annexed to the soil for mining, becomes part of the freehold (Merritt vs. Judd, 14 Cal., 60), and as such they will pass to the relocater. The machinery so acquired cannot be

claimed as improvements when application for patent is made. While the above applies to machinery, buildings and like improvements, ore dumped on Government mineral land likewise becomes the property of a locator who takes up the land on which the ore has been placed in the same manner that tailings may be taken by whoever may claim them when on the public domain.

TO ASCERTAIN the number of cubic feet of water flowing in a stream or ditch per minute select a place along the ditch or stream that is as nearly straight as possible for a distance of about 300 feet. Measure carefully the width of the stream at a number of places, say every 30 feet. Also measure the depth of water across the ditch at each of these places, taking several measurements to ascertain average depth. Then drop a float in the water midway of the stream and note the number of seconds it requires to travel a given number of feet. Then multiply the average width of the stream by the average depth, as determined by measurement, and multiply this product by the number of feet traveled by the float per minute. This will give the cubic feet of water passing per minute. Divide the product by sixty to ascertain the quantity per second.

IN reference to the number of placer claims that may be taken by a single individual, Lindley on Mines says: "It is a matter of frequent occurrence that an individual locator, desiring to obtain more ground than he is permitted under the law to appropriate in his individual capacity by a single location, resorts to the use of 'dummies,' and perfects locations in their names, subsequently obtaining conveyances therefor. The courts have held that this is a fraud upon the Government. The same object can be accomplished without violating the law. There is nothing to prevent a miner from locating, by separate location, as many 20-acre tracts as he pleases, either contiguous or non-contiguous. The right to locate and develop mining ground is not limited to a single location, as in the case of pre-emption and homestead entries. Where an association of eight persons takes a tract of 160 acres (the limit of one company claim) the same company may locate another 'company claim' of 160 acres. The work may be done in a single place for the group of company claims, but \$100 must be expended for each claim or area of 20 acres. Thus a company claim of 160 acres requires the expenditure of \$800."

THE mineral colemanite is the principal source of borax in California at present. Colemanite is a compact, to crystallized, sometimes earthy mineral, usually white or milky, sometimes transparent, hardness 4 to 4.5, gravity 2.42; luster vitreous to adamantine. It is a composition of boron trioxide and lime, and is commonly known as calcium borate. It was first discovered in Death valley in Inyo county, Cal., and later near Calico silver mines, where a large vein-like deposit has been worked for ten years or more. This deposit is included in shales and sandstones, being conformable with the enclosing rocks, and outcrops along the surface where the formation has been folded, and the upturned edges eroded. It dips southerly at 45° near the surface, but becomes flatter in depth. It is the result of crystallization of calcium borate deposited on the muddy floor of a tertiary lake bed. This deposit was subsequently covered by detritus accumulating in the lake and was finally brought to the surface by dynamic disturbances. The deposit has been worked to a depth of 400 feet. In depth the vein is faulted. In width it varies from a few inches to 12 feet or more. The outcrop extends a distance of 5 miles or more in an east-west direction. Near Calico, and also in the vicinity of Daggett, the mud shales have been found to contain calcium borate, and development work has been done at several places, and small quantities of boracic acid made by the claim owners on an experimental basis.

FULLER'S EARTH is a name given to a siliceous earth that has the property of removing from newly made cloth the oil which has been employed in rendering the wool pliable in weaving. This is called "fulling." It is the physical properties and not the chemical composition that constitutes Fuller's earth. The properties by which it may be distinguished are an unctuous or soapy feel, with no grit that could injure the cloth when rubbed; fine texture, and when placed in water swells up somewhat, cracks and crumbles into a mass of incoherent fine sand. It is not plastic and can not be moulded like clay, and unlike most clays, it exfoliates when burned, and cannot be used in brick making. Among other uses it is employed in filtering oils, and to some extent in lightening the color of cotton-seed oil, although for this latter, and for other vegetable oils, the English earth is preferred. The crude, black mineral oil is allowed to percolate slowly through the dry, finely ground earth placed in cylinders, whence it issues nearly colorless, and at first somewhat thinner. The oils apparently percolate at different rates, according to their densities, and it is suggested to make use of this fact for the fractional separation of crude oils into their various qualities instead of distilling. Fuller's earth usually occurs in shallow basins in swampy tracts. Below this 2 feet of surface soil is a layer of plastic, mottled clay from 2 to 6 feet thick, beneath which are the layers of Fuller's earth from 2 to 12 feet thick, above a bed of sand. After being dug out it is allowed to dry in the sun for several days, during which it loses about 50% of its weight, turning from a greenish to a creamy-white color.

Manufacture of Portland Cement in California.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS
by R. P. McLAUGHLIN.

Previous to 1862 natural cement, a mixture of lime and clay, burned in a lime kiln, was used on the Pacific coast. In that year the first Portland cement was brought to San Francisco, but could not be sold.

An interesting comparison of such a state of the cement business and that at present existing is afforded by recent statistics compiled by C. G. Yale

Ball Pulverizer, Cement Works, Tolenas, Cal.

for the California State Mining Bureau. These show that in 1901 there were produced in California 71,800 barrels of cement, valued at \$159,842, the entire output being from the Colton works. Figures obtained from the Custom House show on imports of cement at San Francisco a duty of 7 cents per 100 pounds, or 28 cents per barrel.

The manufacture of Portland cement in California has been tried several times at different places, namely, Benicia, in Solano county, Antioch, in Contra Costa county, Jamul, in San Diego county, and Santa Cruz, in Santa Cruz county. The only plant at present producing in the northern part of the State is that of the Pacific Portland Cement Co. Since August, 1902, this plant has been manufacturing 600 barrels per day, and the plant is soon to be enlarged, giving a capacity of 1400 barrels. The mills of this company are situated at Tolenas, Cal., about 5 miles above Suisun, in Solano county, on the Southern Pacific R. R., and about equal distance from Suisun bay. All supplies and cement shipped go by rail, over a railroad about 2 miles long, from the works to the main line, built and operated by the cement company. The land owned by the company comprises about 800 acres. About 300 acres of this land consists of limestone and the remainder of clay shale—the only important ingredients used in cement.

Advantage is taken of the topography of the country to apply the principle of gravity, the works being situated on steeply sloping hills near the railroad. To the north, about three-fourths of a mile from the mill and at 200 feet greater elevation, lies the limestone quarry. About 100 yards to the east of the upper building, and slightly above it, is the bank furnishing clay. All the buildings, with the exception of one, the stock house, are built entirely of steel and sheet iron on concrete foundations set in the side of the hill. Every department in the plant is connected directly by telephone with the superintendent's office. Water is not abundant, but being needed only in small quantities for water jackets, a small surface reservoir and several wells supply the demand.

The only power used is electricity, brought 2 miles from the main line of the Bay Counties Power Co. Through an oil switch the current enters the main power house, containing the switchboards and transformers, at a voltage of about 45,000. The voltage is transformed to 2000 and again to 440 for all motors of less than 50 H. P. All motors are connected separately with the power house and cut out whenever they are not in use. The total power used is from 750 to 800 H. P.

The limestone used is a massive travertine deposited from calcareous springs, with bedding almost horizontal. The deposit is at the surface, stripping being unnecessary.

With outcrops and prospect shafts, a supply for a long period has been proven. An analysis by C. J. Wheeler, the company's chemist, shows the stone to be practically pure calcium carbonate, the composition being:

Silica (SiO ₂)	32%
Ferric Oxide (Fe ₂ O ₃)	49%
Alumina (Al ₂ O ₃)	56%
Calcium Oxide (CaO)	54.45%
Magnesium Oxide (MgO)	10%
Sulphuric Anhydride (SO ₃)	13%
Alkali (.00) and Ignition loss at red heat	43.71%
Total	99.76%

The sample having been dried at 212° F., the impurity which must in general be guarded against is magnesium, over 5% not being permissible in the cement.

The rock is removed from an open cut with a face of about 20 feet high and a length of 300 feet, being hand-drilled and shot down, workmen breaking up the stone and loading it in dump carts drawn by horses. When the face has been sufficiently straightened out, cars will carry the rock to the 50 H. P. Gates crusher near by, which crushes to 2-inch or under. The building covering the crusher and bin also contains the upper terminal of the rope tramway and a 10 H. P. motor operating it. A workman operates a gate on the crusher bin and allows the buckets of

of San Francisco bay. Composition of a sample dried at 212° F., according to Mr. Wheeler:

Silica (SiO ₂)	55.14%
Ferric Oxide (Fe ₂ O ₃)	7.15%
Alumina (Al ₂ O ₃)	19.15%
Calcium (CaO)	3.19%
Magnesium (MgO)	1.66%
Sulphuric Anhydride (SO ₃)	.66%
Alkali	2.55%
Ignition loss at red heat	10.35%
Total	99.85%

Iron is an impurity to be guarded against, one of its most harmful effects being that it imparts a burnt color to the cement, and, upon exposure, weathers out, giving the rusty stain. Most specifications limit the iron contents of cement to 5%. Another harmful impurity is sulphur, the effect of which is to retard setting. The maximum of SO₃ is 2%. Free silica, or sand, is to be guarded against; but a small percentage can be tolerated if the grains are very fine, allowing close mixture and perfect chemical combination.

Sea water added to Portland cement before setting tends to retard the process, owing to the presence of magnesium salts, and, consequently, where salt water must be used in mixing, a quick-setting cement is necessary.

A small amount of alluvial is stripped from the clay, which is then plowed deep and hauled out upon a platform by scrapers drawn by horses. A trapdoor in the platform allows the clay to fall into cars on the track beneath. There is a slight slope from the clay bank to the stone house, a distance of about 100 yards, and the cars run down by gravity, the empties being made into trains and hauled back by horses. Only about one-fifth as much clay is used as of limestone, and, consequently, the clay bank is worked intermittently and a supply accumulated upon the floor of the stone house. The quarry and tramway men work ten hours every day that the weather permits.

(TO BE CONTINUED.)

An Advance in Lead.

A recent advance in the price of lead has had a salutary and stimulating effect on mining in those districts producing lead ores. While this advance,

The Ball Mills, Cement Works, Tolenas, Cal.

unloading. At the quarry end the empty bucket, upon arriving, starts the one just loaded, and at the lower end of the system an empty car, on leaving the terminal, turns over the car behind it.

A 10 H. P. motor is connected to the tramway; but after starting only about 3 H. P. is necessary to maintain the motion. The longest single span is about 600 feet.

The bin into which the tramway discharges is situated in the stone house, or highest building, and the material in passing through the mill is almost continually falling to a lower level, power being consumed by elevators in only two places. The limestone overflows from the bin to the cement floor of the house.

The clay used is of light brown color and very fine, from the general appearance probably belonging to the Knoxville shales, which cover a large area north

as announced by the American S. & R. Co., amounts to but about 40 cents per 100 pounds, it means 8 cents per unit for lead in the crude ore, and this is a very substantial increase in ore value to those mines producing large amounts of lead, as in the Coeur d'Alenes, Idaho; at Leadville, Creede, Georgetown and the San Juan region of Colorado, and the lead producing sections of Utah and the Mississippi valley fields. While the increase in the value of the ore is only from \$1 to \$5 per ton, it is an all-important matter to many mines, and to some means the difference between profit and loss in operating. The press of the lead-mining regions universally express the satisfaction miners feel at the improved situation.

In Korean mines the pay of an ordinary Coolie laborer is 15 cents per day, neither food nor lodging being provided for him.

The Crown Mica Mine, Custer City, South Dakota.*

Written for the MINING AND SCIENTIFIC PRESS by
DENNIS HENAUZ.

This mine is situated about 3 miles in a northwesterly direction from Custer City, Custer county, S. D., and consists of two claims, each 300x1500 feet, lying side by side, and running north and south.

The mica occurs in large pipes in the vein. These pipes or shoots of mica have a dip to the south (in the veins) of about 30° from horizontal and are quite regular, both as to their direction and dimensions.

It is difficult to describe the occurrence of the mica in this mine without a diagram; but if you will imagine a lot of gun barrels driven into the ground at an angle of about 30°, one above the other, you may form a fair idea of the existing geological condition.

The occurrence of these shoots of mica in the Crown mine is different from that of any other mine I have examined or of which I have any knowledge. There are five veins in this property. The shoots all take the same dip to the south, but vary in width in the different veins, being from 4 to 10 feet. To make this still plainer, I will explain by saying it is a series of veins running north and south, dipping almost perpendicular, each carrying its own series of shoots of mica in the form of pipes, which dip south to unknown depth, each shoot coming to the surface and making an irregular cropping for about 100 feet in width and about 600 feet in length.

The walls in each case are of mica slate in the Archean formation, while the gangue matter, in which the mica is found, is simply a very coarsely crystallized granite of intrusive origin. It will be understood that normal granite is composed of potash feldspar, quartz and mica, but that in this case each of the constituents have crystallized separately in exceptionally coarse masses or crystals. Thus we have the feldspar by itself, quartz by itself and mica by itself, the latter in the form of books," which vary in size from 1 inch square to 12x20 inches across.

Mica consists of a silicate of alumina, with small proportions of silicates of potash, soda, lithia, oxide of iron and manganese. The mica in this mine is plentiful and of good quality; the "books" are found in rocks of medium hardness, lie in all directions and are very irregular in shapes and sizes.

To prepare this mica for market, the largest and best mica is split into sheets of suitable thickness and cut into sizes adapted for stoves, while the more irregular pieces are simply trimmed and sold for electrical purposes.

The small mica is split very thin and built into large plates by means of an adhesive substance and heavy pressure—a patented process. The waste mica is ground into powder and is used in the manufacture of paint, axle grease, safe filling, wall paper and in various other ways.

The development consists thus far of several open cuts, the largest of which is 400 feet in length and 35 feet in depth at the face. (See illustration, page 167) One shaft is 80 feet in depth, with cross drifts of 15 and 20 feet, respectively. The main shaft (two compartments) has been sunk to a depth of 100 feet, from which level a drift has been run along the vein for 200 feet.

From the 50-foot level in this shaft a cross drift has been run, disclosing four different mica-bearing veins with their shoots, as before described.

There is a good engine building, with steam hoist, boiler and dynamo, and the mine is equipped with a motor, electric drills and steam pump. There is also a complete blacksmith shop, change house, office, boarding house and stable.

The nearest point to railroad is Berne station, on the B. & M. R. R., 1 mile north of the mine. There is some timber on the claims and it is abundant in the adjacent country, with plenty of water near for all necessary purposes.

A brief history of the property may not be uninteresting. The mine was located in 1881 by George Clark and was transferred during that year to H. C. McMacken, Thomas Haight and J. V. Offenbacher and was known as the McMacken mica mine. These parties took out and shipped about 100,000 pounds of cut stove mica, from the cuts at the surface, which sold at an average of \$2 per pound.

In the early '80s the price of mica went down; so this mine was shut down and no mica was shipped for several years.

In 1890 the mine became the property of M. Daly, who in 1895 leased it to Mr. Major of St. Louis, Mo., who worked it during the summer, took out about a carload of mica and surrendered his lease.

It was next leased to S. A. Baxter of Lima, Ohio, who took out about 5000 pounds of stove mica and about five tons of mica for electrical purposes. Mr. Baxter surrendered his lease in 1897.

In 1900 the mine was sold to the Chicago Mica Co., with F. C. N. Graydon as superintendent.

This company took out about ten carloads of mica—partly from the old dumps and partly as it came

from the mine—during the year 1900. Mr. Graydon continued to work the property until April, 1902. Since then the property has been closed down.

Lately the Crown Mica Co. has been organized for the purpose of purchasing the Crown mica claims. They have completed arrangements whereby they have a market for all they can mine. They are preparing to equip the mine with new and improved appliances and to work it on a more extensive scale.

This company has a fine field for its energies, for, notwithstanding all the work that has been done, and all the mica which has been taken out, it may be fairly said that the mine has only been scratched. From unmistakable indications, there is a large amount of mica yet to be exploited in this ground, and this generation will not see it exhausted.

There are many other mica mines surrounding Custer. Most of them are found in the micaceous slate, while there are a few found in the granite formation of the Harney range. Important among these are the New York, Lost Bonanza, Climax, Monarch, Old Mike, Russell, White Spar, Sun Dog, Gaughenbaugh, Grand View, Chapman, B. & M., Pierce, Window Light, Noble, Occidental, Shoemaker and Mica King, besides which there are many prospects which may prove to be mines in the future.

In each and all of these mines the occurrence of mica differs, and they all differ in their characteristics from the Crown.

Custer, March 2.

Machine Drilling in Stopes.

For many years the economy and effectiveness of machine drills in driving drifts in mines and in tunneling generally has been recognized, but stoping operations with the machine drill dates back only a few years, and is even now not in general use. In some stopes it is inadvisable, owing to the loose character of the ground, but in many cases the machine drill in stoping is recommended. The following hints on drilling in stopes with machine drills are given in Engineering News:

It is a most common thing in reading a description of mining operations to run across some such statement as this: "We were compelled to give up the use of machine drills in stoping, as hand drilling was cheaper."

It is seldom that the writer explains why power drills proved a failure in such stopes, although they are decidedly economic in driving crosscuts, headings and the like.

In tunnel and shaft sinking work, drills of a large size mounted on a bar are used. It naturally follows that, already owning such drills, the mine superintendent tries to use them in overhead stopes, often with discouraging results. The trouble generally is that in drilling through the ore body seams are encountered which tend to deflect the drill, causing it to bind. Forthwith the miner picks up a sledge and strikes the drill viciously, often breaking some part of the machine in his effort to loosen the drill. If the seams are numerous the miner is thus engaged more than half his time in pounding the drill; and very often a hole is completely lost through inability to drive the drill deep enough on account of its binding. The most natural thing in the world, then, is to cast aside the power drill entirely, and in so doing an expensive mistake is often made.

If instead of mounting the drill on a bar it be mounted on a tripod, the trouble due to binding may often be done away with entirely, for the very simple reason that the moment binding begins the whole machine may then be moved slightly by raising or lowering one of the tripod legs. This slight change of drill alignment may be made by the chuckman, often without stopping the running of the drill at all.

A tripod in overhead stoping, however, cannot be quickly or readily set up and moved about because of the irregularity of the broken rock surface upon which it stands. This difficulty may be easily overcome by making a rough platform of lagging, which can thus be used over and over again.

We would suggest also that a wood triangle, shown in Fig. 1, would serve the same purpose as a plat-

Fig. 1. Wood Triangle for Drill Tripods.

form, even better. Such a triangle has been used to excellent advantage in open-cut rock work. Our next suggestion for facilitating drilling in seamy ground is to make the short bits, which are used

first, larger in diameter than the longer ones. Any one familiar with drill running knows that the deeper the hole gets the more frequent and troublesome becomes the binding of the drill in seamy rock, or rock of unequal hardness.

Another expedient is to use drills of special form, having shoulders or wings extending up the drill shank for 6 or 8 inches from the cutting edge, and of diameter only a trifle less than the bit, so as to fit the hole quite snugly for these 6 or 8 inches. These wings check the tendency of the cutting edge to follow the slant of any seam encountered, as will be seen in Fig. 2.

Fig. 2. Special Drill for Seamy Rock.

In the copper mines of Lake Superior the native copper causes a great deal of binding, which grows worse with increased depth of hole. The drill runner knows that the first foot or so in seamy rock may be easy running, but after a certain depth is reached the trouble begins. Then the only thing to do is either not to drill deep holes (say only 3 to 4 feet deep), or to struggle ahead in spite of the numerous delays. A shallow hole is inefficient, a deep one is costly; the miner must set the one against the other and split the difference.

If a small drill is started in a larger hole there is still some danger of binding due to the failure of the small drill to follow the center of the large hole. The small drill crowds off to one side. Even so it does not stick so frequently and persistently as in holes of uniform diameter. A collar might be provided for the smaller drill, to center it in the hole at the start, although there are some practical objections to the use of such a collar. Finally, we come to the weight of the power drill used. In narrow stopes the large size ordinarily used is entirely "out of the running," because it cannot be set up and handled at all in a very confined space. Then one of the small "Baby" drills, weighing 175 pounds, tripod and all, may be used to advantage. It will take some little time and judgment for a miner accustomed to the large drill on a bar to learn how best to handle the "Baby" drill on a tripod. Such a drill when properly handled, however, will readily drill 40 feet in seven hours in quartz full of slips; and two men using hand drills in the same kind of rock have been known to stop just half as much ore per shift as they did afterward using the "Baby" drill on a tripod.

Many mine managers are too ready to accept the verdict of old miners relative to the value of power drilling in stopes. The miner, as a rule, is not a very patient man, and becomes easily disgusted with a machine if it fails to work satisfactorily right away. For this reason the boss or manager can spend time to no better advantage than in standing right by a new machine, or an old one, in new ground. He will then frequently discover a cause of trouble that a less intelligent or less interested man would never see.

Tailings at Ely, Nevada.

TO THE EDITOR:—I wish to call attention to a letter published in the MINING AND SCIENTIFIC PRESS of Feb. 28, from W. H. Wickham, headed "Cyaniding at Ely, Nev." Mr. Wickham presents, as an illustration of Chainman ores, the results of eight tanks. The average heads of the first five is \$3.07; tails, 83 cents. The other three average: Heads, \$3.51; tails, \$2.11. Now, since Mr. Wickham left the employ of the Chainman Co. there has been at least a dozen assays made from the tailings dump. Of the first five the lowest was \$1.80, the highest \$4.80. Another hatch of assays averaged \$3.80, and still another assay, taken from ten different places, assayed \$6.24.

A tank of ore that Mr. Wickham leached, that is now in the tanks at the Chainman mill, was sampled by Mr. Corning, of Olcott, Corning & Peale of New York, and found to contain a valuation of \$6 a ton.

High Benches of the Nome Gold Fields.

Written for the MINING AND SCIENTIFIC PRESS by
OTTO HALLA.

On the divide of Anvil and Dexter creeks in the Nome region, at an elevation of about 500 feet from the level of the sea, in 1900 a discovery was made of auriferous gravels at a depth of 40 feet. This discovery was followed by many more so that towards the end of the season of 1900 a string of valuable claims have been found on the benches off Dexter creek and crossing the divide to Anvil creek. All of them have proven to be rich. The Mattie F., the first claim discovered, has produced in the neighborhood of \$250,000 up to date; the Madeleine, the Daisy, the Snowflake, Sugar, Honey, Molasses and Bowery all are properties which will in time add materially to the output of gold of Nome. The discovery of the rich bench ground has stimulated the prospecting of the hillsides and benches of other creeks, and invariably the result has been satisfactory. It has proven in many instances that benches of low-paying creeks are better than the creek claims, as is the case on Dry creek where a little pay has been found, but nothing in comparison to the valuable bench ground of that creek.

Now the question may be asked, what caused the change in the channels of the creeks and why are the present creek beds spotted, one claim rich in auriferous gravels and the other adjoining it not containing anything? There is no doubt that the creeks at the time of the first gold run had an entire different watershed, in fact it seems that the present watershed is almost diagonal to the original run of the creeks. This may be due to different causes, the most plausible of which is, the uplift of a whole section of the peninsula, causing the creeks and river to seek other outlets, and in their course forming new ravines, creeks and rivers. The auriferous gravels lifted up, formed the benches in many instances which were covered by mountain slides and also finally by glaciers. The new rivers and creeks were fed by tributaries deriving their source in those same old channels, and naturally they in turn would have gold washed into their beds, depending in many instances on the richness of the old river channels for their values. Where a large creek crossed the old channel, there would be a larger deposit of gold, the amount of water causing the more wash down the mountain.

This is what happened in the Nome region at any rate. Looking from the diggings of the Sugar claim in a westerly direction one may observe the continued string of paying claims to Nekkla gulch, then to Anvil creek, across the other divide to Snow gulch, then Glacier creek, and then to the Hot Air bench. The streak has not been traced farther. The Snake river intervenes at that point, and it may have turned northward, as a paystreak again is found on Oregon creek benches, which compares very favorably with any ground in the neighborhood of Nome. Beyond, again a gap of unprospected ground, and finally the paystreak makes its appearance in the benches of Gold Run. On the other hand, it travels southeasterly to Buster creek across Osborn, where it is completely lost. This, however, is not the only streak of paying gravels. The headwaters of Nome river have a distinct paystreak of their own, by which its benches are fed, as large deposits of gold-bearing gravels have been found over 1 mile off the present channel of the river. So has Solomon river its own feeder, commencing at Topkok, crossing to Big Hurrah, Solomon and Kasson creek, where the trace is lost. And so throughout the whole section. It depends upon the lay of the creek, the direction in which it runs and the supply it has to draw from whether it is a paying creek or not. It depends where the old channel crosses it whether the claim is a blank or not. Cases of this kind are demonstrated on Glacier creek. Not one claim above Snow gulch has paid, for the reason that its headwaters do not have their source in any of the old channels of the gold-bearing gravel.

Bench prospecting has received during the last year a great impetus, on account of the discoveries of the Anvil and Dexter benches. It is, however, more expensive than ordinary creek prospecting, but its importance is daily being more demonstrated, and the possibilities of gold output as the result of the discoveries already made are such that they will make bench prospecting even more lucrative than developments on creeks.

There is a vast area of bench land on the Seward peninsula which will sooner or later be productive; there has to be, however, capital invested in prospecting the ground. Up to now very few individuals or mining companies have paid out a large amount of money for legitimate prospecting but what they have been more than a hundredfold repaid; the cases of C. D. Lane, the Wild Goose M. Co., the Pioneer M. Co., the Alaska G. M. Co., Mathews & Co., and Kelly & Co. may be cited as instances. Of course, where mining companies are organized for the sole benefit of the promoters, and do nothing whatever in

developing the ground, these cannot expect even to be considered as operators in the gold fields.

The discovery of the Nome gold fields is the repetition of the California discovery of gold as far as the amount of gold produced will be concerned; the short season of hydraulic mining (four months) may have the tendency to prolong the period of extraction for many more years, but on the other hand there are no agricultural interests to be taken into consideration, and a legitimate investment of capital in the

N. A. Copper Mining Co.'s Aerial Tramway, Grand Encampment, Wyoming.

Written for the MINING AND SCIENTIFIC PRESS.

The difficult question of transporting the ore from the Ferris-Haggerty mine, Rudefeba, Carbon county, Wyoming, to the smelter at Grand Encampment, re-

Tramway Terminal at Smelter, Encampment, Wyo.

Shaft House, Haggerty Mine, Encampment, Wyo.

shape of hydraulic pipe systems, pumping plants and of permanent improvements will bring its returns, more than any other business investment, for many years to come. The creeks will be washed out in a few years, but the future of this section lies in the immense deposits of auriferous gravel of the high benches.

Nome, Alaska, December 1, 1902.

COLOMBIA leads the South American countries in the output of gold for 1902 with \$2,775,400. Brazil produced \$2,801,000 gold and \$1,129,000 silver, Chile \$1,067,000 gold and \$5,553,000 silver, Peru \$1,329,000 gold and \$3,360,000 silver, Bolivia \$6,157,600 silver.

sulted in the building of an aerial tramway, a distance of 16.1 miles. The idea of thus handling the Ferris-Haggerty ore was originated by W. G. Emerson and B. McCaffery of Denver, Colorado. The contract for the erection of the tramway was given to the Mine & Smelter Supply Co. of Denver, who engaged B. C. Riblet of Spokane as consulting engineer. The material was furnished by A. Leschen & Sons Rope Co. of St. Louis, Mo. The material was hauled to Grand Encampment, 45 miles from the railroad, and from there distributed along the line of tramway.

To facilitate the construction it was necessary to build 24 miles of wagon road. Cables weighing 17,-

000 pounds, and requiring twenty horses to haul same, were taken over this road.

On February 24th, 1902, the surveying corps commenced locating the line and taking elevations. The altitude of the loading station at the mine is 9500 feet. The discharging terminal at the smelter is 7200 feet above the sea. The line at an elevation of 10,860 feet crosses the Continental divide just south of Bridge's Peak. Profiles were then made and the derricks located. A strip of ground 100 feet wide

way was in operation on September 26, 1902.

The tramway is constructed in four sections, each section having a fall of from 500 to 700 feet. There are two slight angles in the alignment to avoid the impassable country and also to divide the fall as near uniform as possible in the various sections.

There are 289 derricks on the line. The spans vary from 250 to 2100 feet, two of them being 1950 and one 2100 feet. The derricks are of the four-post type and are made of sawed timber. The average

The traction rope has a speed of 250 feet per minute. The track cables for conveying the loaded buckets are 1½-inch in diameter, made of crucible cast steel, seven wires, six strands lang-lay. The traction ropes on the lower sections are ¾ inch in diameter, made of crucible cast steel lang-lay, nineteen wires. The track rope is made up in 1-mile sections, the tension being maintained by tension stations. The traction rope is made in 2-mile sections.

Near the middle of the line the ore is dumped from the buckets into a bin and from there drawn off into the buckets on the next section below. At the other sections the buckets, after being automatically detached, are transferred from one section to the other and automatically attached to the next section. At the lower terminal the ore is automatically distributed into a series of bins by means of a device designed by B. C. Riblet.

A telephone system was constructed as fast as the derricks were erected, a line being kept up every day with the erection. Portable phones were provided along the line and the construction work was always in direct communication with the engineer's office, material yards, warehouses, etc. From 50 to 260 men were employed on the work.

The power for operating the tramway is furnished by four side-crank engines. The engines on the two lower sections, where the fall is greatest, are 40 H. P. each, and on the two upper sections 60 and 90 H. P. The engines are provided with link motions. It is the intention of the company to drive the tramway by electric motors as soon as their new power plant is completed.

Before the completion of the tramway it was sold to the North American Copper M. Co., who are doing considerable work in and around Grand Encampment.

Pyritic Smelting.*

NUMBER II.—CONCLUDED.

By FRANKLIN R. CARPENTER, Ph. D.

A typical example of the second class, where the ore is 50% silica and alumina, and the remaining 50% mixed sulphides, but mainly iron pyrite, calls for the following charge with cold blast: 1000 parts ore, 800 parts limestone, 300 parts coke.

The concentration will be about 15 tons of ore into 1 ton of matte, with a 40% to 46% silica slag, and a cost of \$4.50 per ton. This ore carries sufficient pyrite and copper to form a matte so that all the ore treated bears a smelting charge. This case will approximate to one of the third class in the proportion in which we can replace the limestone and coke with iron pyrite. The fuel value of the pyrite may be taken at 0.4 that of coke, and its fluxing value approximately as the given weight of metallic iron, replacing the equivalent weight of CaO. It will be necessary to heat the blast. A short calculation will show that to replace all of the coke it will require $300 \div 0.4 = 750$ pounds of pyrite. Roughly, also, we may consider the pyrite as carrying an excess of 40% Fe, and the limestone 50% CaO, so that this percentage of pyrite will replace 600 pounds of limestone, and the charge becomes 1000 pounds of ore, 200 pounds of limestone, 750 pounds of pyrite—1950 pounds.

The charge will require 5% coke and 10 tons of coal per day for the hot air stove. If the pyrite is also an ore that will stand a smelting charge, the cost will be lowered to \$1.40 per ton of pay ore. It may be that a smelting charge cannot be had upon the pyrite, but, as at Buena Vista, Colo., it costs the works, delivered f. o. b., its whole gold and silver value. But as it is still both flux and fuel for the siliceous ore, it may be advisable to use it. In this case the cost per ton on the above charge would still be reduced, but only to \$2.42. It will be observed that as we have extra heat from the stove it would seem that no coke would be needed, but this blissful state of affairs, while theoretically possible, is never reached in practice. Either from the impossibility of securing the theoretical full value of the pyrite, owing to irregularities in the ore, or in the working of the furnace, or because of mechanical conditions of the ores, some coke is always required.

The third, or last, example of pyritic smelting in all its completeness occurs when heavy pyrite ores are to be smelted, and reference may be had to Keswick, Cal., for example.

Anyone can employ pyritic smelting as I have here sketched it. It is not a patented process, either with cold blast or with hot blast.

There are, indeed, many patented devices, such as special styles of furnaces, or special methods of heating the blast. One inventor utilizes the waste heat of the slag—most promisingly, it is said—Mr. Lang's method. Another claims that he employs his forehearth effectually for the purpose, while others utilize the waste heat from the top of the furnace. Devices for this last scheme are as old as the hot blast itself, and it is doubtful if modern ideas are more effectual than the ancient unpatented devices, drawings of which may be seen in "Overman's Metallurgy," published in 1852, and others more ancient,

was cleared of brush and trees. Foundations for the derricks were staked out and the excavating begun. The timber was hauled from the mills to the framing yards located at intervals along the line. The derricks were all framed and marked by letters and numbers showing the position of each stick. They were then distributed along the line and the erecting crew raised the derricks and bolted them together. The saddles and sheaves were then put on, and finally the cables were strung. The progress of the work was limited entirely by the delivery of the material. The snow did not leave the upper section sufficiently to permit of the surveying being completed until the latter part of July. In one day as many as eleven derricks were erected, and frequently in the same length of time a mile of cable was placed in position. The work was carried on from camps, which were located along the line every 4 or 5 miles. The tram-

height is about 30 feet, but several reach the height of 70 feet. The derricks are constructed unusually high on account of the excessive snowfall, which in some places along the line reaches 30 to 35 feet in depth.

There is no angle in the track rope of more than 3° over any derrick. The derricks are arranged to conform to the unloaded cables, so there is no danger of the cables lifting out of the saddles when the line is stripped of its buckets, nor of the traction rope, even under its maximum strain, being lifted off its sheaves. An adjustment is provided whereby the sheaves supporting the traction rope can always be adjusted to the right height without stopping the tramway, an arrangement which will be appreciated by the party operating the tramway.

The tramway has a capacity of 500 tons per day. The buckets have a capacity of 650 pounds each.

of stoves placed at the top of the furnace—in chambers leading from the top—stoves heated partly by waste heat and partly by extra fuel, all of which may be employed by anyone. Without intending to say anything for or against any of these patented devices, my own impression is that one cannot forever get something for nothing, and that the proper method is to erect a stove upon established and tried methods, to heat it with extra fuel, and to figure the cost. Any stove for this purpose—unlike those for iron smelting, where there are waste gases to be utilized—must be heated by extraneous fuel. I employ an ordinary "U" pipe stove. It consists of sixty "U" pipes, 8 inches in internal diameter and 12½ feet long, or, if counting the curve in the "U," each pipe is 25 feet in length. This is intended for one furnace 3 feet by 16 feet at the tuyeres, which now with cold blast smelts from 300 to 400 tons charge daily. This form of the "U" pipe is not insisted upon. Any other form will doubtless do as well, and their forms are multitudinous, for, as Percy remarks, since the hot air stove was invented by Nielson in 1828 probably no metallurgical device has so exercised the ingenuity of inventors.

A brick stove could doubtless be used, employing oil or gaseous fuel. I am not aware that it has yet been used in pyritic smelting, but if possible I shall soon give it a trial. A "U" pipe stove such as I use will cost, complete, \$10,000, while duplicate brick stoves with gas producers, etc., will cost \$35,000.

COST OF A PLANT.—The medium-sized plant at Golden is as good an arrangement as I have been able to devise. It is a compromise between a terrace plant and one upon a plane.

The same before the stove was added consisted of one very large blast furnace, sampling works, ore bins, power plant, offices, etc., and cost, complete and ready to run, with cold blast, \$90,000, or with hot blast \$100,000.

A large plant, like that at Florence or Deadwood, costs about \$200,000, while if a complete refinery, consisting of a lead furnace, softening furnace, Parkes process, etc., is added, \$50,000 more at least must be included.

Upon the other hand, less effective plants can be erected. A plant for the ores of a single mine—or not requiring sampling works—capable of smelting from 50 to 75 tons of ore daily may be erected for \$10,000, if in an accessible section. This I consider the minimum cost of an effective plant. It will consist of engine, boiler, blower and stack, but no sampling works, little or no dust chamber, and no offices. This was the cost of the first experimental Deadwood & Delaware Smelting Co. plant, which did good work.

SCOPE OF THE PROCESS.—I do not think that pyritic smelting can ever replace the lead process for custom plants like those of Colorado. It is also unsuited for very rich ores, which would best be sold to the large smelting works, but, for out-of-the-way places, or for rendering valuable those ores that do not lend themselves readily to water concentration, it has a field. It is also suitable for ores from a particular mine or section, where both mine and smelter are under one management; for ores can be treated at the mine or in the vicinity which could not be transported to a distance and sold to advantage. The attempts at pyritic smelting are many, the successes few and far between. The old works mentioned in the metallurgies—the one at Toston, at Boulder, Mont., at Mineral, Idaho, at Leadville and at Kokomo, Colo.—have all ceased to run, and most of them years ago. It is doubtful if any of them will ever run. Upon the other hand, the principles so laboriously worked out by these pioneers have been utilized at other places, and by other men, and bid fair to profoundly affect the metallurgical profession.

THE REFINING AND DISPOSITION OF THE MATTE.—In the revival of this ancient process of pyritic smelting no one until recently sought to revive their methods of refining the matte. This matte, when low in copper and high in iron, was a desirable product for the lead smelters, who bought it, paying therefor barely its full gold, silver and copper values, that they might obtain the iron free for flux. This left the refining charges practically nothing beyond freight and a nominal charge—in some instances nothing—for the mechanical handling of the product. It is none the less desirable now, but since the various lead smelters have been united under one management there is no longer any competition for it, and they have made a higher refining charge. Even now, however, they are not extravagant, although every pyritic smelter is in a small way a rival to the great company. Ordinarily, therefore, it is still more profitable to sell to the trust than to attempt refining. But plants remote from railroads, or, for other causes, finding it inexpedient to sell to the American Smelting & Refining Co., have the question to meet.

In the old days matte made by the raw or pyritic process was almost invariably treated by a process called in Germany "eintrankheit," which is usually rendered into English by the expression "lead soaking." If the matte contained little or no copper it was simple enough. The hot matte was tapped into pits, or forehearth, containing lead, or to which lead was added. When the lead was sufficiently enriched it was cupelled, for this was before

the days of Pattisonizing or of the Parkes process. Not a very high percentage was extracted in this way, but that remaining in the matte was not lost, as the partially desilverized matte was returned to the ore smelting, just as any other pyritic material. A certain percentage was thus tied up, but in the end was recovered. Had this matte been smelted directly with the metallic lead, a far larger percentage of the values would have been had at once, but the loss of lead would have been infinitely greater. If the matte contained copper, as was usually the case, the process was more complicated, as metallic copper must in the end be produced, and this would carry values that could only be recovered by the truly ancient means of liquation. Probably the highest development of the lead soaking process was to be seen at Kongsberg, Norway. The ores carried no lead at all, and the whole of it, in the form of pig lead, was imported direct from England. The pyrite used, however, carried copper, which much complicated the process. Yet such a degree of skill was developed that ores carrying less than \$4 per ton of 2000 pounds, if delivered at the works free from other charges, could be smelted and refined without loss. The whole cost, therefore, including smelting, refining, loss of lead—when it was much higher in value than now—was less than \$4 per American ton, and the amount recovered was slightly in excess of the assay value of the ore. A full description can be seen in "Percy's Metallurgy of Silver and Gold," page 504, et seq. This process was maintained there for nearly three hundred years, but recently has given way to the electrolytic process. At Mansfeld, Germany, silver-copper mines were opened seven hundred years ago. The product obtained has always been a silver-bearing matte. From these mines were obtained very largely the gold and silver which developed modern European civilization. Here originated liquation, amalgamation, the processes of Augustin and Ziervogel. All had their day, and in the order named. But here, too, electrolysis is displacing all other methods. The Ziervogel, the last named and most beautiful of the old processes, was introduced into America by Richard Pearce at his works at Black Hawk, Colo., and later at Argo, near Denver, Colo., where it is still employed. His full description of it, published in the Transactions of the American Institute of Mining Engineers, has become classic—at least as much so as anything metallurgical can become in America. Mr. Pearce also, for a while, employed the Augustin process, but neither of these processes provided for the extraction of the gold—which is at Argo obtained by other means, of which we know nothing, save our conjectures. After the silver is recovered by the Ziervogel process the gold is easily concentrated into copper bottoms, which gives a gold-copper alloy that may be treated by one of the many processes. In the end this field will be occupied, I believe, by the electrolytic method, to the exclusion of all others. The matte made at our plant at Deadwood, except that it was made by blast furnaces, resembled that at Argo, save that it was far richer in gold. It has always been treated by lead, notwithstanding its high copper tenor. It is crushed, sampled, and sold as an ore. It was then added direct to the lead furnaces employed at Omaha in gold and silver ore smelting. The very high grade copper matte thus treated came out of the furnace much lower in copper than it went in, as it was adulterated by the other matte formed in the ore smelting. It was, apparently, a step backward, but in reality it was not so, for it had given up to the base bullion nearly the whole of its gold, and in the subsequent matte refining it mattered little whether the matte was 10% or 20% copper—the result was the same. After this point it was no longer my process, and, while perfectly familiar with it, I do not feel at liberty to describe it. The matte treatment, however, can be continued as lead smelters usually perform it—for which reference can be had to Hofman, or Schnabel, or Collins.

In any of the lead soaking or lead smelting processes the base bullion, or the work blei, as the Germans call it, may be refined by the ordinary Parkes process. A complete plant of this kind is simple, consisting of a softening furnace, desilverizing kettles, refining furnace, zinc retorts, and cupelling furnace, and if the production of market lead is not the object, but only the freeing of matte from its value, \$20,000 will be ample for its erection, while \$50,000 will give a very complete plant, capable of producing market lead and blister copper.

Such a plant, avowedly experimental, was designed by me. A small round furnace was for the resmelting of the matte, either with lead or lead compounds—or for the simple melting down of the matte—which was then allowed to run into either one of the two "leading" furnaces. They were arranged to be used alternately. In either of the two furnaces two or more soakings could be had (in Russia four were formerly employed), the lead from the first going direct to the cupel, while that from the second, third or fourth soaking or washing was used over. From the leading furnace the enriched matte was to be drawn into the softening furnace, and thence to the desilverizing kettles for the Parkes process, differing in no way from ordinary refineries. The discharged matte went to the test furnaces, where the lead in the form of slag was recovered, and the matte was raised in copper contents until rich enough to ship, or even

until black copper was formed. The first part of the process was borrowed directly from the old European practice, and the second was simply an addition of modern methods of refining the lead. Had it been desirable to have employed a lead furnace the lead soaking would have been avoided, and simply softening furnaces used, which was the modification finally made by my successor.

An attempt was made to do "lead washing" at Pueblo, Colo., some years since by Crookes. The desilverizing part is said to have been most perfect, but the process failed on account of the cost. But whether it was the first part, viz., the "lead washing," or in the latter part, where refined copper was made, I am not informed, but I believe that it was the copper end that failed.

OTHER PROCESSES.—The copper-bearing matte may be roasted and smelted with siliceous ore directly for black copper, which will carry most of the gold-silver values, while the rich slags produced by this step may be returned to the ore furnace.

Having obtained black copper, there is now no difficulty in disposing of it. Owing to its compact form, it can be shipped to seaboard refineries, or even to Europe, and good prices received for it, but it is difficult to sample it properly. If we do not wish to take the risk we may at once treat it by any of the following processes:

1. It may be refined electrolytically. The products are refined copper, which is cast into ingots and sold as such. The slimes are smelted and cast into dore bars. Doubtless this is the best of the many processes, and while it requires a moderately costly plant the real objection is that it ties up much value for long periods, and refined copper is not usually the main object in pyritic smelting.

2. Sulphuric acid. It may be dissolved in sulphuric acid, giving rise to:

- a. Slimes, carrying gold and silver, which are refined and cast into dore bars as before, and

- b. Copper sulphate, which is purified and sold as such. This process is very cheap, if one can sell the sulphate so produced, as more than the value of the acid and copper may be had for it, but owing to the control of the market by large companies it is difficult to sell at good prices. As it is a by-product, however, the main object having been the recovery of gold and silver, one is not obliged to get the highest price for it in order to justify the process.

3. The Jars process for gold. As this may be a new process to many, I will state why I have suggested this name. Jars, in 1780, in his "Voyages Metallurgiques," proposed this method to separate gold from metallic copper. It is probable that Jars had in mind only the "plate bottoms" obtained by the Welsb process of making "best selected copper," where the gold, along with many other impurities, is concentrated into impure copper. Having obtained these bottoms from matte, Jars proposed to cast them back into matte by granulating, roasting and fusing with sulphide material, and to repeat upon the matte so formed the copper bottom process, where a new bottom still carrying the gold would be obtained, but only a tenth of the size of the first. Of course, it is not necessary to actually repeat all the details of making bottoms, as a simple scorification with sulphide material would answer.

When applied to pyritic smelting all these processes have their peculiar disadvantages. Pyritic plants are usually built in out-of-the-way places, or in connection with particular mines. The object is the securing of gold and silver by the most direct methods. If the matte is resmelted with lead, the subsequent desilverizing by Parkes' process and refining the lead for market is somewhat complicated. The Ziervogel process, besides not recovering the gold, is a most delicate operation, requiring much skill, and while it may be supplemented by sulphuric acid, or by the process of Jars, I have sought some more direct process, and have devised the following: I propose to obtain in the ore smelting a very low grade copper matte, carrying say 5% copper. This will represent an average concentration of 12 tons of ore into 1 ton of matte. This I roast and smelt direct for black copper, obtaining, besides black copper, rich slags, which I return to the ore smelting furnace. The copper now represents a concentration of 200 to 240 tons of ore into 1. This I cupel directly with metallic lead, about six parts usually carrying off one of copper, obtaining at one operation

- a. Coppery litharge.

- b. Dore bars.

The coppery litharge is resmelted probably in a small blast furnace so as to obtain therefrom

- a. Metallic lead.

- b. Lead matte.

This lead, after softening, if need be, is used over with fresh copper, and the lead matte goes to a test furnace, which furnace was originally designed for my use in a slightly different process. The products are

- a. Metallic copper.

- b. Lead copper slag.

The latter is smelted in the small blast furnace along with the coppery litharge from the cupelling furnace, where both lead and copper are recovered.

I have also succeeded in scorifying the metallic copper with silica, and separating the gold and silver, which process has been the subject of a United States patent.

Copper Mining in Upper Michigan.*

Written by J. F. JACKSON.

Bordering the greatest fresh water lake in the world are iron mines of such vast extent and producing such immense quantities of ore as to almost stagger belief. The engineering features developed

metallic copper and other substances which have been deposited in them hypercolating ground waters. The ground waters are supposed to have gathered the molecules of copper from the adjacent trap rock. There are dozens of these amygdaloid lodes within the 3 miles of the mineral belt, many of which contain more or less copper in some portion of their length, but only a few have, after development, proved to

ancient mines were undoubtedly the source of copper knives, fishhooks and other implements so much prized by the archaeologists. The government land surveys of this district were made in 1844, and active mining for copper was begun at about the same time, and has continued ever since. Many of the early miners came from the old tin and copper mines of Cornwall, England, and Cornishmen and their descendants are to-day the leading mining men of the district. In early days the country was reached by steam and sailing boats via the Great Lakes. All copper was shipped out and supplies brought in by boat. Direct connection by rail was not obtained until 1886, twenty years after the great Calumet & Hecla was opened. The price of copper has varied from 60 cents to 10 cents per pound, so that the country has had a succession of booms and times of depression. The great development of electrical machinery within the last ten years has, of course, greatly stimulated production, and many new mines have been opened. At present the great producers are the Calumet & Hecla, Tamarack, Osceola, Quincy, Champion, Trimountain and Wolverine, besides several small ones. Owing to the fact that United States surveys were made in 1844, ownership and description of mineral lands are by sections, quarter sections, etc., instead of by mining claims located at apex of lodes as in Western States. This fact has probably saved a great amount of litigation.

In attempting to describe the process of getting out copper in this district, I shall, for the sake of clearness, make statements which are true in general without noting every little exception, and I fear, also, without being able to arrange my facts in logical order. In general, copper in Montana and Arizona is found in the shape of an ore, such as a carbonate or sulphide of the metal, whereas the copper of Lake Superior is found in the pure metallic state incorporated in amygdaloids, or conglomerates, of which it forms $\frac{1}{2}$ to $\frac{4}{100}$. A copper lode is usually from 12 to 20 feet in thickness and extends from at or near the surface in a broad flat layer of indefinite extent into the earth at an angle or dip from the horizontal of from 25° to 70° . The Calumet & Hecla has a dip of 38° and the Quincy 50° . In opening a lode shafts are sunk at intervals of 1000 feet or more apart and follow down the inclination of the lode. Shafts are generally divided into three compartments and measure about 6 feet by 18 inches inside of timbers, giving two compartments for skip tracks of standard gauge and a third compartment for ladders and pipes. Fig. 2 shows the underground workings of the Wolverine mine.

(TO BE CONTINUED.)

Boiler-Tube Cleaner.

The accompanying illustration shows the latest form of the turbine boiler-tube cleaner made by the Lagonda Manufacturing Co. of Springfield, Ohio, from the designs of Mr. Weinland, who, it is claimed, was the first man to put a turbine cleaner to practical use cleaning boiler tubes, the present machine being the natural outgrowth from the original during the 20 years' experience in making and using such machines. The motive power for driving the star-shaped cutters is the stream of water which flows through the turbine buckets shown, the rotary motion of which is transferred to a spider carrying the cutter arms. The water is brought to the cleaner under pressure through a hose attached to the back end by a patent coupling, which makes a perfectly smooth connection without any obstruction to the movement of the machine through the tubes or the water through the hose. The arms carrying the cutters are pivoted in the spider so as to move freely, the centrifugal force, when the cleaner is at work, forcing them against the tube. This spider is screwed fast to the turbine hocket wheel, which revolves on two sets of ball bearings. The head of the bolt holding the turbine in the shell and a steel cone set into the shell form the cones of the ball bearings, the cups being on either end of the turbine wheel. The guides for leading the water to the hockets are cut through the inner partition of the shell, as shown, and the water after leaving the cleaner serves to wash the refuse out of the tube and away from the

Weinland Boiler-Tube Cleaner.

met & Hecla and the Franklin Jr. mines are developed on conglomerate lodes. The copper in this case is found in the interstices between the pebbles. Those interested in the geology of the country will find the subject ably treated in Foster & Whitney's government report.

A word as to the history of the country may not

The copper range, or mineral-bearing formation, which is about 3 miles in width, extends from Keweenaw Point in a southwesterly direction about 60 miles to Ontonagon. Its course is generally parallel to the shore of Lake Superior. (See Fig. 1). Copper is also found at various places as far west as a point on the St. Croix river, south of Duluth. It is not a particularly rough or rocky country. There are outcrops of rocks, but most of the country is covered with from 10 to 200 feet of glacial drift supporting a heavy hardwood forest. This band of mineral bearing formation is composed of hundreds of more or less parallel beds or strata of alternating traps, amygdaloids and conglomerates. The strata, where edges show at the surface, dip to the north under Lake Superior, at angles varying from 25° to 70° from the horizontal. Passing under the lake some of them outcrop again on the other side at Isle Royale, where the dip is to the south, or just the opposite. Geologists will tell you that this mineral belt is bounded on north and south or on top and bottom by sandstones, and that amygdaloids and traps are merely the tops and bottoms of great flows of lava, the tops of the flows being something like slag, quite soft and full of vesicular cavities formed by expanding gas or steam when the material was deposited, and in a plastic condition. These amygdaloids or almond-shaped cavities, varying in size from huckshot down, are filled more or less with

Map of Keweenaw Point, Mich.

in this region have been waiting for some years for adequate description from an engineering point of view. Many of us have only a vague memory that our school geographies showed—a small peninsula extending into Lake Superior, upon which the word copper was marked. Copper has been mined in upper Michigan since 1844, when Chicago and Milwaukee were hardly more than small villages.

have sufficient mineral to make a paying mine. Amygdaloid lodes which are developed vary in thickness from 10 to 40 feet or more, and are often opened underground for a mile or more in depth and from one to three miles in length.

Besides the amygdaloid copper-bearing lodes there are many beds of conglomerates, which are simply beds of each gravel cemented together. The Calu-

WOLVERINE MINE

FIG. 2.

Longitudinal Vertical Section Wolverine Mine.

Mining and Metallurgical Patents.

PATENTS ISSUED MARCH 10, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

GRAPHITE SEPARATOR.—No. 722,211; J. H. Davis, Glen Falls, N. Y.

Means for feeding powdered graphite to a separator, including hopper, provided with a series of holes or openings in its bottom, series pointed pins adapted to enter holes, means for reciprocating pins into and out of holes, whereby holes are left completely open at times and completely closed at other times, distributing board, and means for moving board back and forth.

PROCESS OF REDUCING IRON FROM ITS ORE.—No. 722,253; M. Ruthenberg, Philadelphia, Pa.

Process of reducing iron ores to metallic state, continuous; consists in detaining each particle of mass of comminuted ore for definite time in region heated to determined degree less than reducing temperature, but temperature at which it is capable of being immediately deoxidized; then progressing particles of ore in granular form, and at determined rate through atmosphere of deoxidizing gas heated to such a degree as to effect reduction of particles during movement therethrough, without fusing particles; progressing reduced metal in granular form, at reducing temperature, into region of fusing temperature; and fusing reduced metal.

DISCHARGE MEANS FOR TANKS.—No. 722,314; H. Mitchell, Salt Lake City, Utah.

Discharge apparatus for tanks provided with casting having upwardly projecting rim provided with

shoulders having longitudinally inclined under faces, funnel having base provided with depending offset portion, a gasket mounted in recess formed by offset portion and adapted to seat upon top of rim, lugs formed on depending portion and provided with longitudinally curved upper faces to engage inclined faces of shoulders, and operating handles at top of funnel.

ELECTRIC FURNACE.—No. 722,411; A. Shade, Chicago, Ill.

Electric furnace provided with passage inclined from upper to lower end provided in bottom with trough-like depression through which material to be acted upon passes by gravity, electrodes extending into passage with inner ends located above bottom of trough-like depression in manner to form plurality of arcs in passage, and separate means associated with each pair of electrodes for deflecting or elongating arcs into depression toward material as it passes successively beneath pairs of electrodes.

PLANT FOR HANDLING ORES.—No. 722,425; G. H. Hulett, Cleveland, Ohio.

Ore handling plant, comprising loading device, two sets of traveling bins to be moved adjacent to loading device for ore, and coke and limestone, scale lorry disposed between sets of traveling bins into which bins discharge, skip arranged to receive material from scale lorry and carry it to top of furnace.

AERIAL TRAMWAY.—No. 722,557; J. N. Bellwald, Trenton, N. J.

In aerial tramway, combination of fixed towers, saddles pivotally mounted upon towers, track cable passing over saddles, which automatically incline to conform to deflections of cable, means for normally maintaining saddles at prescribed angles to towers and automatically adjusting them in contact with

cable as latter changes its position under variations in load, and means acting directly on cable and wholly independent of towers for limiting deflection of cable according to load thereon.

CONVEYOR BELT.—No. 722,252; H. D. Richards, Sutter Creek, Cal.

Combination of belt provided with longitudinal endless walls, along its edges, walls being provided with longitudinal V-shaped grooves therein, with drum having annular V-shaped ribs or projections to engage grooves.

PROCESS OF PRECIPITATING GOLD FROM CYANIDE SOLUTIONS.—No. 722,455; A. Prister, Gradisca, Austria-Hungary.

Precipitation of gold and other precious metals from cyanide solutions, such as potassium cyanide, sodium cyanide and bromine cyanide, which consists in acidifying solution, then adding mercurous salt in combination with small quantities of copper salt; adding solution containing zinc salts and small percentage of potassium ferrocyanide discharged from ordinary zinc precipitation boxes.

APPARATUS FOR TREATING ROCK ASPHALT.—No. 722,500; J. S. Downard and B. A. Roloson, Lima, Ohio.

Separator having tank, apron projecting out approximately horizontally from top thereof, conveyor moving over top of tank and apron, scrapers carried by conveyor moving therewith over tank and apron to skim asphalt from tank over apron, scrapers being formed of relatively stationary sections fastened to conveyor and yielding mounted on stationary sections.

DREDGING MACHINE.—No. 722,595; W. W. Lea, Iron River, Wis.

In dredging machine, combination with mechanism for alternately pulling scoop in opposite approximately horizontal directions, scoop provided with downwardly inclined legs whereby, under such alternating stress, it will be caused, by frictional contact with water, to descend in inclined forward direction under forward stress and to ascend in inclined rearward direction under rearward stress.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The Nome Gold Digger says much work is being done on Peluk creek this winter and there are more steam thawers within the radius of half a mile than any other part of the district. Five of the seven thawers there are in a direct line nearly parallel with the beach and about 1½ miles back. The best pay is found in strata of ruby sand varying in thickness, the formations indicating a beach deposit. This is thought to be the same beach that has been discovered on Hastings creek.

Superintendent Day of the Mansfield G. M. Co., on McGinnis creek, near Juneau, says he has had surveys made of their placer ground and lines run for the flume and pipe line that will be put in this spring.

Manager A. B. Iles of the Tanana M. & E. Co. will begin development work this spring on their copper prospects on Nebisina creek, a tributary of Nebisina river, at a point near the watershed between the two branches of the Tanana.

F. Hammond, superintendent of the Sheep Creek M. Co., reports fifty men at work on their mines. The company is putting in a heavier compressor. The mill has been crushing ore all winter.

T. H. Ellis, president of the Yellow Jacket M. Co., operating at Windham bay, near Juneau, says their mill capacity will be increased to eighty tons daily. Water power is used. The Yellow Jacket ore averages \$15 per ton, free milling. Mr. Ellis is also manager of the Detroit-Alaska M. Co., with placer diggings on Windfall creek, where he will put in 2000 feet of hydraulic pipe this spring. A sawmill has been installed and is sawing lumber for buildings and flumes.

ARIZONA.

The following companies were incorporated in this Territory last week, says the Bisbee Review: The Chloride G. M. Co. at Chloride, Mohave county; La Republica del Sur at Tucson; the Promontorio Con. M. Co. at Nogales; the International Investment Co. of El Paso, Texas, at Phoenix; the Gold Producers' Trust Co. at Phoenix; the Mexican Hydraulic G. M. Co., principal offices at Tombstone, Ariz., and Alta, Sonora, Mex.; the Lang Craig G. M. Co. of Phoenix, Ariz., and Milwaukee, Wis.; the Great Northern Oil Co. of Prescott, Ariz., and Detroit, Mich.

COCHISE COUNTY.

The Chicago group of claims, between the Uncle Sam and the White Tailed Deer groups, near Bisbee, has been sold to C. Chynoweth of Calumet, Mich., and the Wolverine & Arizona M. Co. formed with J. Daniel, president.

GILA COUNTY.

Superintendent A. C. Sleboth reports a strike of ore made last week in drift A on the 250-foot level of the Arizona & Hancock Co. mine, on the Mineral and Pinto creek divide, near Globe. The ore is chalcopyrite, assaying 20% copper, averages 30 inches in width and had been followed for 40 feet. Sinking has been resumed and the shaft will go down 200 feet more before another level is run.

D. M. McFarland and C. C. Clark have bonded the J. O. Hill gold mine, a mile west of Payson, for \$16,000. Development work will begin as soon as a steam pump and other necessary equipment can be installed.

The Pinto Creek Copper Co. has bonded the Chaparral group of mines at the head of Pinto creek, near Globe, for one year for \$35,000.

GRAHAM COUNTY.

(Special Correspondence).—The Gold Mountain mines, which have about 2500 feet of development, have on the dump 10,000 tons of ore estimated to average \$10 in gold per ton.

Globe, March 15.

The Johanna, near Metcalf, was sold last week to L. H. Mitchell. The claim adjoins some patented claims owned by Mitchell, upon which he is doing development work.

Leasing has been discontinued on the Arizona C. Co.'s Queen mine at Metcalf, and the company have men at work on the property under T. Shirley, superintendent. Ore shipments will be begun by May 1st.

The Shannon Copper Co., operating near Clifton, has resumed operations. The concentrating plant has a capacity of 500 tons daily. A pumping plant has been installed, says the Bisbee Review.

MOHAVE COUNTY.

At the Gold Roads camp, in the San

Francisco district, 23 miles from Kingman, the Gold Roads M. Co. have a gasoline hoist and air compressor set up at their shaft, says Superintendent C. A. Stevens; and they are installing a mill. The ore will be hoisted, handled by gravity through the crusher into the cars which will carry it to the mill, several hundred feet. Ore will be crushed at the mine to 30-mesh—at the mill, will be dried and run through rollers and crushed to 60-mesh, thence elevated and screened, taken to cyanide tanks, agitated and filtered. Power will be obtained from crude oil gas engines—seventeen being used in and around the plant.

PINAL COUNTY.

(Special Correspondence).—Globe promises to be a lively camp owing to development of the smaller properties. The new ones worthy of mention are the Copper Hill, adjoining the Old Dominion, and the Arizona-Boston Copper Co., which adjoins the United Globe. The latter is sinking two double-compartment shafts, one of which is in good ore at 150 feet.

Globe, March 12.

(Special Correspondence).—There is a well-defined anticline running about north and south in Riverside district, and in a shale formation dipping slightly to the east there is evidence of oil.

The Plural Paraffine Oil Co. has a well down about 1100 feet and has penetrated the formation down to the shale, which the well is now in. On reaching the shale they struck gas and a seepage of oil. They are making about 10 feet a day drilling. Several companies are in the field. The Sunshine Paraffine Oil Co., of which L. V. Navarro of Tucson is president, is about to put up a rig for operations.

There are reports of the Gila Valley, Globe & Northern Railroad extending from Globe to the Black Warrior Copper Co.'s mines. The Black Warrior is building an additional leaching tank of 300 tons and expects to start leaching about April 15.

The Troy mines at Troy have struck a body of ore the past week.

Globe, March 12.

(Special Correspondence).—J. P. Coplen, superintendent of the Pacific Mining & Metals Co., is with Kansas City men at their property in the Catalina Mountain district.

Globe, March 13.

The N. H. Melior gold claims in Saddle Mountain district, near Dudleyville, have been sold to G. B. Chittenden. He has also taken a bond on 600 acres of coal land in Deer Creek coal basin, near Dudleyville, and has men at work reopening an old prospect shaft down 80 feet, and will resume sinking.

SANTA CRUZ COUNTY.

G. W. Crowe, manager of the Arizona G. & C. Co., says they will install a 50-ton concentrating plant at Salero, 34 miles from Nogales. It will be erected at the Trenton mine, one of the group. The ores carry gold, silver and copper.

YAVAPAI COUNTY.

At the Val Minto mines, in Mint Valley section, 14 miles northwest of Prescott, seventeen men are at work, and grading is being done for a 10-stamp mill. At the 100-foot level on one of the claims a crosscut has opened up a ledge 14 feet wide, carrying values in gold.

L. Thomas, F. & F. Gibbons, owners of the Contention group of mines, near Del Pasco, Bradshaw mountains, southeast of Prescott, have installed a 5-stamp mill in Ash Basin, which is running on ore from the Contention. The Contention is the first south extension of the Old Reliable. A tunnel 665 feet in length, on the vein, cuts two shoots of ore, each 100 feet in length, averaging 18 inches wide and \$15 free gold per ton. There is a raise from the tunnel level to the surface 155 feet. A winze from the tunnel, 60 feet deep, shows 22 inches of milling ore. At Crowned King mine, in the same district, work is being done for installing a plant to work the tailings from the mill, which will have a capacity of 60 tons per day, and will save the zinc as well as gold contents of the tailings.

R. H. Palmer of Duluth, Minn., says development work will be resumed on their group 12 miles west of Frog Tanks, below and south of Castle creek. There is an incline shaft 150 feet deep, sunk on the vein, and considerable surface prospect work done.

C. C. Stuke reports having put the hoist in place on the Bodie mine, near Jerome, and has three shifts at work on development. He intends to sink the shaft to 500 feet and at the same time drift and crosscut from the present level.

It is reported the new shaft at the United Verde at Jerome will be sunk to such a depth, and from it new levels opened, as to make it practically the outlet of a new mine, thus avoiding the danger of another shut down should the fire in the older

workings take a fresh start, says the Jerome News.

E. D. Treadwell reports the Hackberry mine, near Mayer, has been unwatered, ten weeks being required to complete it. Ore is opened up on the 300 level.

CALIFORNIA.

AMADOR COUNTY.

The Ledger says there is an abundance of water for mining purposes around Volcano and hydraulic work is being done. Three claims are in operation, under Baron Bros., Gillick & Canvin and Marsino Bros. Superintendent J. Oldfield says he has men at work on the Two Channel mine.

The Dispatch says the Shenandoah M. Co. has opened up an 8-foot body of quartz, and it is proposed to install a mill. At the Edinburg mine, near Pine Grove, the hoist is completed and sinking resumed. They will go down 200 feet, says Superintendent D. Fisher.

BUTTE COUNTY.

The Big Butte M. Co., near Forest Ranch, will enlarge their flume and ditch, says the Chico Enterprise.

The Oroville Register says that the Cardella tracts of 57½ acres, near Oroville, have been bonded to Chicago men at the rate of \$3000 an acre. Work on the dredger to mine the lands will begin by October 1st. The Cardella tract is covered by an orange orchard.

CALAVERAS COUNTY.

The Continental mine, near West Point, closed down last week for a short time, says the Prospect.

Work will be resumed on the Parnell mine, near San Andreas, with H. S. Messer as superintendent.

The W. & W. Mobley mine, on the Welch ranch, near Milton, have installed a 5-stamp mill. The shaft is down 400 feet and an 8-foot vein of ore, averaging \$18 per ton, and carrying sulphurets, has been opened up.

The Angels Record says a pole line will be erected by the Standard Electric Co., from Angels to the Royal mine at Hodson to transmit power for the mill of the Royal Con. M. Co.

The Gwin mine is soon to introduce mechanical haulage in the lower levels of the mine, whereby it is expected to materially reduce the cost of underground transportation of ore and materials.

J. E. King has taken a working bond for one year for \$3000 on the Gold Standard and Louisiana quartz mines, on the Mokelumne river 1½ miles northeast of Mokelumne Hill and adjoining the Easy Bird mine. The working tunnel is being driven ahead and is showing a 5-foot vein of milling ore. At the Easy Bird, grading for a 10-stamp mill is in progress.

The Star of the East G. M. & M. Co., of Rich Gulch, has cut the eastern extension of the Iowa vein and is drifting for the pay shoot. As soon as this is reached a 200-foot upraise will be made and ore hocked out. The Star of the East has a working arrangement with the Iowa mine whereby they use the Iowa tunnel, a saving of 400 feet of crosscut tunnel. The Iowa as well as the Star of the East mines propose the erection of a mill, says the Chronicle.

EL DORADO COUNTY.

At the Karolyi mine, near Kelsey, the whim is in operation and the shaft is being sunk at the rate of 2 feet per day.

At the Levitt Con. mine, near Kelsey, the power plant and compressor are in operation and the main tunnel will resume driving to the vein.

The Patrick-Schulze ditch, near Placerville, is completed around Mt. Murphy, and the mine is in operation.

FRESNO COUNTY.

The El Zumo Puro Oil Co. struck oil in their second well last week, near Coalinga. J. Outler is superintendent.

The Standard Oil Co. is laying a pipe line from the Coalinga field which will connect with their line from Bakersfield to Point Richmond at Mendota.

HUMBOLDT COUNTY.

The Orleans Bar G. M. Co. are working their group of placer mines near Orleans.

INYO COUNTY.

(Special Correspondence).—The Troeger Bros. have six men at work on the Morning Star (Dumphy mine). A gasoline hoist was placed at the end of a 400-foot crosscut tunnel, 250 feet below the surface, and the winze deepened from 100 to 225 feet, the depth of the proposed lower crosscut tunnel which will be driven 700 feet to connect, and will cut the entire Cerro Gordo mineral zone. In sinking, a blind shale contact and an 8-foot vein carrying values in gold and silver were encountered. Double shifts are drifting at bottom to reach the high-grade ore extend-

ing down from upper workings. No ore is being stopped or shipped, it being the intention of the owners to develop the property before building a reduction plant.

T. C. Boland has a 10-horse team hauling lumber and machinery from Keeler to Cerro Gordo for a concentrating plant to work the slag and mine dumps of the old Union property, and is also putting the pumping plant and pipe line which supplies water to Cerro Gordo in repair.

P. Clinton has two carloads of good-grade ore sacked and will ship soon.

There is still considerable snow in Cerro Gordo.

E. R. Hamilton is driving his crosscut tunnel to tap a large ledge, 350 feet deep, from which shipments of high-grade ore were made in the early days.

Cerro Gordo, March 13.

The 8-stamp mill of the Cecil R. M. Co., near Ballarat, is in operation and crushing ore from the Santa Rosa mine.

KERN COUNTY.

At the Buckboard mine, near Randsburg, C. Adams, superintendent, says he has men at work drifting on the 150 and 200-foot levels.

Spangler Bros. are hauling ore to the Phoenix mill from their mine near Garden Station.

The Baltic 10-stamp mill in the Stringer district, near Randsburg, has been running continuously since it was installed in November, 1902, excepting for the monthly cleanup periods, says Superintendent W. H. Wynn. The main shaft is down 225 feet, with a 50-foot ledge. Three levels are being worked and twelve men are employed—single shift.

At Kern river, near Bakersfield, the Mecca Oil Co., which has had four wells idle for a year past, is putting them on the pump again, says the Reporter.

The Aladin Oil Co., near Bakersfield, is finishing its No. 3 and is building the rig for No. 4. This company will drill twelve new wells, and is pumping those wells already completed.

The Clairemont (Union Oil Co.), near Bakersfield, is erecting rigs for four additional wells, making eleven in all.

LASSEN COUNTY.

The labor difficulties at the Golden Eagle mine of the Hayden Hill M. Co. are reported to have been amicably adjusted and work resumed.

LOS ANGELES COUNTY.

The Home Oil Co., near Whittier, has finished No. 1 well and began pumping it last week.

MADERA COUNTY.

(Special Correspondence).—The Texas Flat M. Co. have bought of the Westinghouse Electric & Mfg. Co. one 75 K.W., 2200-volt, three-phase, 60 cycle, A. C. generator, 720 R. P. M.; one 187 K.W., 125-volt, D. C., M. P. exciter, 1800 R. P. M.; one type "8" switchboard panel; one 40 H. P., type "C," three-phase, 400-volt induction motor, 850 R. P. M.; one 20 H. P., type "C," three-phase, 400-volt induction motor, 1120 R. P. M.; one 10 H. P., type "C," three-phase, 400-volt induction motor, 1120 R. P. M.; three 30 K.W., O. D. type, oil insulated, self cooling, lowering transformers, converting from 2100 volts to approximately 420 volts; one 3 K.W., O. D. transformer for lighting circuit, converting from 2100 volts to approximately 105 volts, and the various accompanying details of electrical equipment. The generator will be installed about 3 miles from the mine and will furnish the power necessary to operate a 20-stamp quartz mill, with rock breaker, concentrators, etc., and will also run two hoists.

Madera, March 15.

SANTA BARBARA COUNTY.

J. B. Treadwell has bought 200 acres on the Casimira ranch, near Casimira, and will begin development work for oil.

SANTA CLARA COUNTY.

The Alherta Oil Co., having a lease on a portion of the Sargent tract, near Sargents, has erected a derrick and has begun drilling.

SHASTA COUNTY.

The Texas mine in Old Diggings district, near Redding, is temporarily closed down due to the gearing on the electric hoist breaking. Shipments of their gold quartz ore to Keswick were being made.

The Courler says it is reported the Spanish mine, near Shasta, will be started up in April. There are hoisting works and a 10-stamp mill on the property.

Dredging operations were begun this week on the Wynn placer at Horsetown, on Clear creek, being operated by electricity. The company has options on several farms adjoining the Wynn and expects to plow them up for the gold the soil contains.

SISKIYOU COUNTY.

Superintendent C. W. Tyrer of the Tyrer mine, near Hornbrook, says he will

resume operations at both mine and mill this week.

The Jillson mill, near Yreka, has resumed crushing ore and seventy men are at work in the mine and mill.

The Commodore mine, at Barkhouse creek, will be opened up by Milwaukee men, says the News.

The shaft house of the Morrison & Carlock mine, in Quartz valley, near Fort Jones, was destroyed by fire last week.

SISKIYOU COUNTY.

The Deadwood Placer M. Co., 14 miles west of Yreka, has a bank of gravel 18 feet deep opened by a 40-foot breast. There are 2000 inches of water available under 250 feet head. It is intended to hydraulic the coming season. Superintendent C. W. Knox states that the gravel pans from surface to bedrock. Seven men are employed at present.

Brokaw & McLean are running their hydraulic mine in Quartz valley, with an abundant supply of water at present, operating the giants and elevators. Their quartz mill in Hull gulch will be started up next week as soon as their air compressor is repaired.

TRINITY COUNTY.

(Special Correspondence).—At the Dorleska mine, there has been no interruption of work during the winter, either in the mine or mill. The vertical, double-compartment shaft has been sunk 120 feet additional, and the fourth level has been started at a depth of 300 feet from the surface. The mill has made a regular output of bullion, and the new battery of five stamps has been set up and will be started next week, after which the mill will have a capacity of twenty tons per day. The Dorleska vein continues to look well, and on the third level varies in width from 4 to 14 feet.

Trinity Center, March 18.

The Yellow Rose of Texas mine, near Trinity Center, near the headwaters of Coffee creek, and adjoining the Dorleska mine on the south, has been bonded to the J. J. Chambers Co. of Redding. A 1000-foot tunnel will be driven to cut the ledge at a depth of 350 feet below the present workings. The mill and hoisting plant will be enlarged. The property consists of eleven locations and millsite, embracing 220 acres and 640 acres of patented land.

TUOLUMNE COUNTY.

Manager M. B. Kerr, the Jumper Gold Syndicate of California, Ltd., operating at Stent, says the reports to the effect that operations at the Jumper mine had suspended are untrue. The Golden Rule is closed down pending the connection (200 feet yet to run) of the two mines by the drift on the 500-foot level of the Jumper, and the addition of forty stamps to the Jumper mill to handle the ore from the Golden Rule. The Jumper is running full banded, and sixty stamps are dropping in the mill. The local California organization has been discontinued, and its property transferred to the above named company whose head office is in Glasgow, Scotland.

D. Wiget has bought the Hold Fast mine, 1½ miles from Jacksonville.

The Rose Creek M. Co. has deeded to E. A. and J. O. Hayes of Santa Clara, Cal., the Star mine and its other holdings east of Columbia.

E. A. Thissell of Lowell, Mass., has bought the Starr King and the Sherman quartz mines, near the North Fork of the Tuolumne river, 3 miles from Carters. C. A. Holland is superintendent.

The Grizzly mill resumed last week and twenty stamps are dropping on ore from the shoot opened up last month, says Superintendent W. R. Hall.

It is reported that the Starr King mine, 3 miles southwest of Carters, will be reopened, with C. A. Holland superintendent.

At the Norwegian mine, near Tuttle-town, fifteen men are at work and the 10-stamp mill is running.

Superintendent F. Chappellott of the Mohican mine, near Groveland, has thirty-five men at work.

At the Pinon Blanco mine (the Ward), on the Mother Lode, 3 miles from Coulterville, at 600 feet in the tunnel last week a ledge of free-milling gold ore was struck from the hanging-wall side, says Superintendent W. T. Stephens.

At the McAlpine mine of the McAlpine G. M. & M. Co., near Big Oak Flat, the two-compartment shaft is being sunk from the 300-foot point to 500 feet, at which point they will crosscut to the vein, says Superintendent S. E. Rigg. A fine gallows-frame has been erected and a hoist will be put in.

YUBA COUNTY.

The Shakespeare, Byron and Milton quartz claims in New York township, near Woodleaf, have been sold to C. J. Nickerson. Work will be resumed this month and machinery installed.

COLORADO.

The mineral output of Colorado for the year 1902 is placed by H. A. Lee, State Commissioner of Mines, at \$44,708,895.83. There are thirty-nine counties enumerated. The metals produced were gold, silver, lead, copper and zinc. The gold output reached \$28,577,117.40. The counties producing over \$500,000 each were: Boulder \$538,701.54, Clear Creek \$930,480.72, Gilpin \$1,551,035.46, Lake \$1,203,924.15, Ouray \$2,420,725.71, San Juan \$1,524,226.47, San Miguel \$2,007,656.43, and Teller \$16,931,892.51. The silver output was valued at \$8,315,192.29. The principal counties producing silver were: Clear Creek \$687,152.48, Lake \$2,942,792.61, Mineral \$1,003,544.32, Ouray \$411,988.37, Pitkin \$1,597,895.52, San Juan \$437,154, San Miguel \$551,143.42. The lead production was \$4,325,484.29, and the principal producers were: Hinsdale \$252,838.02, Lake \$1,605,227.74, Mineral \$378,065.36, Pitkin \$1,016,184.37, and San Juan \$313,308.24. The copper production reached \$1,006,108.31. The two largest producers were Lake county, \$310,359.42, and San Juan, \$358,070.08. Zinc was produced to the value of \$2,544,993.48. Lake county was the chief producer of this metal, outputting 47,637,490 pounds, valued at \$2,305,654.62.

The News says the Denver office of the American S. & R. Co. has authorized its agents to announce that the price paid at smelters for lead in ores will be \$3.75 per 100 pounds, being an advance of 25 cents per hundred over the smelter rate for 1902.

BOULDER COUNTY.

The Mile High M. & M. Co. of Denver has bought the Caryl group, near Sugar Loaf.

The Northern Coal & Coke Co. started last week to drill near the Acme mine, south of Louisville, to test the second vein of coal before putting down a new shaft. The company will begin work on the new shaft April 1.

The Fox & Patterson mine, on the Harper place, west of Louisville, is down 200 feet, and expects to strike the coal at 225 feet deep.

CHAFFEE COUNTY.

Manager T. E. Ritnour of the Cleopatra mine, east of Cameron mountain, near Whitehorn, says he will put in a hoist, air compressor, pumps and boilers. A drift is being run in at a depth of 100 feet to make air connections with an old working shaft.

CLEAR CREEK COUNTY.

In the annual report sent out by the Kelly Tunnel Co., operating at Georgetown, are shown the expenses itemized as follows:

For mining claims.....	\$19,524.54
For labor and superintendence..	23,689.24
For tools and mining supplies...	15,953.82
For plant, machinery and supplies.....	23,639.52
For real estate.....	765.03
For office fixtures and furniture..	282.24
For accounts payable.....	4,024.62
For taxes, commission and expense.....	8,976.43
For accounts receivable.....	139.87
Total.....	\$86,995.31

During the year the tunnel was driven 63 feet by hand before the machine drills were put on. Power was installed May 17. The total distance for the year was 1629 feet. The average per month for machine work after July 1 was 221 feet. The best run was in November, when 260 feet were broken down. The cost per foot, average, is estimated at \$23.31.

The East Red Elephant Co. at Lawson have begun work on their tunnel, which is to tap Red Elephant and other veins in Red Elephant mountain.

The Freeland Extension Co., near Idaho Springs, has resumed operations after a shut-down pending the installation of an air compressor. Manager Wilson says the company will drive the levels ahead in the part of the group, connecting with the Freeland, while in the older workings the stopes will be released in blocks. All of the levels of the Freeland mine to a depth of 900 feet were driven up to the end lines of the Extension and a perpetual right of way given to operate through the Freeland adits.

The Gomer M. Co., operating on Spring gulch, near Idaho Springs, are putting up a hoist. Sinking on the extension of the Fraction and Kitty Clyde vein will begin.

W. E. Renshaw, manager of the Gem Con. Co., near Idaho Springs, says work will resume on the Gem vein through the Newhouse tunnel.

The Donaldson Mountain G. M. Co. mines have been sold for \$185,000 to W. M. Phillips and A. T. Lucas of Chicago, Ill. The group covers the ground between the Coronation and Centurion groups on Donaldson mountain, near Idaho Springs, and comprises forty claims. The new owners will begin development work next week,

continuing the Golden Hill tunnel, which is in 300 feet, to its terminus, 2700 feet distant. The bore will cut the Champaign, Freeland and other veins. The greatest depth attained in the tunnel is 1300 feet.

Experiments are being conducted by the managers of the Gold Dirt, Gold Fissure and Republic groups of mines at Empire, to determine the value of electric drills as a factor in mine development in this locality, says the Record.

CUSTER COUNTY.

G. W. Avery, having a lease on the Elematah claim of the Aburdix G. M. Co., near Custer, has struck at a depth of 160 feet a 12 inch vein of ore that runs \$500 per ton in gold and silver, with some copper. The shaft, which is 400 feet deep, is being unwatered.

DOLORES COUNTY.

The Geyser mine, 1½ mile below Dunton, will be developed on a larger scale and output increased, says W. S. Evans of Milwaukee, Minn., part owner. A mill will be installed. L. Gilligan of Dunton is manager.

The mill of the Mt. Goram M. Co. at Dunton resumed operations last week.

The 50-stamp mill at Ophir Loop of the Ophir Con. M. Co., W. S. Buckley general manager, is treating an average of 150 tons of ore per day. The ore, coming from the Ida and Verdict veins, is free milling gold, the balance of the output being from the Silver Bell and Butler veins, which carry 5 feet of concentrating material, which returns values in gold, silver and lead at the smelters. One carload of concentrates is sent out daily.

FREMONT COUNTY.

The Rocky Mountain S. Co., whose works are in Florence, on the Arkansas river, has made an assignment for the benefit of its creditors.

GILPIN COUNTY.

The Progressive M. & I. Co. has a lease and bond on the West Wyandotte group, in Leavenworth gulch, on the south slope of Quartz hill, near Central City. The main working shaft of the group is the West Wyandotte, down 600 feet, and has 200 feet of water in it. Pumping operations will begin next week, says W. L. Cooper of Denver, vice-president of the company.

The Freedom mine, on Winnebago hill, near Central City, is being operated by the Colorado Tellurium G. M. Co., of Paterson, N. J., men, under lease and bond. Machinery has been installed to sink the shaft to 1500 feet, and the workings are being unwatered. R. Borchardt is superintendent and manager.

The Maine property, southeast of Central City, is being reopened by the Sydenham M., M. & L. Co. under lease and bond. S. W. Brereton of Denver is superintendent.

The Pittsburg Con. M. & M. Co., J. R. Anderson president, has bought for \$100,000 the Gold Dirt group at Perigo, 2 miles from Rollinsville.

GUNNISON COUNTY.

C. W. Swanson of Denver, superintendent of the Rustler G. M. & M. Co., operating on Rustler mountain, near Crested Butte, says they will have a mill in operation early in the spring at Gothic. A 100-foot contract will be finished by April 1, making the Howard tunnel 500 feet deep. The last assay of ore from this tunnel shows values in gold, copper and silver. This company is made up of Illinois men.

It is reported work will be resumed on the Midland mine, near Vulcan, and a tunnel is to be run from Beaver creek, in under the present shaft. The Midland is showing milling ore beside some high-grade material. The operators say the body of low-grade ore will warrant the erection of a cyanide plant.

At the Good Hope mine at Vulcan they are shipping ore from the 500-foot level which returns \$6000 per car, says L. Weiss of Del Norte, principal owner. The ore is a schist, carrying copper, telluride of copper, with himself and gold. The shaft is to be sunk to the 700-foot point.

LAKE COUNTY.

The Sharp G. M. Co., operating on placer ground at the western rim of Leadville basin, near Leadville, struck blue lime last week in a drift 50 feet from the surface, and it was found to be pitching toward the east at a sharp angle, says Manager Sharp.

Manager Dean of the Valley M. Co. says operations will be resumed at the Valley mine, near Leadville.

The Uintah placer, in lower California gulch, near Leadville, will be worked next summer. The territory extends from the lower part of Stringtown down to Malta. I. B. Porter of Denver is manager.

PARK COUNTY.

The Damascus M. & M. Co. have bought eight claims (eighty acres) on Loveland mountain, above Alma, and will begin op-

erations this month. The group lies between the Fanny-Barrett and Kansas Con. mines. They also own ground adjoining the Little Johnny mine. P. A. Phillips is superintendent.

SAN JUAN COUNTY.

The Gold Tunnel & Railway Co. (the Highland Mary properties) in Cunningham gulch, near Silverton, will begin ore shipments next month. At present thirty men are employed on development work. The main tunnel is being driven ahead, and is in 6100 feet. At 1000 feet from the breast a raise is being made which will be 450 feet and will connect with a crosscut being run from the Blowout. It will take about 700 feet more to complete this work, when this improvement will provide ventilation for all parts of the mine, besides being used for transporting ores. No ventilation in this tunnel caused them to close down all work upon their ore bodies until these connections are made. A mill of 100 tons capacity is ready for operation. Electric lights are furnished from a plant at the mill. C. W. Everett of Toledo, O., is president of the company. The Anglo-Saxon crosscut, up Cement creek, is in 2100 feet and is being driven under Superintendent W. Grossklau.

The tunnel on the Waterfall claim, in Needle Mountain district, near Silverton, is in 325 feet, and is showing 2 feet of ore that assays \$15 in gold and thirty ounces silver. The ore can be successfully treated by the cyanide process, and it is the intention of the management to put in a mill this spring.

The Yuba Bill group of mines, near Eureka, have been sold for \$60,000 to A. W. Hall and F. Jones of Waterville, Me., who hold the title to the property for the use and benefit of the Stony Gulch M. Co. This group is in the Eureka district, on Bonita mountain, adjoining the Gold King Con. group. Work will begin April 1.

The Big Trippe crosscut tunnel at Howardsville is going ahead at 1½ feet per shift of eight hours. This tunnel, which is 6x8 feet in the clear, is being run to cut the Charter Oak group on King Solomon mountain at a depth of 500 feet. G. D. Cook is superintendent.

Work will be resumed on the properties formerly owned by the Eclipse M. & S. Co. near Animas forks, near Silverton, on Mineral and Temptation mountains. The veins are from 4 to 7 feet wide, except in the Eclipse, which is 60 feet wide, with a pay streak 4 feet wide, containing galena in a quartz gangue, with milling values in silver and gold. In connection with these claims are two millsites, near the Animas river, with ample water supply for milling purposes. A crosscut will be run to cut the Eclipse vein in a new place to further test the extent of the ore bodies and to see if it will justify building a mill.

SAN MIGUEL COUNTY.

I. B. Innes of Saw Plt is working on a group on the edge of the district. He has driven three levels on the vein and the lower one is in 330 feet. The ore averages \$20 per ton in gold and silver, according to mill test. It is proposed to install a mill and tramway this spring.

SUMMIT COUNTY.

Manager Berlin of the Hamilton mine, near Breckenridge, says he will double the size of their 10-stamp mill.

On the east side of Gibson hill, near Breckenridge, the Providence & Colorado Co., H. S. Whitehead manager, sinking a shaft on the Teller lode, are using a whim for hoisting. Last week, at 120 feet, a body of gold-lead ore was struck. A flow of water is bothering, which will require the placing of a steam pumping and hoisting plant.

TELLER COUNTY.

At the Hawkeye, at the head of Bernard creek, between Cripple Creek and Gillett, an air pipe line is being laid from the Lincoln mine and development work will begin next week.

The Horseshoe, Londonderry, Fairview, High Tide and Bertha lodes of the Bull Hill Con. Co., on Bull Hill, Cripple Creek, have been sold to the United Mines Co.

The C. K. & N. property, at Cripple Creek, has been closed down temporarily, owing to the water situation. The lessee is baling out the mine and will install pumps if the flow does not prove too heavy. The present difficulty is supposed to be caused by the setback from the El Paso mine. Pumping operations are practically suspended throughout the entire district, and with the exception of the Vindicator and Stratton's Independence all pumps are standing idle and waiting for the drainage tunnel to tap the water course. There are quite a number of mines forced to handle a small amount of water that accumulates during the twenty-four hours, but the only pumping to speak of is being done by the two mines mentioned. At the Vindicator, during the month of February, they raised 18,462,000 gallons of water. In this case the company makes a profit off the water, as they sell a

portion of it to the city of Victor for domestic purposes. The El Paso Con. Co. is pushing the work of bulkheading and will suspend all pumping and permit the water to rise and flow out of the Standard tunnel level. Bulkheading in the bottom level, where the men are at work in driving the drainage tunnel, forces the water to rise up through the vein, principally the C. K. & N., until it reaches the tunnel, where it will flow out and down the creek. The Gold King is pumping a few hours each day.

The Gould Con. Co. recently granted a lease on the Rhinoceros and Nil Desperandum claims on Raven hill, near Cripple Creek, to the Pueblo & Cripple Creek Railway Co., operating the Ophella tunnel, which is expected to reach this ground by April 1. It is the intention of the lessees to explore the group from the tunnel level, which is 800 feet below the surface. The greatest depth to be attained by the tunnel will be 1500 feet.

The Cripple Creek Times says the pay roll of February for the mines and mills of Cripple Creek district, which was distributed on the 10th inst., showed an increase over January. There was a total of 6286 men employed, receiving an aggregate of \$654,778.21.

The Golden Cycle Co. at Cripple Creek has granted a lease on the Dalzell and Wilson workings of the Anna J. claim to McGarry & Huxley, who will begin operations next week. The lease extends from the surface down to 300 feet.

The Portland mine, at Victor, is temporarily closed down pending repairs. On the 10th inst. an unknown accident caused the hoisting engine at No. 2 shaft to "run away," wrecking the head frame; the flywheel went to pieces; the up-coming cage dropped back into the shaft, followed by 2200 feet of cable, but jammed at the 300-foot level.

IDAHO.

BANNOCK COUNTY.

Manager W. Beddlg says he is making the preliminary survey of the ground at Pocatello on which his company will install a smelter and refinery of 150 tons daily capacity. The company is composed of Pittsburgh men.

BOISE COUNTY.

The Idaho-Colorado G. M. Co., Ltd., has been incorporated at Idaho City; M. Gee, H. L. Fisher, J. A. Fuhs, W. H. Yankee, W. S. Herring and J. A. Hinebaugh. The company owns a group of claims in Neal district, adjoining the Overlook group, and is operating a group of claims in Pearl district. It is the intention to extend operations to Basin properties during the coming season.

The Chile mill at the Overlook group of mines at Neal is in operation. It has a capacity of 125 tons per day.

The Elkton group of quartz claims, near Neal, has been bonded to the Overlook Co. for \$25,000. Work will begin this spring.

ELMORE COUNTY.

The General Pettit mine, near Atlanta City, has been sold to E. Holter of New York for \$130,000.

IDAHO COUNTY.

But for the shortage of powder there would have been a larger amount of development work done in Thunder Mountain district this season, says B. F. Goldman in the Intermountain. About seventy-five men are at work for wages, besides those working their own properties.—The Gold Reef Co., 5 miles above Roosevelt, on Monumental creek, has crosscut its vein for 120 feet. Several men are at work there on two shifts.—The Dewey mill has resumed.—The Sunny-side tunnel is in 140 feet.—The Glasgow and Dundee group, on Profile creek, has been bonded to Joplin, Mo., parties. It is expected that the company will put in a road from Warren this year and install a reduction plant.

G. J. Wright and W. A. Scott, operating the Kimberley and Jewell groups of gold mines on Bear creek, near Weiser, say that next week they will have thirty-five men at work and extensive development begun. A 10-stamp mill will be installed.

It is reported that C. J. Perkins of Cripple Creek, Colo., has bought the Sunshine group and the Climax claim, adjoining the Fairview mine, in the Thunder Mountain district, near Roosevelt. Perkins intends to install a 20-stamp mill.

SHOSHONE COUNTY.

J. Goodrich, resident manager of the Highland Chief, on Pine creek, southwest of Wardner, reports the pay streak opened up 8 feet wide, with the entire vein 18 feet wide; assays gave \$20 gold, nine ounces silver, 15% lead and a trace of zinc. He says a concentrator will be erected in the summer.

A 3-foot body of milling galena has been struck on the Nine Mile mine, 3 miles

north of Wallace. The company ran a crosscut tunnel and tapped the ledge at 2000 feet, from which point they drifted on the lead and the chute was cut at 400 feet.

The crosscut on the Little Chief silver-lead mine, at Mullan, is in 500 feet, and they expect to cut their vein this week.

LOUISIANA.

LAFAYETTE COUNTY.

An oil gusher was brought in at Anso la Butte on the 6th inst. by Heywood Brothers. This well had been abandoned at first, and the drillers resumed on finding 300 feet of oil in it. The gusher is 5 miles from Lafayette.

MICHIGAN.

HOUGHTON COUNTY.

Superintendent J. Stanton says the Winona Co. owns 1568 acres of mineral lands near Winona which contains about a mile of the Winona amygdaloid, which runs about 12 feet wide. The Winona Co. received \$13,000 for their copper for the month of December, which more than paid expenses. They are sending an average of five 40-ton cars of rock per month to the Atlantic mill, yielding twenty-three pounds of ingot copper per ton; and would send more, but the Copper Range Railroad cannot furnish the equipment.

It is reported the Calumet & Hecla, at Calumet, will close down five of its old heads on arrival of the first boat in the spring and will begin remodeling them at once, not waiting for the heads in the new mill to get in full running order.

President Paine of the Copper Range Con. Co. says they will build an addition to the Champion mill this coming summer to hold two heads. The intake tunnel has been built 30 feet east of the present mill to provide water for the extension. F. I. Cairns, formerly at the Washoe smelter, Anaconda, Mont., has charge of the building of the new Copper Range smelter. The Copper Range track has been completed to Calumet.

Superintendent Hosking of the Franklin Jr. mine, near Houghton, says operations on the amygdaloid lode have been discontinued and work transferred to the conglomerate lode, on which one shaft is down 1600 feet and drifting and crosscutting done. The rock being taken out from this shaft averages 11% mineral containing 63% fine copper. The lode is 20 feet wide. The management has decided to sink a new shaft 1200 feet south of this one. The Franklin Jr. and the Franklin are together shipping 1000 tons of rock daily to the mill, and with the addition of another head of stamps, which will be put in this spring, the production can be increased.

ONTONAGON COUNTY.

Superintendent J. M. Wilcox of the Mass mine at Mass City, in his annual report says the larger part of the new ground has been opened west of B shaft, and 75% of the rock stamped has come from that point, the larger amount of work being done on the Evergreen lode. The two shoots of copper ground, running from A shaft on the west side, continue to show as good values at the bottom as they did at the sixth level. The width of the shoot is 300 feet. No work has been done on the east side of A shaft. C shaft has been sunk 438 feet on the Butler lode, giving three levels. Drifts are being run east and west on the third level and a crosscut north to the Knowlton lode on the same level. Rock hoisted during the year, 203,769 tons; rock stamped, 152,562 tons, and mineral obtained, 3,273,835 pounds. Total number of new openings during year, 4740 feet.

MONTANA.

BEAVERHEAD COUNTY.

A strike of a 6-foot body of gold ore is reported made at the French Bros' mine at Argenta, 13 miles east of Dillon. The strike was made on the 150-foot level. The mine is owned by G. & T. French.

GRANITE COUNTY.

The Joseph Case group (the Fisher Jack mine), on lower Rock creek, near Phillipsburg, was last week bonded to B. H. Dunshie et al. of Butte.

LEWIS AND CLARKE COUNTY.

In the Blue Cloud district, near Marysville, the Eglene Placer Co. is working three drifts on the bedrock drain from the mouth of Lincoln gulch with twenty-five men. The company also has men getting out timbers for the drain and flumes. It is expected that the drain will be 4000 feet in length before pay gravel is reached.

MADISON COUNTY.

L. D. McCall of the Bismarck Nugget G. M. Co. says they are installing hoisting and other machinery on their mine near Twin Bridges.

MISSOULA COUNTY.

The Tarbox M. Co. is making arrangements for the construction of a 250-ton concentrating mill at the Tarbox mine, near Saltese.

PARK COUNTY.

The Kimberly-Montana G. M. Co. will increase development on their properties in Bear Gulch district, near Jardine. A 60-stamp mill is being built and a 40 stamp mill has been completed. H. D. Andrews of Salt Lake City, Utah, is manager. The Kimberly-Montana Co. is the result of the reorganization of the Bear Gulch M. Co. and the Gold King M. Co. P. L. Kimberly of Chicago is president.

POWELL COUNTY.

T. Hird of Blackfoot City says he is running a tunnel on the Butterfly group of mines, between Carpenter and Basin gulches, 8 miles north of Avon station, on the Northern Pacific Railroad. The Butterfly lead is 40 feet in width and the tunnel is in 225 feet. The ore carries copper pyrites and copper glance, with values in gold, silver and copper. A shipment of ore from the Loraine claim, on the Butterfly lead, carried 30% copper, \$5 per ton in gold and 20 ounces silver.

NEVADA.

ELKO COUNTY.

A 60-stamp quartz mill will be installed on the Nelson group at Mountain City, says Manager Purdum, part owner, with other Eastern men.

The Riddo mines at Edgemont, recently sold to R. W. Purdum of Nampa and H. Russell of Pittsburg, Pa., who have organized a company, are being operated, with L. Bishop as superintendent, and a stamp mill will be installed.

ESMERALDA COUNTY.

The Douglas M. & S. Co. at Douglas has eighteen men at work and the face of the tunnel is in 300 feet, says the Journal.

(Special Correspondence)—The Klondike mining district, 12 miles south of Tonopah, is the center of a field which is being carefully prospected.

From East Klondike may be seen Gold mountain, 6 miles south of Tonopah; Lone mountain, where Lynch & O'Meara are shipping ore; Montezuma, a silver-lead camp; Grandpa, a newly discovered property, and the Blair gold mines of Silver Peak.

Several cars of ore shipped from East Klondike to the Selby smelter averaged 800 ounces silver per ton.

About \$50,000 worth of ore has been shipped from South Klondike, mostly by leasers on 25% royalty. Several small shipments have been made from other properties in this district, but as yet there has been but little development. The formation is lime, shale, quartzite and granite, cut by numerous porphyry dykes. The mines at East Klondike are at contact of the lime-shale and quartzite, those of South Klondike paralleling the granite. The ore is brittle silver, with chlorides and bromides of silver, also galena and carbonate of lead carrying gold and silver.

Several thousand dollars in coarse placer gold have been obtained here by dry washers.

Klondike, Nev., March 14.

LANDER COUNTY.

The Boston & Maine G. M. Co. was incorporated at Salt Lake City, Utah, by W. A. Eckman, C. S. Richardson, C. F. Adams, G. F. Putnam and L. Dunham. They will operate a group of mines 3 miles south of Galena, in Battle Mountain mining district.

LINCOLN COUNTY.

E. B. Scott has bought the Rose Howard-O'Connor interests in the John Flynn group at Newberry mountain, near Searchlight.

The cyanide plant of the Quartette M. Co., near Searchlight, is in operation, says Superintendent Harrington. Two gasoline engines are being installed—one at mine, and one at mill.

Manager W. T. Mitchell has begun operations on the DeLamar Extension G. M. Co.'s group, near DeLamar.

Hoisting was begun at the Mendha mine, near Pioche, last week. Electric drills are being used.

NYE COUNTY.

The Los Angeles, Daggett & Tonopah R. R. Co., with \$7,000,000 capital, has been organized at Los Angeles, Cal., to build a railroad from Daggett on the Santa Fe railroad in San Bernardino county, Cal., to Tonopah. The line of the road will follow closely the old emigrant road northwesterly to Death Valley and thence northward to Tonopah.

The Tonopah M., M. & D. Co. has incorporated at Butler, to construct a mill for the treatment of Tonopah ores; J. L. Butler, Brougher Bros., H. C. Cutting, F.

Golden, W. Douglass, G. Nixon, Crocker & Salsberry and C. E. Knox. A mill will be installed on ground owned by the Midway M. Co.

Superintendent Patrick of the Tonopah Syndicate G. M. Co. at Butler says development work is progressing on this group, which includes three claims and a fraction adjoining the California-Tonopah on the west. The shaft is down 60 feet and a hoisting plant of sufficient capacity to sink to 500 feet will be installed.

The Tule River Placer M. Co. was incorporated at Butler last week. Water to hydraulic the ground will be piped a distance of 16 miles.

At 400 feet northeast of the present breast of the drift, and directly on the course of the vein, the Con. Nevada Co., adjoining the Wedekind, near Reno, is sinking its Anna Belle shaft to intersect the vein on its dip.

The Desert King, of the Wedekind-Desert King group, owned by J. Sparks, is maintaining its output of high-grade ores, which, owing to its value, cannot be profitably treated at the Sparks mill.

At the Molly shaft of the Mizpah mine at Butler a 12 H. P. gasoline hoist was put up last week. The shaft is down 150 feet.

The Tonopah Miner says, through concessions on both sides, the Belmont Development Co. has secured from the Tonopah Co. the right to use the Desert Queen shaft for the development of the Belmont group. A contract has been let to sink that shaft 200 feet below the 614-foot level. A crosscut is being run from the 614 level into the Silver State. The Belmont shaft, on the Belmont claim, 2000 feet east of the Desert Queen shaft, is down 350 feet. A 44 H. P. gasoline hoist is being installed on the Belmont.

STOREY COUNTY.

Manager J. Ryan says 1550 feet of No. 6 three-conductor armored cable will be put in the Union shaft at Virginia City, for transmitting electrical power from the surface to all of the underground workings in the Sierra Nevada. Three 10 K. W. power transformers and two 7½ K. W. light transformers will be installed as soon as the wiring can be done.

OREGON.

BAKER COUNTY.

Mill operations at the Psyche, in the Greenhorn mountains near Sumpter, have been temporarily suspended because of a wood shortage. Development work continues in the mine.

The Standard, Copper Ridge and Willie Boy groups of mines at Quartzburg, near Sumpter, have been consolidated and organized as the Standard Con. M. Co.; with D. L. Killen, E. W. Mueller, C. B. Wade, Z. Houser. A reduction plant will be installed and further development work done. There are twenty-six claims in the merged property, covering Copper mountain, on Dixie creek, a fork of the John Day. The Standard produces cobalt ores.

J. G. English of Danville, Ill., part owner in the Amazon group of mines, near Sumpter, says development work will be continued on the group this season.

The Pacific G. M. Co. of Boston has been organized to develop the Kentucky group of mining claims in the Bonanza district, near Sumpter. They are in the Westfall basin, near the Bonanza mine. W. E. Hurd is manager.

JOSEPHINE COUNTY.

The Oro Fino quartz mine, in Jump-off-Joe district, near Merlin, is to be opened up this spring and a mill installed in the summer, says Manager Chase, of Portland. The Oro Fino has two veins, parallel, and 40 feet apart, and a tunnel, 600 feet in length, taps one at a depth of 125 feet from the surface. A crosscut from this will be run to cut the parallel vein which was the one worked at the surface.

The Golden Drift M. Co. has moved its sawmill near the dam being built by it across the Rogue river, at the Dry Diggings, near Grant's Pass. The dam will be finished next month after which machinery will be installed in time for the beginning of the fall season. This winter the company has had two giants at work in the diggings, using water from Jones creek.

PENNSYLVANIA.

YORK COUNTY.

A find of iron ore is reported in the river hills near Wrightsville. The ore is hematite containing little gangue.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Tinton M. Co. has been organized in Chicago, Ill., to develop a series of veins of tin ore at Tinton, in the western part of the county, near Bear gulch; W. H. and E. W. Noakes, P. B. Weare, with C. Walte as manager.

The Spearfish Co. in February produced

\$23,000. Five days were lost during the month on account of repairs being made to the mill. The amount of ore handled during the month was 4595 tons, and the average value per ton was \$6.02.

The new Hidden Fortune mill on White-wood creek, below Deadwood, will start April 1st. The Colorado Iron Works, building the plant, will operate it thirty days before turning it over to the company. The Hidden Fortune Co. is doing its principal work, says the Black Hills Mining Review, in the Bingham shaft. Development work is progressing on the Lead side of the hill, in the Cambrian. This ore lies in blanket form, near the surface, and is being stripped of the overlying material that it may be mined in open pits. The ore varies in thickness from 4 to 15 feet, and the average of the ore is good. Some of it is rich in gold, while in parts the value is nominal. It is the intention to supply the mill with this ore at first.

UTAH.

BEAVER COUNTY.

Foundations are laid for the power house to supply electricity for a battery of electric drills at the Old Hickory, near Milford. A 20 H. P. gasoline engine will be used and will generate power for ten drills.

IRON COUNTY.

Consulting Engineer J. B. Jenson of the Summit Placer Co., operating in the hydrocarbon regions, near Soldier Summit, says the output of the mine is to be doubled. The product of the property consists of mineral wax, a market for which is found in New York and Germany. An additional extractor is being installed, also an automatic elevator and feeder and an 80 H. P. boiler. With this machinery in place the plant will have a capacity for handling 100 tons of material per day, and will turn out three tons of refined wax. The mineral wax is used in the manufacture of rubber goods. In Germany it is manufactured into a paint, which is applied to hulls of vessels to prevent gathering of barnacles.

JUAB COUNTY.

The proposed consolidation of the Victor and Boss Tweed groups of Tintic district, near Eureka, has been ratified by the stockholders, and E. V. McCune, H. P. Henderson, J. A. Groesbeck, Jr., C. O. Ellingwood, W. S. McCormick elected directors. J. Treloar is superintendent of the consolidated properties, and says he is forwarding to the smelters eight carloads of copper ore a week that nets the company \$16 per ton. The Victor Con. M. Co. is the new name.

A. M. Cannon, president of the Dugway M. Co., says operations will be resumed at their mines at Dugway in Deep Creek district, near Fish Springs, with W. Leatham as superintendent.

MILLARD COUNTY.

H. N. Burns, manager of the Oil City Oil Co., operating at Desert Switch, says he expects to bring in a well between the present depth of 1700 feet and 2500 feet, though the machinery is capable of boring 3000 feet. He says that before the summer is over there will be fifty rigs working in the eastern Utah fields.

PIUTE COUNTY.

(Special Correspondence).—H. L. Mills will develop his Juno claim on Two Mile creek, near Marysvale. The ore carries gold, silver and lead.

The Henry Bradburn Co. is making arrangements to work its property in the North Fork of Cottonwood.

A body of ore has been opened up in the Trapper's Pride.

F. M. Haughey of the Standard group reports ore being taken out.

Marysvale, March 14.

(Special Correspondence).—A strike of gold ore above Ten-mile creek is reported. The property is owned by R. DeWitt and Robbins Bros. of Gunnison. Three shoots of ore have been uncovered within a distance of 1000 feet along the vein. In the shaft is a 10-inch streak of shipping ore, and the balance of the vein, 2½ feet wide, carries gold running from \$5 to \$50 per ton.

The larger portion of this section has been but little prospected.

The Silver King and Gold Queen mines, near the head of Deer creek, have been handed to S. A. King of Provo.

A shipment of two cars of iron ore will be made from the Iron mines, 3 miles from this camp.

Marysvale, March 14.

SALT LAKE COUNTY.

Manager J. B. Jenson says good headway is being made at the Pioneer sampler at Sandy, where machinery is being installed preparatory to putting the plant into commission again. He expects to resume by April 1.

An option on the Panhandle and A.

Stuart groups at Bingham has been given to the Sampson M. Co. for \$25,000.

On the 600 level of the York mine, at Bingham, a vein of ore 1 foot in width has been opened up which carries with it values in lead, silver and copper. The vein was encountered while crosscutting to the contact of the vein, which Manager Orem says is yet 60 feet away.

SUMMIT COUNTY.

The first annual report of the Daly-Judge mine, near Park City, states that the new company now owns 1200 acres of mining ground, with 15,000 feet on the strike of the vein, of which 2500 feet have been partly prospected. The machinery has been overhauled within the year and the mill reconstructed and enlarged to a capacity of 300 tons daily. Since incorporation many improvements have been made in the mine, including the widening and retimbering of the drifts, enlargement of the main shaft, refixing grades, etc., beside the construction of numerous buildings and installation of electric and other machinery. From the operations of the old mill 20,000 tons of zinc "middlings" have accumulated, containing 20% to 30% zinc, beside silver and lead values. This dump has been leased to the Magnetic Zinc Separating Co. of Park City, and this ore, heretofore valueless, will now realize a profit. It is estimated that 120,000 tons of ore are blocked out in the mine.

The Aristocrat M. Co. is incorporated at Park City. The holdings are two claims between the Cincinnati and the Creole groups; T. H. Paul, H. M. Sborn, J. C. Hasson, J. Frankel and G. Ketchum are the directors. The shaft is down 30 feet, and will be continued to the contact at 200 feet.

H. M. Crowther, consulting engineer American Flag M. Co., Park City, says the main shaft is down 340 feet and they are sinking at the rate of 3 feet per day. It will be continued to 400 feet before crosscutting to the ore bodies.

TOOELE COUNTY.

J. Dederichs & Co., operating the Black Diamond mine, near Stockton, report opening up in the north drift on the 150-foot level a 2-foot body of lead carbonates and galena.

The Metallic Hill M. Co. of Salt Lake City has incorporated; D. S. Taggart, J. P. Nelsen, H. H. Green, A. K. Tiernan. The company owns the Metallic Hill Nos. 1, 2, 3, 4 and 5, the Cache and the Confidence lode claims, Dugway district.

WASHINGTON COUNTY.

A landslide breaking a section of the ditch has delayed starting up the smelter of the Utah & Eastern C. M. Co. on Dixie ores at St. George, says Manager J. E. Beveridge. This ditch conducts water to the smelter from the Clara river, 3 miles distant.

The Virgin River Oil & Exploration Co. is incorporated. The company has 9000 acres near Virgin City. A well will be sunk.

WASHINGTON.

OKANOGAN COUNTY.

An option on the Mountain View and Keep Cool claims at Bodie, on Toroda creek, has been given to Manager D. W. McKinley of a San Francisco company for \$5000. The lead is 9 feet wide and shows values of \$8 per ton in gold. A shaft has been sunk 50 feet on the Keep Cool. The claims adjoin the Golden Reward.

SNOHOMISH COUNTY.

The Good Hope mine, above Mineral City, near Index, was sold last week to F. Thompson and W. J. Walters for \$1500. There is a 5-foot ledge opened up carrying gold, silver and copper ore.

Superintendent Sutton says the framing of the mill and cyanide plant of the Independent mine, near Silverton, is nearly finished, and the machinery will be installed next month. He expects to have their entire plant in operation by June 1. Water power will be used and they will treat 300 tons of ore daily. The ore carries mispickel.

STEVENS COUNTY.

Men are at work on the Double Standard mine, 7 miles north of Northport, on the line of the Red Mountain Railroad. The Double Standard is owned by J. E. and G. A. Almstrom and H. W. Walker of Northport.

T. Greenway, general superintendent of the Columbia River Marble Co., near Bossburg, says he will put up a sawmill and make lumber to erect buildings for the men and for the installation of machinery, after which a channeler will be put in operation taking out marble for shipment, as there is a considerable area of marble stripped ready to be hocked out.

T. F. Hertzell, manager of the Hertzell-Jay Gould M. Co., near Chewelah, says on the Jay Gould a sinking pump has been installed and sinking will be resumed on the main shaft April 1st, going down

to 300 feet. Last month, at 112 feet from the main shaft, a shoot of ore was cut, showing shipping ore 2 feet wide, with 15 feet of concentrating ore. The galena runs 50 ounces silver, 20% lead, \$5 gold and some copper.

WYOMING.

CARBON COUNTY.

The Con. G. & Coal Co. has been organized at Grand Encampment, consolidating the El Rey in Purgatory gulch, near Encampment, the North Park (Colo.) gold fields, and a copper mine adjoining the Coldwater mine at Pearl. J. E. Hedding, W. S. Price, E. R. Miller and J. W. Van Valzah of Pennsylvania, S. R. Neel, E. S. Drury and W. C. Henry of Grand Encampment, Wyo., are the directors.

Gold-bearing rock is reported found 2½ miles southwest of Battle Lake. Twenty men are at work in the Doane Rambler copper mine at Battle Lake. There are 2325 feet of underground workings opened up. A body of copper ore has been opened in the Aetna mine on Beaver creek and shipments begun. The men employed at the Ferris-Haggerty mine have been placed on the same wage scale as prevails in Colorado, by which some get an increase and others a slight decrease. These latter, however, will work shorter hours.

A strike is reported made last week in the main tunnel of the Aetna mine on Beaver creek, near Riverside. The vein is 4 feet wide and 30 feet of it has been uncovered. Assays show 20% copper with some gold.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—With lead now near the \$14 mark on the London market, and several agents of American smelting concerns exerting themselves to procure Kootenay ores, the producers should soon be receiving 2c. per pound for their product. This will permit the operation at a profit of every silver-lead property in the Slocan and East Kootenay, capable of producing ore in shipping quantities.

An important factor in the silver-lead industry of this Province is the demand for the zinc ores heretofore thrown on the waste dumps of the Slocan mines. Several shipments of zinc ore from Slocan mines have been made to the Lanyon smelter at Iola, Kas., during the winter, and several of the mines are now making special arrangements to care for this product, the Slocan Star installing a concentrating plant for that purpose.

A second gold brick weighing 150 ounces has been sent off by the Broken Hill M. & Development Co., and with the first brick weighing 84 ounces previously sent off, represents the result of the first run of the Wilcox mill for a period of a little over one month. The value of the hullion (produced in the neighborhood of \$3500, while the concentrates made will probably bring the total returns for the run to over \$5000.

Returns from the Ymir mine for January are just to hand. During the month 4200 tons of ore crushed, with sixty stamps running twenty-nine days, yielded 1711 ounces of bullion, gross estimated value, \$70,365. There were 265 tons of concentrates shipped to Nelson smelter, at a gross value of \$9020. The cyanide plant treated 2550 tons, gross estimated value, \$4125; total working expenses for the month, \$16,750.

Nelson, March 15.

The Blue Jay mine, in Skylark camp, Boundary, has been leased on a working bond for \$10,000.

The Green Mountain mine, near Rossland is closed down for the present, the diamond drill prospecting being finished.

The foreign coal shipments from Nanaimo of the Western Fuel Co. for February amounted to 6406 tons. There were shipped from Ladysmith 20,986 tons. The total output of the Extension mines for February was 45,000 tons.

The Erie Placer M. Co. was incorporated last week at Spokane, Wash. The company owns placer ground near Erie. A hydraulic plant will be installed. F. E. Goodall, C. E. McBroom, W. H. Cowles, M. P. McCoy, W. A. Nicholls, I. M. Cornthwaite and R. D. Miller are the incorporators.

At Quatsino Sound, on Vancouver Island, the main tramway and the two branch tramways on the Comstock group are completed. The Yreka Copper Co. have been hampered in the delays in the arrival of material. The wharf and ore bunkers are finished and men are at work installing a compressor plant. The first shipment of ore to the smelter was made by steamer last week.

Superintendent Toy, of the Golden Eagle mine, of Alberni, says operations were stopped last month owing to heavy

snow, but will resume on a larger scale when spring opens. Thirty men were at work. It is a gold quartz proposition. Manager Bailey, of the English-Canadian Co., says he will open up the W. W. W. mine, on Granite creek, near Alberni. The Con. Cariboo Hydraulic M. Co. has leased the dam at the outlet of Quesnelle lake, near Quesnelle, says Manager Hobson.

The Hematite group of iron mines on Iron creek, a tributary of Bull river, near Fort Steele, consists of twelve claims, through which three veins of hematite run. The veins are from 10 to 25 feet in width, with stringers running into the main veins. A recent analysis showed: Iron, 34%; sulphur, 15%; phosphorus, trace.

It is reported the St. Eugene mine, at Moyle, will resume operations by April 1, due to the rise in lead on the London market. J. Cronin, manager, says ore reserves are blocked out in its horizontal workings sufficient for a three years' supply for the mill (350,000 tons).

Rossland mines are employing a total of 868 men, as follows:

Le Roi.....	360
War Eagle & Center Star.....	299
Josie Mine.....	75
Kootenay.....	30
Velvet.....	50
Number 1 (Le Roi No. 2).....	21
White Bear.....	18
Silica Works, Green Mountain, O. K.....	15

To these, as wages for February, was paid last week an aggregate of \$66,100.

Three miles from Fort Steele J. Taen-hauser is developing a copper property under Superintendent Judd. A tunnel is being run to cut the vein at a depth of 200 feet.

J. A. Darragh, superintendent of the Wide West mine, near Lardeau, has closed down work for the present. The crosscut tunnel is in 511 feet and has not yet cut the main vein. At 218 feet from the portal it cut a 14-inch vein of galena, which gave values in gold, silver and lead. The next lead was cut at 300 feet and was 5½ feet wide, with galena and carbonates.

The White Bear mine (the Black Bear claim of the Le Roi group to the south) at Rossland will begin shipments this month of ore from the shoot opened up in the drift on the 900-foot level.

The Canadian Smelting Works at Trail propose to make some additions to their equipment. The experiments in the refining department are practically completed, having extended over a year, and plans are being made for a refining plant to produce ten tons of lead per day additional. Two electric generators will be put in. The electrolytic method of lead refining is the one in practice at the Trail smelter.

CANADA.

ALBERTA.

The Canadian-American Coal & Coke Co.'s mines at Frank are shipping 1000 tons of coal per day, says Superintendent J. J. Fleutot. The main entry of the mine, which is in 6600 feet, has obtained a depth on the coal vein of 1000 feet. The vein, which is nearly vertical, averages in width 15 feet of clean coal. Nearly 3000 tons of coal are broken daily, about two-thirds of which are left in the rooms to be drawn out at some future time. An electric plant is being installed.

NOVA SCOTIA.

It is reported a seam of anthracite coal has been found at Hunter's mountain, Victoria county. Several years ago coal from this locality was submitted for test at the Geological Survey Department, but the main seam could not be located. This find is 6 feet wide.

MEXICO.

CHIHUAHUA.

A strike has been made in the Veta Grande mine, in the Parral district, which was bought recently by the American S. & R. Co., for \$200,000. The production of the mine is now more than \$300,000 per month.

The Americano mine at Terrazas was sold last week to the Torreon Smelter Co. for \$100,000 gold, says F. Esher, general manager of the Torreon smelter, and work has begun.

Near Ojo Caliente, Burns & Daly, of Ahumada, have bonded, for \$45,000 gold, the Grito de Dolores, Independencia, Constitucion and Oriente mines. They carry gold, silver and lead.

DURANGO.

Over 6000 pertenencias were denounced in the State of Durango during the first three weeks of February. Of these 3400 were denounced by a single individual, J. McDonald, near Sardinias, district of El Oro, says the Chihuahua Enterprise.

SONORA.

W. C. Green denies the recently pub-

lished report that he has sold the Cananea copper mines to the Rockefeller interests, and also says that there are 1400 American miners in Cananea and 400 Mexican miners.

It is reported the Mimbres M. Co., J. C. Bagley superintendent, will build a smelter on its property near San Javier.

The Cerro Colorado copper mines on Cerro Colorado mountains are under option to G. Gruning, A. H. Horffer and company of Hermosillo. W. Kiddle is superintendent.

The Sunset Coal M. Co. has been operating the coal and coke mines at Barranca for four years, and holds of anthracite and natural coke have been opened up. Bins are being erected preparatory to shipping, to supply the local demand.

NEW ZEALAND.

At Waihi the increase in output is due to the returns of the Waihi Co. This company, owing to the conversion of their dry crushing plant to that of wet, shows in the year's output a large increase. For 1901 the amount of ore treated was 159,325 tons, which yielded £461,205 hullion. For 1902 179,587 tons were treated, from which hullion to the amount of £520,138 was produced, showing an increase of £58,933. They have not yet reached their highest stage of production, inasmuch as the old Waihi mill of ninety stamps has only been recently converted, and it is only since the commencement of this 1903 year that sixty of the ninety stamps have resumed crushing on the wet system. In a week or so the balance of the ninety stamps will drop, bringing the mill up to full crushing capacity of 330 stamps. The hullion yield for 1903 should be not less than £550,000.

SOUTH AFRICA.

RHODESIA.

The total gold output for the month of January amounts to 16 245 ounces—an increase of thirty-five ounces over the previous month. Monthly returns since 1901 have been as follows:

	1903.	1902.	1901.
Ounces.	Ounces.	Ounces.	Ounces.
January.....	16,245	15,955	10,787
February.....	13,214	12,237	12,237
March.....	16,891	14,289	14,289
April.....	17,559	14,998	14,998
May.....	19,698	14,469	14,469
June.....	15,842	14,863	14,863
July.....	15,226	15,651	15,651
August.....	15,747	14,734	14,734
September.....	15,164	13,958	13,958
October.....	16,849	14,503	14,503
November.....	15,913	16,487	16,487
December.....	16,210	15,174	15,174
Totals..	16,245	194,268	172,060

Total for 1898, 18 085 ounces; 1899, 65,303 ounces; 1900, 91,816 ounces.

TRANSVAAL.

In the Pretoria diamond fields, the Schuller diamond mine was the first discovered; but, owing to the hardness of the ground, it was found impossible to treat it successfully. Further prospecting resulted in finding another pipe to the east. The ground in the newly discovered pipe presented the characteristic features of the Kimberley pipes, the surface portion being yellow and yielding plentifully, although the stones were generally of a low grade.

SWEDEN.

The Slangeli copper fields, which extend on each side of the boundary between Norway and Sweden, have been sold to the American Copper Co. for \$1,000,000, says a dispatch from Osterund.

PERSONAL.

T. CLARK, of Placerville, Cal., is in San Francisco, Cal.

G. McM. ROSS, of Virginia City, Nev., is in San Francisco, Cal.

D. McREA is in Denver, Colo., from Thunder Mountain, Idaho.

E. G. STOEBER, of Denver, Colo., is in Mexico on mining business.

W. S. JONES is manager of the Cloud City mine, near Leadville, Colo.

G. H. LEWIS, of Butler, Nev., is in San Francisco, Cal., on mining business.

A. R. ENGLISH, of Blsbee, Ariz., has gone to New York on mining business.

T. DERBY, of New Almaden, Cal., is in San Francisco, Cal., on mining business.

S. HUBBARD, JR., of Prescott, Ariz., is in San Francisco, Cal., on mining business.

F. C. LEONARD has returned to Salt

Lake City, Utah, from a trip to Kansas City.

J. F. PARKES, superintendent of the Kennedy mine, Jackson, Cal., is in Arizona.

N. H. MELIOR is superintendent of the Chittenden copper mines, near Florence, Ariz.

J. W. NEILL, of the Tintic M. & D. Co., is in New York from Salt Lake City, Utah.

P. W. FLEMING is at Globe, Arizona, with J. B. Coplen, making mine examinations.

C. W. PAGE returned last week to Denver, Colo., from a trip East on mining business.

F. BETTLES, of Salt Lake City, Utah, is examining mining properties near Butler, Nev.

R. CULVERT, of Amador City, Cal., is assayer at the Harvard mine, near Jamestown, Cal.

A. L. McEWEN has resigned as superintendent of the California mine, near Sumpter, Or.

W. LEATHAM is superintendent of the Dugway M. Co., at Dugway, near Fish Springs, Utah.

E. M. BINFORD is superintendent of the Carls mine, Tintic district, near Eureka, Utah.

F. N. C. WHYTE, manager of a copper property at Anaconda, Mont., is in San Francisco, Cal.

F. F. THOMAS, manager of the Gwin mine, Calaveras county, Cal., is in San Francisco, Cal.

SUPERINTENDENT HAMPTON of the Onida mine, near Jackson, Cal., is in San Francisco, Cal.

J. F. MILLS has returned to San Francisco, Cal., from inspection of mines in southern Nevada.

E. ROGERS of Toronto, Canada, has resigned as managing director of the Crow's Nest Pass Coal Co.

W. E. DOWNS, of Sutter Creek, Cal., civil engineer for the Kennedy mine, is in San Francisco, Cal.

G. W. RASDELL, superintendent of the Rawhide mine, near Jamestown, Cal., is in San Francisco, Cal.

C. R. DOWNS, superintendent of the Bunker Hill mine, Amador City, Cal., is in San Francisco, Cal.

DAVID McCLURE, superintendent of the Gwin mine, Calaveras county, Cal., is in San Francisco, Cal.

A. M. CANNON, president of the Dugway M. Co., is at Fish Springs, Utah, from Salt Lake City, Utah.

L. A. GROSS, superintendent of the Centennial mine, near Drytown, Cal., is in San Francisco, Cal.

W. A. SHEARMAN, of Salt Lake City, Utah, has gone to the Pactolus group of mines near Butler, Nev.

R. C. KNOX has returned to Norris, Mont., from a trip to Salt Lake City, Utah, on mining business.

W. J. CHALMERS, of the Allis-Chalmers Co., returned on the 17th from San Francisco, Cal., to Chicago.

J. GOODRICH, resident manager of the Highland Chief mine, near Wardner, Idaho, is in St. Paul, Minn.

H. A. KELLER is superintendent of the Horseshoe M. Co., near Central City, S. D., vice R. W. Rodda, resigned.

E. C. VOORHIES, superintendent of the Lincoln mine, Sutter Creek, Cal., is a visitor in San Francisco, Cal.

C. R. TOWNSEND is superintendent of the California mine, near Sumpter, Or., vice A. L. McEwen, resigned.

ELWOOD MEAD, of the United States Geological Survey, is in San Francisco, Cal., from Washington, D. C.

W. C. GREENE of New York, president of the Greene Con. C. M. Co. of Sonora, Mex., is in San Francisco, Cal.

SUPERINTENDENT PATRICK of the Tonopah Syndicate G. M. Co., at Butler, Nev., is in San Francisco, Cal.

J. A. VEATCH, manager Darlen G. M. Co., U. S. of Colombia, S. A., is in San Francisco, Cal., on a business trip.

M. B. KERR, manager of the Jumper Gold Syndicate of California, Ltd., at Stent, Cal., is in San Francisco, Cal.

W. E. RENSHAW, of Idaho Springs, Colo., manager of the Gem Con. M. Co., is in Pittsburgh, Pa., on company business.

W. F. DETERT, superintendent of Zeila mine at Jackson, Cal., and president of

the Argonaut M. Co., is in San Francisco, Cal.

S. K. THORNTON, superintendent of the Shenandoah mine near Plymouth, Amador county, Cal., is in San Francisco, Cal.

J. KEMP VAN EE, superintendent of the Royal Con. mine at Hodson, Calaveras county, Cal., is in San Francisco, Cal.

W. R. THOMAS, superintendent of the Central Eureka mine, Sutter Creek, Cal., is in San Francisco, Cal., on mining business.

E. P. COWEN returned last week to Boise, Idaho, from a two months' trip on mining business to Missouri and Texas points.

R. G. BROWN, manager of the Standard Con. M. Co., has returned to San Francisco, Cal., from a trip to their mines at Bodie, Cal.

T. H. ELLIS, president of the Yellow Jacket M. Co. and manager of the Detroit-Alaska M. Co., near Juneau, Alaska, is at Juneau.

W. W. WORTHING, of Stockton, Cal., superintendent of the Rhetta mine, near Plymouth, Amador county, is in San Francisco, Cal.

C. C. DERBY, superintendent of the mines of the Mariposa Estate with headquarters at Mount Bullion, Cal., is in San Francisco, Cal.

W. DAVIDSON, of Salt Lake City, Utah, is manager of the Caribou group of mines at Ophir, Colo., and will make his headquarters there.

MANAGER REBER of the Gold King and Crown Point groups, near Mountain Home, Idaho, has returned from Salt Lake City, Utah.

A. B. RICH, of Denver, Colo., is assayer at the Silver Bell mine, at Ophir, Colo., vice A. C. Gates, resigned to accept a similar position with a company at Globe, Ariz.

MANAGING DIRECTOR A. F. HOLDEN of the United States M. Co. returned last week to Salt Lake City, Utah, from California, and left the following day for the East.

J. G. ENGLISH, part owner of the Amazon group of mines near Sumpter, Or., has returned to Danville, Ill., from examining mining properties in Oregon and Washington.

W. DEAN, F. CARPENTER, W. H. VINTON, C. O. ROBBINS and O. W. CASSADAY, directors of the Valley M. Co., are visiting the company's mine at Leadville, Colo.

D. EVANS returned last week to Salt Lake City, Utah, after a protracted absence in California, and will devote his attention to the properties of the Mountain Lake C. Co., near Brighton, Utah.

A. B. CAMPBELL and J. A. FITCH of Spokane, Wash., operating Idaho and Montana mining properties, are in San Francisco in connection with reported transfers of Kendall, Montana, property.

H. Z. OSBORNE of Los Angeles, Cal., recently made a mule-back trip through the southwestern part of the State of Chihuahua, Mexico, visiting the mining districts of Guadalupe y Calvo, Bohorame, and La Cumbre, and returning by Parral.

F. L. SIZER of Helena, Montana, has been retained as consulting mining engineer by the Kimberly-Montana G. M. Co., which has taken over the Bear Gulch mines, near Jardine, Montana. The new company is preparing to operate on an extensive scale.

Commercial Paragraphs.

THE Main Belting Co. has opened its New York office in the Mutual Reserve building, 309 Broadway, room 913, for the prompt dispatch of business.

THE Jeanesville Iron Works Co., through the Denver Branch, reports as having shipped a large triple expansion pump, capacity 2100 gallons per minute, to the El Paso Con. gold mine, Cripple Creek. It required three cars to haul it. This pump is fitted with Corliss steam valves.

In connection with some recent changes in the Union Iron Works of San Francisco, Cal., the by-laws have been revised in accordance with the Eastern ideas, the finance committee having been made the ruling body. This committee is composed of Messrs. Max Pam, chairman, Lewis Nixon and H. T. Scott. The office of chairman of the board has been instituted. This chairman of the board is the chief

executive officer of the company, and as such presides over all meetings of directors and stockholders. Mr. Henry T. Scott was elected chairman of the board. The operating department is placed under the charge of the president of the company. Mr. W. G. Dodd has been elected president. The vice-president is named to act in the event of the inability of the president to do so. This office has not been filled as yet, but will be very shortly by Mr. Frank Jeffery, who will be in personal charge of the ship yard. Mr. Charles N. Champion is elected to fill the offices of secretary and treasurer, and Mr. L. J. Hart to fill the offices of assistant secretary and auditor.

Obituary.

ELIAS WELLER, a pioneer of El Dorado county, Cal., died at Sacramento, Cal., March 8, aged 75 years.

ADRIAN J. MERLE, a California pioneer, and for over a generation a prominent business man of San Francisco, died at his residence in Alameda, Cal., on the 15th inst., aged 62 years. Deceased was a native of France. He was president of the A. Merle Co., and of the Globe Brass & Bell Foundry, and leaves an honored name.

New Patents.

DEWEY, STRONG & Co's SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MARCH 10, 1903.

- 723,444.—LIFT—C. A. Bouck, Los Angeles, Cal.
- 723,651.—TEMPORARY BINDER—W. J. Brown, Portland, Or.
- 723,488.—HEADER PLATFORM—Campbell & Schwartz, Grass Valley, Or.
- 723,490.—COMBINATION SUIT—Mary E. Cavanaugh, Alameda, Cal.
- 723,413.—COFFEE POT—T. C. De Hart, Oakland, Cal.
- 723,364.—ELEVATOR—W. L. Holman, S. F.
- 723,513.—BALING PRESS DOOR—A. Johnson, Lafayette, Cal.
- 723,530.—OIL BURNER—J. McDermott, West Berkeley, Cal.
- 723,374.—BRACKET SCALE—G. E. Miller, Arlington Place, Cal.
- 723,315.—COMB—C. Moeschel, Los Angeles, Cal.
- 723,619.—LOCK—B. Phelps, Seattle, Wash.
- 723,621.—LOCK—B. Phelps, Seattle, Wash.
- 723,611.—LOCK—B. Phelps, Seattle, Wash.
- 723,632.—LOCK—B. Phelps, Seattle, Wash.
- 723,623.—LOCK—B. Phelps, Seattle, Wash.
- 723,357.—CONVEYER BELT—H. D. Richards, Sutter Creek, Cal.
- 723,633.—NECKTIE—Samter & Pinner, S. F.
- 723,638.—EVAPORATING PAN—E. R. Shaw, Ontario, Cal.
- 723,463.—PUMP LIFTER—I. D. Stark, Red Bluff, Cal.
- 723,644.—ABDOMINAL SUPPORTER—Eva M. Temple, Portland, Or.
- 723,467.—PICTURE HANGING DEVICE—W. F. Towne, Oakland, Cal.
- 723,473.—RAILWAY TIE—W. A. Wetmore, S. F.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co's SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PICTURE HANGING DEVICES—No. 723,467. March 10, 1903. W. F. Towne, Oakland, Cal. The object of this invention is to provide a device, first, by which a picture hook by itself may be securely held while being placed in position upon the molding; second, by which a picture may be hung upon a hook already on the molding or upon a fixed support, as a nail; third, by which a picture and hook may be hung at one and the same time, whether a double or single cord or wire is used. The device does away with the necessity of climbing upon a stepladder or the like in order to engage or disengage the suspending wire or cord.

COMBINATION SUITS—No. 723,490. March 10, 1903. Mary E. Cavanaugh, Alameda, Cal. This invention consists in forming a complete suit for a child, including waist, collar, vest and overalls, all in one piece, and in a novel construction and arrangement of the parts with relation to each other. The trousers portion has an upward extension; the waist consists of a single continuous piece extending around the body and forming a double thickness beneath said upward extension of the trousers, said waist permanently attached to the trousers with an inter or extension below the line of connection for the attachment of under drawers.

OIL BURNERS—No. 723,530. March 10, 1903. J. McDermott, West Berkeley, Cal. This invention relates to an apparatus for the combustion of hydrocarbon oils and its preparation therefor previous to reaching the burner tip. It consists of devices by which the oil is finely divided and mixed with a suitable quantity of steam or air and finally delivered from the burner tip in condition for combustion. The mixing chamber contains a tip at the burner tip at the front, a removable chamber located between the mixing chamber and the tip and having plates located therein, said plates being formed with transverse concave-convex grooves and convergent from the rear to the front.

RAILWAY TIES—No. 723,473. March 10, 1903. W. A. Wetmore, San Francisco, Cal. The object of this invention is to provide an improved cross

tile for railway use in which the major portion of the tie is made of comparatively indestructible material and the ends or supports upon which the tie rests are made of short sections of wood detachably fixed to the steel portion of the tie. It consists of a rolled plate having flanges forming channels above and below, the upper channels being convergent and narrower toward the top, wooden blocks adapted to fit and be locked in said channels to form rail supports, shoulders formed at the ends of the channels equalizing with the outer ends of the block and the tie being downwardly projecting flanges fitting upon each side of the wooden blocks, and means for securing said plates and railway rails upon the blocks.

DOOR CLOSING MEANS FOR BALING PRESSES—No. 722,513. March 10, 1903. A. Johnson, Lafayette, Cal. This invention relates particularly to a novel form of toggle lever mechanism for actuating the door of baling presses of that class in which the material is fed in through an opening in the side of the press box upon the follower; and its object is to simplify the construction and operation of such mechanism. A door is hinged at the lower edge of the press box, with vertical guide walls between which said door is movable; a bent lever has its ends fulcrumed in said sides, with links pivoted to said lever and to the door to form toggle joints; pinions upon the ends of said lever, gear wheels engaging the pinions, and connections between said gear wheels and sweep by which said toggles are actuated to close the door.

Latest Market Reports.

SAN FRANCISCO, March 20, 1903.

METALS.

SILVER.—Per oz., Troy: London, 22½d (standard ounce, 925 fine); New York, bar silver, 48½c, refined (1000 fine); San Francisco, 48½c; Mexican dollars, 38 @ 39c San Francisco, 38c New York.

COPPER.—New York: Standard, \$14.00; Lake, 1 to 3 casks, \$14.50 @ 15.00; Electrolytic, 1 to 3 casks, \$14.75 @ 15.00; Casting, 1 to 3 casks, \$14.60 @ 15.00; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £66 6s 6d spot per ton.

There is no material change in the copper situation since last week, other than a firm market, and no indications of a falling off in price. New enterprises do not immediately give signs of the effect of a raise in price and most old producers are already working to their full capacity. If the price is maintained between 14 and 15 cents, the output will be materially increased within six months.

LEAD.—New York, \$4.67½; Salt Lake City, \$3.50; St. Louis, \$1.00; San Francisco \$1.60, carload lots, 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 6½c; pig, \$4.76. London: £13 12s 6d per long ton = 2.75c per lb.

SPELTER.—New York, \$5.50; St. Louis, \$4.60; London, £23 10s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 @ 15c.

TIN.—New York, pig, \$29.80 @ 30.10; San Francisco, ton lots, 32c; 500 lbs., 32½; 200 lbs., 32½c; less, 33c; bar tin, \$1.10, 35c @ 37½c. London, £136 12s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 @ 19.00; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$45.50 @ 46.00; large lots, London, £8 16s; San Francisco, local, \$45.00 @ 46c of 76½ lbs.; Denver, \$49.50, export, \$43.50.

BABBIT MENTAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99 6 pure ingots, 36c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 21c; San Francisco, Plumbers', 100-lb. lots, 17.65c.

NICKEL.—New York, 50 @ 60c @ 100; ton lots, 45 @ 48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.10; gray forge, \$20.50; San Francisco, bar, 3c @ 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

CHEMICALS.—Cyanide of potassium, 98%—99%, johhng, 26 @ 26c @ 100 lbs.; 24 @ 24½c; in tins, 35c; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 24 @ 30c @ 100 lbs.; caustic soda, in drums, 3 @ 4c @ 100 lbs.; Cal. s. soda, hbls., \$1.25 @ 1.60 @ 100 lbs.; sks., \$1.06; chlorate of potash, 12 @ 13c; nitrate of potash, hbls., 8c; caustic potash, 10c in 40-lb tins; borax concentrated, 7 @ 8c @ 100 lbs.; roll sulphur, 4 @ 6c; powdered sulphur, 2 @ 3c; flour sulphur, French, 2 @ 3c; alum, \$2.00 @ 2.25; California refined, 2 @ 2½c; sulphide of iron, 9c @ 10c; copper sulphate, 5 @ 7c; chloride of lime, spot, \$3.00 @ 4.00; sulphuric acid, in carboys, 66 @ 6, 2½c @ 10c; nitric acid, in carboys, 8c @ 10c.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00 @ 22.00; extra sizes higher; redwood, \$22.00 @ 23.00; lath, 4 feet, \$4.25 @ 4.50; pickets, \$19.50; shingles, \$2.36 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @ 32.00.

AILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.35; Cut, \$3.35; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.60; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.66; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.66, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s. 10½c @ set; 14 oz., 40s., 9½c.

CEMENT.—Germania, \$2.50 @ 2.75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50 @ 2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$6.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.60; Brymbo, \$7.60; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linsed, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, hbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 22½c; Astral, 22½c; Star, 22½c; Extra Star, 25½c; Eocene, 24c; Elaine, 27½c; Water White, in bulk, 16c; Mineral Seal, iron hbls., 18½c; wooden bbls., 21c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86 Gasoline, bulk, 21c; do., cs., 27½c; 63 Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22½c; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50 @ 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 50 @ 55c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, ¾c per lb. above keg price. Dry Lead—in hbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @ 9c per lb.

BONE ASH.—Extra No. 1, 5 @ 6c per lb. No. 1, 4 @ 5c.

BORAX.—Concentrated, 7 @ 9c per lb. powdered, 9 @ 12c; fused, 25 @ 30c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c @ 5c.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5 @ 7c.

MANGANESE.—(90% and over) ½ lb., \$1.26.

MOLYBDENUM.—25c. ½ gramme; 1000 grammes—2½ lbs.

CHROMIUM.—(90% and over) per lb., \$1.26.

SODIUM.—Metal, ½ lb., \$1.25.

MERCURY.—Bichloride, ½ lb., 90c.

PHOSPHORUS.—(American) ½ lb., \$1.00.

SILVER.—Chloride, ½ oz., 90c @ \$1.00; nitrate, 65c.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

MEETING NOTICE.

A convention is hereby called to meet at the Palace Hotel, San Francisco, Cal., on Wednesday, March 25, 1903, at 10 o'clock A. M., for the purpose of organizing a California Mine Operators' Association.

All mine owners, operators or companies are invited to attend.

BY ORDER COMMITTEE.

INVENTORS, Take Notice
L. PETERSON, MODEL MAKER,

544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

SITUATIONS WANTED.

A PRACTICING PHYSICIAN AND SURGEON, in San Francisco, of excellent standing, desires a position as surgeon to a mine or mining company. Is a graduate of the University of California. Best of references given. Address Box 12, this office.

ASSAYER WITH OWN OUTFIT WILL GO anywhere. Best references. Box 14, this office.

ASSAYER WITH OUTFIT WISHES A POSITION as superintendent of a mine, millman, smelterman or tool sharpener; 14 years' practical experience. J. L. Wetmore, 401 12th St., Oakland.

ASSAYER, CHEMIST AND MILLMAN (concentrating and amalgamating), thoroughly up to date in each branch, desires position. Best of references furnished of a 20-years' experience. Address Box 125, care Mining and Scientific Press, 606 Mack Block, Denver, Colo.

COMPETENT BOOKKEEPER, TYPEWRITER and general office man desires position with mining or smelting company. Can furnish best of references. Address Box 25, Mining and Scientific Press office.

COMPETENT MILLMAN, MACHINIST AND Chemist, Experience free mill and concentrating. College education. Have built and operated mill in Montana for 12 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. Reference the best. Address H., care this office.

MILLMAN AND ASSAYER, SEVERAL YEARS' experience, wants a position; will go anywhere. Address F. D., this office.

MILLMAN, PRACTICAL, WITH 20 YEARS' experience, wants a situation. Concentration, amalgamation, cyaniding and assaying. Best of references. Arizona or New Mexico preferred. Address "Millman," 1056 South Gaylord Street, Denver, Colorado.

PRACTICAL MINER WITH TECHNICAL EDUCATION, understands prospecting, blowpiping, surveying, etc., desires position. Address J. E. H., care of this office.

STAMP MILL MAN, EIGHT YEARS' EXPERIENCE, wants position. Address Box 20, Mining and Scientific Press.

WANTED, SITUATION AS ASSAYER—MINE, mill or smelter, Mexico preferred. At liberty May let. Am also an engineer and draftsman. Can furnish best of references. Address E. C., this office.

WANTED, POSITION AS SUPERINTENDENT of mill. Have had six years' experience in cyaniding in all the details of the process, including designing, building and operating plants. Wet crushing in cyanide solutions and elms treatment a specialty. Can superintend mine if desired. Will go anywhere. Address "Milton," care of Mining and Scientific Press.

YOUNG MINING ENGINEER OF SOME PRACTICAL experience desires position as assistant. Good surveyor, assayer and draftsman. Best of references as to character and ability. Will go anywhere. Address E. D. C., care of this office.

YOUNG MINING ENGINEER DESIRES POSITION as assistant. Good draftsman, assayer and surveyor. All references. Address L. E. M., care Mining and Scientific Press.

Have 100 Acres Dredging Land That Will Bear a Thorough Investigation

None but intending purchasers need apply. Address Box 19, this office.

I will give one-half interest in two mining claims or one-half interest in ten claims for \$100 each, to do assessment work in this great camp.

Address JOHN HOWSAM, Tonopah, Nevada.

RAILROAD SURVEYS. Applications for portions of Transients and Topographers will be received by the undersigned up to April 1st. None but experienced men need apply. The Company furnishes its own instruments and equipment. Address Chief Engineer O'gon and Pacific R. R., Room 29, 2nd floor, Mills Building, San Francisco.

THE CALIFORNIA DEBRIS COMMISSION, having received application to mine by hydraulic process from J. L. Miller, in North Eureka Placer Mine, near Railroad Flat, Calaveras County, Cal., draining into Spruce Gulch Creek, which reaches South Fork of Mokelumne River, and from John C. Jens, in Gold Hill Consolidated Placer Mine, near Esperanza, Calaveras County, Cal., draining into Calaveras and Esperanza Creek, which reaches Calaveras River, gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., April 6, 1903, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION having received application to mine by hydraulic process from Calaveras Development Co., in Aurelia Gravel Mine, near Railroad Flat, Calaveras County, Cal., draining into Independence Creek which reaches South Fork of Mokelumne River, gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., March 23, 1903, at 1:30 P. M.

Imperial Cable Coating.

For Hoisting, and all Wire Cables. PRESERVES. Over 1000 barrels sold by us in California, proving te superiority. Barrels 40c., cases 50c. per gallon.

GEO. PARTRIDGE & CO.,
123 California Street, San Francisco, Cal.

WANTED.

Wanted, to interest capital in a valuable placer claim suitable for DREDGING ONLY.
Address "Placer," care of this paper.

An Experienced Chemist and Assayer wishes to purchase a working interest in an established assaying and analytical office which is capable of extension and well located. Address A., Mining and Scientific Press, San Francisco.

Wanted---A Superintendent

For foundry, forge, machine and boiler shops employing 200 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answers confidential. Address Z., P. O. box 158, Station C, Los Angeles, Cal.

CAPITAL REQUIRED.

The owner of a mining claim, situated in one of the leading districts of California, at present being developed, is desirous of disposing of a one-half interest, the amount received to be expended upon the property. This is a legitimate and promising enterprise. For further particulars address Box 21, this office.

WANTED

STAKE TO PROSPECT A GOOD SECTION OF Montana. Am well acquainted with the State and technically educated. Address Prospector, care this office.

WANTED TO BUY.

A Good Second-Hand Mill or Concentrator of 25 to 40 Stamps, Steam or Water Power.

Must be cheap and machinery in good working order and situated so it can be dismantled and loaded on cars without great expense. Address "Stamp Mill," care Mining and Scientific Press.

WANTED.—PROSPECTORS AND LEASERS on private estate in California, 20,400 acres. Timber and water plentiful. The "GREAT STONEWALL" mine which has produced two million dollars of profit, which has never been prospected. For particulars, address

S. H. LUCAS,
CUYAMACA, CAL.

DELINQUENT SALE NOTICE.

WEIR FILTER COMPANY.—Location of principal place of business, San Francisco, California. NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 26th day of January, 1903, the several amounts set opposite the names of the respective shareholders, as follows:

	No. Cert.	No. Shares.	Amt.
H. L. Cope, Trustee.....	22	16,000	\$18 76
H. L. Cope, Trustee.....	23	16,000	18 76
H. L. Cope, Trustee.....	24	16,000	18 76
H. L. Cope, Trustee.....	26	24,000	80 00
H. L. Cope, Trustee.....	37	24,000	80 00
H. L. Cope, Trustee.....	38	24,000	80 00
H. L. Cope.....	6	2,990	8 74
B. A. Laws, Trustee.....	41	8,760	4 69

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

The Patio Process.

Although introduced in 1557 in Mexico, but little improvement has been made on the patio process, which seems to be particularly adapted to the treatment of the silver-gold ores of that Republic. A description of the chemistry of the process will be found in the MINING AND SCIENTIFIC PRESS of Dec. 27, 1902, and Jan. 3, 1903.

In the operation of the patio process the ore as it comes from the mine is broken into small pieces with hand hammers by men, women and children, who select or sort the ore, at which they become very expert. The high-grade or first-class ore is sent to smelters, the waste is neglected and that of medium value, the middlings, is sent to the hacienda for treatment. Here it is crushed in a rude stamp mill, often furnished with iron-shod wooden shoes having heavy stone dies. The stamp mill reduces the ore to coarse grains, and it is then ground to powder in either a Chilian mill or an arrastra, the latter being preferred in Mexico. This grinds the ore between heavy stones, which are dragged around the arrastra basin suspended from horizontal arms projecting from an upright central shaft. Mules are attached to the ends of arms which extend beyond the limits of the arrastra basin, about which they are driven in a circle. When the ore has been ground into pulp it is slimy and mixed with a large amount of water. It is run or dipped out of the arrastra into a broad, shallow pit, where the heat of the sun evaporates the water until it has reached the consistency of thick mud. It is then ready for the patio or yard.

This is a broad surface of ground prepared for the operations which take place there. It usually has a gentle slope, which allows superfluous water to run off. In this space are one or more circular plats, surrounded by a low rim of wooden blocks or stones. Within these shallow basins is the pulped ore, looking like mud and colored red, yellow, black or gray, depending on the character of the ore. According to the size of the basins, they contain from 20 or 30 to over 100 tons. When first introduced the pulp, or "torta," as it is called by the Mexicans, still contains a large percentage of moisture, which is still further evaporated. When the proper consistency has been reached, in the opinion of the major domo,

or overseer, salt is added in quantity suited to the ore, and mules or horses are driven into the basin and these are made to walk about and thoroughly mix the charge. A period of rest follows, lasting one or more days, when sulphate of copper and iron, obtained by roasting chalcopryite in reverberatory furnaces, is added. This sulphate is called "magistral," and is said to be superior to pure copper sulphate, though why this is the case has never been explained. Additional salt is introduced to the charge, as required. The addition and amount of all chemicals—salt, "magistral" and mercury—are all varied as to amount and time of introduction by the

value and character of the ore. It requires from two to six weeks to properly treat a charge of ore in the patio, the time being partly dependent upon the season of the year, as much of the success of the process depends upon the sun's heat. During the greater part of the time the horses or mules are driven about the bed of ore. The accompanying engravings illustrate characteristic scenes in the patio and a stamp mill.

The overseer makes occasional tests to determine when amalgamation is complete, and when this is considered satisfactory the animals are driven out of the pit, water is introduced to thin the pulp and the charge run off, leaving the amalgam behind on the floor of the basin, where it is collected, and the basin is ready for another charge of ore. Although a simple and somewhat primitive process, it saves a high percentage of the precious metals, and in a country where labor is cheap and time not an essential factor it is superior to pan amalgamation, both in point of economy and in results.

The illustration of the two-stamp mill is characteristic of some parts of Mexico, particularly in the region remote from railroads. This mill is near Guadalupe y Calvo, in the State of Chihuahua. This place was at one time the site of a government mint. The veins are fissures in andesites. Some of the veins are true quartz veins and others are simply crushed and mineralized zones of andesite. The principal mines of the district are the Rosario and the Independencia. The Rosario is one of the largest producing quartz veins in the world, being from 60 to 150 feet wide, with a bold outcrop visible from a great distance. There is an open cut on this vein 1800 feet long, 130 feet wide and several feet in depth. The Rosario vein is reported to have produced, from 1838 to 1847, \$40,000,000.

Electro-Magnetic Separation.

For years the low-grade sulphide ores of Leadville, Colo., and particularly those containing complex sulphides, as most of them do, having lead, zinc, iron and copper as well as gold, silver and other minerals in their makeup, have been an economic problem of absorbing importance to the mine owners and operators of that district. The most refractory ores are those combining large amounts of zinc sulphide with those of lead, iron and copper. There are reduction works where the lead and iron sulphides can be disposed of to advantage, but the lead smelters generally impose a penalty on zinc in excess of a stated percentage. Until recently there was no satisfactory method of separating the zinc from the accompanying sulphides, but the electro-magnetic separation of these minerals, which has only recently been accomplished, has apparently solved this vexed problem and has given a new impetus to mining in the "carbonate camp."

The Resurrection Company of Leadville has built an experimental plant for the separation of zinc sulphide from galena and pyrite; it is stated to be in successful operation, and the mill will be enlarged. A similar separating device has been introduced in British Columbia, it is stated, successfully, and valueless dumps of low-grade zinc-lead-copper and iron ore have suddenly assumed an importance and a value not previously available. In almost every lead-silver district in the world zinc appears sooner or later in depth and with it usually lower values in precious metals, and heretofore this combination of base sulphides has often resulted in suspension of mining and metallurgical operations, for the reason that the lead smelter did not want the zinc, and the zinc smelter did not want the lead or iron, and the copper smelter wanted neither zinc nor lead. As the new electro-magnetic separators are said to make a clean product of the zinc, leaving barely a trace with the lead, iron and copper, it may easily be understood how valuable an acquisition this new method of separation is to the industry of mining in those districts where these complex sulphide ores occur.

Mine Bell Signals.

The South Dakota Legislature has passed a law fixing a code of mine bell signals for use in all the mines of that State. It is always advisable to have strict uniformity in mine bell signals, as the likelihood to accident or misunderstanding between the miner underground and the engineer on the surface is greatly reduced thereby, but the code adopted in South Dakota is subject to some criticism. The code as published in the Black Hills Mining Review is as follows:

One bell, hoist; one bell, stop (if in motion).
Two bells, lower men; three bells, hoist men.
Four bells, blasting signal. Engineer must answer by raising bucket or cage a few feet and letting it back slowly; then one bell, hoist men away from blast.
Five bells, steam on; six bells, steam off.
Seven bells, air on; eight bells, air off.
Three two-two bells, send down tools.
Nine bells, danger signal (fire, accident or other danger). Then ring number of station where danger exists.
No person shall ring any signal bell except the station tender, unless in case of danger or when the main shaft is being sunk.

Engineers must slow up in passing stations when men are on the cage or bucket.

Here a lengthy combination of numbers is inserted indicating the several levels from the first to the twentieth.

If a cage is wanted, ring station. Station tender will respond in person.

If station is full of ore and station tender is wanted, ring station signal.

One copy of this code shall be posted on the gallows-frame and one before the engineer.

The first signal (one bell to hoist, or stop, if in motion) is in common use almost everywhere, and cannot be improved upon, but the signals "two bells" lower men and "three bells" hoist men are defective as giving no premonitory warning, and make no distinction, so far as indicated by the published code, between men and materials. A better signal for lowering men is 3-2. This indicates that there are men to be lowered, whether it be from the surface or from some level to a level below it. If men wish to descend to any particular level, that level should be rung first, then 3-2. A hoisting signal for men which has had years of trial is 3-1, or, hoisting with men from a level to any one above, the level first, then 3-1.

The clause requiring the engineer to slow up upon approaching each level seems superfluous and is prohibitory to rapid winding where large tonnage is hoisted daily through a single shaft, and would be unnecessary in a well-constructed shaft where there is competent and experienced management. The provision that the signal code shall be posted in the engine room and on the gallows-frame at the collar of the shaft should include the station at each level of the mine. It seems unfortunate that the signal code is not uniform throughout the United States, as then miners, who are migratory, would be familiar with it, no matter in what district they might be employed.

In this connection it is interesting to note that the necessity for a uniform code of mine bell signals has been recognized by the Legislature of Montana, which adopted a resolution suggesting a conference of the Governors of the several mining States, with a view to establishing a uniform signal code for mines throughout the United States.

IN these days of modern, careful, painstaking engineering practice, there is no excuse for building a quartz mill not well adapted to the treatment of ore to be handled in it, when it has been determined what process is best adapted to the ore; still it is not an uncommon thing to see men shoveling ore into a breaker sitting a foot or more above the ore floor; grizzlies so arranged as to feed to the end of the mill; illy constructed battery frames; belts running in the wrong direction; retaining walls to hold loose rock when bedrock foundations were as easily and less expensively obtainable. These and other mistakes of construction and unfortunate selection of site, where better could be had, are of common occurrence.

THE Treasury Department, Washington, D. C., has given notice that it will buy \$2,000,000 worth of silver bullion, to be coined into 5,000,000 pesos, for use in the Philippine Islands. This bullion will be bought at market rates.

Tin Mining in the United States.

Tin production in the United States has never assumed importance, though several efforts have been made to develop tin mines in widely separated regions. In 1885-86 development of the tin prospects in the Harney Peak region of South Dakota was active and a large mill was built at the Etta mine, near Harney City, and subsequently a great amount of money was expended in the acquisition and development of tin prospects in the region about Hill City, a few miles from the Etta mine. After an active existence lasting two or three years these mines were closed, since which time little has been done attracting the attention of the outside world. In 1890-91 an English corporation known as the San Jacinto Estate expended a large sum in the erection of buildings, reduction works, roads and water privileges in Riverside county, Cal., and sank two shafts, each about 300 feet in depth, connected by a level. The total outlay for labor and improvements is stated to have largely exceeded \$500,000. About twenty tons of tin was produced and sold, and the metal was reported to be of superior quality. Operations ceased at this place and no important development in tin has since been reported in the United States, until the announcement of the discovery of cassiterite in the Santa Ana mountains, in Orange county, Cal., where considerable development has since been done on the tin-bearing veins. This district is only a few miles distant from the property of the San Jacinto Estate. In the Black Hills of South Dakota a new company has been recently organized to develop tin prospects in the Bear Gulch region, where tin is known to occur in veins.

The fact that no tin has ever been produced in the United States at a profit does not argue that tin veins may not be developed which will yield a profit. The tin mining industry requires the same experience, technical knowledge and skill that any other branch of mining requires, if not more than some others, and the fact that the industry is new in this country and not as well understood as elsewhere may in a measure account for the repeated failures in establishing a permanent industry.

Employers' Organizations.

As a natural result of the repeated demands made by organized labor throughout the country, not only in mines and metallurgical establishments, but in commercial and manufacturing industries as well, employers are organizing for defensive action, legislation and protection in any form that may be demanded by the situation. The structural iron manufacturers have recently organized for this purpose. This organization will be known as the Structural Iron Manufacturers' Association. This step has been taken in view of the report that the iron workers intend to make an organized demand on May 1 for an increase of wages. The newly formed California Mine Operators' Association was organized for a similar purpose. The latter organization passed a resolution at its meeting held in San Francisco, Cal., March 25, to the effect that the members of the Association, in the employment of workmen, would not discriminate against non-union men. The association of employers will undoubtedly have the effect of either deterring workmen from making unjust demands, or aggravate them into making increased demands by reason of opposition. With organization of both employers and employees, arbitration seems the only rational solution of labor difficulties which may occur hereafter.

In line with this idea Gov. Peabody of Colorado appointed an advisory board to consider the causes which have led up to the strike in Cripple Creek, Colorado City and elsewhere in the State, hearing both sides of the controversy. At a meeting of the board held at Colorado Springs, officials of the Western Federation of Miners stated that the chief cause for the strike against the mills at Colorado City was the discharge of men because they were members of the union.

IN the case of the Argonaut Mining Co. vs. the Kennedy Mining Co. of California, which was recently decided by the United States Supreme Court in favor of the Argonaut Co., the Kennedy Co. have filed a petition asking for a rehearing of the case.

CONCENTRATES.

IN litres—metric system—a British gallon (277.274 cubic inches) would equal 4.543 litres; an American gallon (231 cubic inches), 3.785 litres.

WITH the barometer standing at 22.8 inches the atmospheric pressure per square inch would be 11.19 pounds, indicating an altitude above sea level of 7610 feet.

A 10-INCH sheet iron pipe .12 inch thick would weigh sixteen pounds to the lineal foot, and at a velocity of 10 feet per second would discharge 308 cubic feet water per minute.

ALL tunnels, drifts and crosscuts should have good grade, and a clear ditch either at the side or underneath the track for drainage. There is no economy in having a wet, sloppy level.

IT IS rarely that a millman is justified in using a steel chisel on amalgamated plates, though it is sometimes done where the amalgam is abundant and hard, leaving a good coating still on the plate.

A CANADIAN PATENT is good for eighteen years, but the patent must be used or worked or put in practical use within three years from the date of issue. The time may, however, be extended for cause shown.

THE proper place for a belt shifter is on the slack side and near to the driven pulley. The shifter should be provided with two rollers, twice the length of the width of belt, and set on an angle of 75° with the center line of the belt.

BARIUM ALUMINATE in solution of a density 4° or 5° Baume is useful as a preventive of boiler scale. The barium aluminate combines with the sulphate of lime and carbonate of lime, forming neutral and insoluble barium carbonate.

ANTHRACITE COAL does not occur abundantly, as far as known, outside of Pennsylvania. Its occurrence is reported in Rhode Island, near Providence; at Crested Butte, Colo.; at Cerrillos, New Mexico; in Washington, and near Banff, B. C.

JASPER sometimes contains gold or silver when in a mineral zone or vein. It is usually the result of the metamorphism of shales or slates, or is the result of a segregation of silica in limestone. In the latter case the rock is known as chert.

A CEMENT FLOOR is advisable in a quartz mill beneath and about the plates. A floor of this description is easily kept clean, and all escaping quicksilver and amalgam may be recovered by washing into a small basin or launder to which the floor drains.

IN mining or merchandising or any corporate enterprise overcapitalization does not mean large capitalization, but means the imposition upon an undertaking of a liability without a corresponding asset. It is thus a fraud upon those who contribute the real capital.

A 20% GRADE would be a rise or fall of 20 feet in every 100 feet—not on the slope, but measured horizontally; in this way a 100% grade would correspond to an inclination of 45°. A rise or fall of 1 foot vertically in 20 feet, measured horizontally, would be a 5% grade.

DARK STRAW COLOR is a proper shade for the temper of drills in hard rock and blue for picks. Tempering of mine steel requires experience and judgment on the part of the blacksmith. Too high a heat in the forge will "burn" the steel and render it unfit for use, as it cannot be easily retempered.

WHERE the opening is 16 inches long and 4 inches high, and the head of water is 4 feet: $16 \times 4 \times 4.18 = 267.52$ —the number of cubic feet of water passing through the opening per minute. With the same head of water there would be discharged from an orifice 1 inch square 4.18 cubic feet per minute.

MINE SWITCHES underground should be well constructed and fitted in such a manner that the trammee need not be required to stop or slow up unless it be necessary to turn the switch. Switches so poorly made that cars are frequently derailed in passing are more expensive than one of much greater original cost.

A PROSPECTOR is not permitted to enter a millsite for the purpose of prospecting, but a vein found outside the millsite and extending through it may be located to take in the millsite. In the event of an adverse the character of the land in question must be determined by the Land Department and not by the courts.

THE recording of mining locations is not required by the United States statutes, but, where State or local district laws make recording a requirement in location, it is imperative. A claim which superficially shows indications of value sufficient to justify even preliminary development, is worth recording, whether the mine be in an

organized district or not. Too much care cannot be taken in securing a perfect title to the claim before its value is proven, as later when values are developed there is danger of trouble, which increases with the value of the mine.

THERE are two meanings to the term horse power in engineering. One, a unit or measure of rate of work, or work done in a specified time by any source of energy as a waterfall, steam boiler, a current of air, or water, by a prime mover as a water wheel, a steam engine, or wind-mill. This unit is 33,000 foot-pounds per minute.

PSILOMELANE is an ore of manganese. It has a hardness of 5 to 6 and a gravity of 3.7 to 4.7. It is brownish black in powder, but is iron black to dark steel gray in mass. The composition is doubtful, having a considerable range, generally impure from admixture of silica and other substances. Occurs with pyrolusite (the black oxide).

THE average percentage of copper in the ore mined in the United States would be difficult of determination, ranging from less than 2% in some of the Lake Superior mines to 60% and more in small lots of oxidized ore. The average grade of the ore mined at most of the large sulphide mines of Montana and Arizona is from 7% to 10%, though some mines are lower in grade.

AURIFEROUS CONGLOMERATES may be the result of wave action on a shore line, where the material composing the conglomerate was originally gold-bearing, or it may result from the consolidation of river gravels containing gold. The cementing material may be silica, clay, carbonate of lime, iron or the fine detritus derived from the disintegration of the original material.

AN acid is a compound of hydrogen, or hydroxyl, with a non-metallic element (as chlorine, sulphur, nitrogen, phosphorus, etc.), or a radical containing these elements. The hydrogen may be replaced in them by metallic atoms, the result being then the formation of a salt. As an example of the latter may be taken calcium hydrate and sulphuric acid, which gives calcium sulphate and water.

METEORITES—real meteorites—are valuable. Specimens from some localities will bring a higher price per ounce than gold ore. The genuine meteorite can be told by placing nitric acid on the polished surface of the specimen; if the peculiar etched surface appears, it is the real meteorite, and some museum or collection wants it. Specimens that come from unusual localities are more valuable than those found in known fields.

THE rarest of all specimens in mineral collections is platinum in nuggets of any size. Most public collections exhibit platinum in flattened grains, but seldom in anything beyond a few-grain nugget. Most of the museums show models of large Russian platinum nuggets. The largest nugget of platinum ever discovered is said to have been found in a Russian platinum mine, it weighing 21 pounds troy. Nuggets weighing up into the pounds rarely find their way to mineral collectors in this country.

FINE GOLD may be saved in sluice boxes by employing what is known as quarter-sawed cedar boards, which should be placed in the bottom of the sluice the same as a slat rifle. The coarse material is cut out by use of grizzlies. The fine gold catches in the rough surface of the cedar boards, which are placed with the rough edge against the current. They may be quickly removed from the sluices and the gold recovered by inverting the board and pouring over it a stream of water.

NO. 1 NITRO POWDER contains 70% nitro-glycerine, No. 2 contains 40%. No. 1 is advised in hard, tough rock, and much less powder of the higher grade will frequently accomplish more satisfactory results than No. 2, as it is often necessary in hard rock to place so much of the No. 2 in a hole that the collar of the hole only is blown off, leaving two, three or more feet of the drill hole, which must be shot repeatedly until the ground is broken. No. 1 having much greater force, exerts it near the bottom of the hole, and usually accomplishes the desired result.

THE charges for milling ores in stamp mills vary greatly, depending on the character of the ore, and sometimes on competition. It may vary from \$2 to \$20 per ton, but \$2.50 per ton is the usual price for free-milling ores, special arrangements being usually made for large quantities. It is difficult to establish what percentage shall be guaranteed, as this may differ with the character of the ore, but with ore not too difficult of treatment in a mill thoroughly equipped with modern concentrating devices 85% to 90% should be expected. If the mine owner has a large amount of ore to treat it is sometimes more satisfactory to lease the mill and employ all the necessary hands.

BARITE (heavy spar) is found crystallized in but small quantities in the United States. Few specimens have been produced that will compare with the fine productions of the Cumberland, England, mines. A few years ago some prospectors in sinking a shaft for lead and zinc near Galena, Kansas, ran across a pocket of well-formed crystallized barites of bluish and white color. Not knowing the value of the find, the miners tossed the spec-

imens on the dump along with rock and dirt. A few were kept from curiosity and one, owned in Chicago, shows the blue barite crystals in slab form protruding from gangue, and, though less transparent than English specimens, yet is remarkable because of the locality from which it was taken. No other known find of crystallized barite has been made in the Joplin, Mo., district, though it occurs massive in some places there.

WHEN the quicksilver added to amalgam is poured off from the amalgam and the latter squeezed through a cloth or buckskin, there always remains some fine gold in the mercury which passes the cloth. This may be recovered to a great extent by pouring it into a 2-inch pipe about 12 inches in length, provided with a cap at the lower end, and having a small hole bored about 2 inches above the bottom. This hole should be plugged. After standing several hours the gold in the quicksilver settles to the bottom, when by removing the plug from the hole in the side of the pipe the mercury above it will run out, leaving the amalgam in the bottom of the tube, which may then be retorted without loss. Of course this is unnecessary when the quicksilver is kept in constant circulation in the mill, but is useful in final cleanup, or when it is desired to clean the quicksilver.

WHERE a person locates a claim and fails to perform the assessment work thereon as required by law, but only goes upon the claim and works a few hours, it has been decided by the California Supreme Court that "a party cannot hold a mining claim for several years without doing in any year the work required, by simply going in at the beginning of each year and doing a few hours' work, with no bona fide intent to comply with the statutory requirements as to the amount of work to be done. It is against the policy of the law, and a fraud against the Government and the law, to hold quartz claims by merely doing a few dollars' worth of work thereon at or near the beginning of the year next following the year on which the claimant failed to do the necessary work. Such labor is a pretense and a sham, and will not prevent the relocation of the claim for want of necessary work."

THE number of feet a machine drill can cut in competent hands in a shift of eight hours depends upon the character of the rock. In medium hard rock 45 to 60 feet is a good shift's work. This may be more or less, according to the condition of the ground as to fractures, slips, etc. A badly fissured ground gives more trouble than a massive, homogeneous rock. The pressure of air at the drill is also an important factor. Not less than ninety pounds per square inch should be employed on hard rock. The drills do not last as long, but they do far more work than at lower pressures. There is much difference of opinion as to the relative merit of machine drills and hand drills in shaft sinking. It is generally conceded, however, that machine drills usually make better headway, but at increased expense. By either method a premium system of payment accomplishes the most satisfactory results.

IT would often pay a mining company to give its foreman or superintendent a three months' leave of absence under full pay, and all travelling expenses audited, and let him wander around a little. It sometimes happens that when a mine foreman or superintendent stays a long time in one place without the educational advantages of travel that he gets to fancying he knows it all, and the particular hole he is in is so exactly the center of the universe that the horizon comes down equally on all sides of it, and that when he dies wisdom dies with him. When one gets that way he is about fat enough to kill. Everybody is wiser than anybody, and no matter how experienced or wise or clever one may be he can learn something by a visit to the next mine, or county or State. If he has set in one little groove for ten or fifteen years he cannot realize how narrow he is or how far behind his broader minded fellows who travel around. It would pay him and pay his employers to take a tour of observation, for every real progressive miner will die learning, and when one ceases to learn he is dead, even if he doesn't know it.

THE relative merit of belt concentrators and shaking tables must be determined by experiment on the ore to be treated. The mistake is usually made with both types of these machines in the endeavor to concentrate both coarse and fine sulphides on one machine. This is physically impossible, as the size of particles of sulphide mineral will vary from the coarsest that will pass the screen, say 30 or 40 mesh, to those that will readily pass a 200-mesh. It is not reasonable to expect any sort of concentrating machine having a uniform grade, given amount of water, and traveling at a stated speed with the same number of vibrations, to make a clean separation of these extremes in sulphide particles from any sort of gangue. Hydraulic sizers, or classifiers, should be employed to separate the coarse from the fine material. Where this is carefully done in some instances the canvas plant may be dispensed with. Tailings sometimes contain values which cannot be caught on concentrating machines or on canvas tables. In this case the gold is usually still imbedded in the grains of gangue mineral (generally quartz) and can only be freed by finer crushing. It then becomes a question of economics—will the additional saving resulting from fine crushing be justified by the increased cost by reason of decreased stamp capacity?

Graphic Method of Mapping Exposed Ore Bodies.

Written for the MINING AND SCIENTIFIC PRESS by G. W. MILLER, E. M., C. E., Butte, Mont.

If the metalliferous substance contained in mineral-bearing veins, or deposits, cannot be profitably extracted and their metals reduced and marketed at a profit, such substances cannot in a technical sense be

terial consumed, etc., are deducted from the gross value of ores (the unit used generally being expressed in cost per ton of 2000 pounds). It is not the object of this paper, however, to discuss these latter points, or to deal with negative quantities, so much as it is desired to add a small mite to assist in bringing about a more uniform system of sampling, and estimating the quality, quantity and gross value per ton of ore in mines. For this the following method is proposed:

METHOD.—This method has been tested and used quite extensively and with entire satisfaction by the writer, both in this country and in South Africa, and it has been found especially adapted for ore deposits lying in continuous sheets, or those of the fissure vein, contact, or bedded types.

This method necessitates four distinct operations, viz.: (a) Surveying and mapping the mine; (b) taking samples of the ore; (c) assaying samples and determining their specific gravity; and (d) estimating number of tons and gross value of ores and tabulating results.

SURVEYING AND MAPPING.—The first step to be taken in this operation is to make a fairly accurate but rapid survey of all underground and surface workings of the mine. From the data of this survey maps of the mine are prepared (if not already at hand). If the mine contains but one vein, one plan of underground workings, one or more cross-sections, and one graphic drawing is required, but if the mine consists of more than one regular ore vein, one graphic drawing, in addition, must be made of each vein, or separate ore body, or deposit. The accompanying drawings illustrate an ideal mine of one ore vein. Fig. 1 is the plan, Fig. 2 a cross-section, and Fig. 3 a graphic representation of the vein surface. The plan and sections are first prepared on a scale of 20 feet to the inch. The lines R—S, S—T are then layed off on the plan. S—T is made parallel to the general course or strike of the vein, and R—S at right angles to this, in a direction parallel with the general course of dip. To construct the graphic map (Fig. 3) on the same or separate sheet of paper draw several lines, viz., R—S, S—T, and lay off on R—S, the slope distances of each level, and the point of intersection with the surface at "X." Now the contorted sheet, or warped surface of the vein, is developed into an inclined plane by straightening out horizontally each drift until they are at right angles to R—S.

Lay off all shafts, winzes, stopes, etc., as shown in the drawing by taking the meandering distance of each from the line R—S, or the horizontal distance of each point as determined by making measurements on horizontal planes along the strike of the vein. This will cause the straight winzes, upraises, etc., to present a somewhat zigzag appearance; this is, nevertheless, the most simple, and at the same time correct drawing that can be made which will represent the true plane of any warped vein. The intersection of this plane with the surface of the earth will appear along lines following the general undulations of the vein outcrop. The distance, for instance, from the first level to the surface, or to the points B, E and G, are equal to the distances measured along the slope from the first level at the points d4, d9 and d22. Commencing on the bottom workings, at the points on the drawing 1, 2, 3, 4, etc., the drawing is divided (where the edges of the ore body are exposed for sampling) into spaces of 5 feet, and the point where samples of the ore are to be afterward taken are indicated by placing opposite each point the sample number. These numbers should follow each other in the order 1, 2, 3, 4, 5, etc., as nearly as possible. (See Fig. 3.)

The shaded sections shown will be described later.

Having completed the maps of the mine up to their present requirements, it is in order to begin the operation of taking samples of all ores exposed in the mine workings and upon the surface outcrop of the vein.

TAKING SAMPLES OF THE ORE.—In beginning this work it is generally better to sample the drifts first, afterwards the winzes, shafts and upraises; next the stopes, and lastly the surface workings and vein outcrop. In following out the present system it has also been found best to make, first, a somewhat hasty preliminary sampling of the entire mine, taking samples at long intervals, say at 25 feet, 50 feet, or in some cases at even 100 feet apart, or at points where the ore body is most prominent.

These samples are assayed and their results given particular cognizance before proceeding further with the examination. This preliminary sampling serves two important purposes:

First.—It serves as an excellent guide to go by in selecting the final samples.

Second.—It may prove the mine valueless and consequently not worth a thorough sampling. This preliminary step should be taken as the first step in the examinations, and in some cases, indeed, even before making a survey of the mine.

But the mine now in view presents an ideal example, hence, we shall not stop to consider the more general cases; suffice it, for the present purpose, to follow out in detail the course as outlined in the particular case under consideration. Samples are taken across the vein, i. e., at right angles to the strike and dip, beginning at No. 1 as shown on the map. The spaces of 5 feet each are marked off in the workings, the proper number being given to each sample, which should correspond to the numbers on the graphic drawing. Samples are taken 5 feet apart in all cases. All high-grade streaks are sampled separately, and only such ground as will pay to work is sampled. This should be done in the same manner as the ground would be broken and sorted in stoping. A book record of all samples taken is kept, which should give the distance of each sample point from

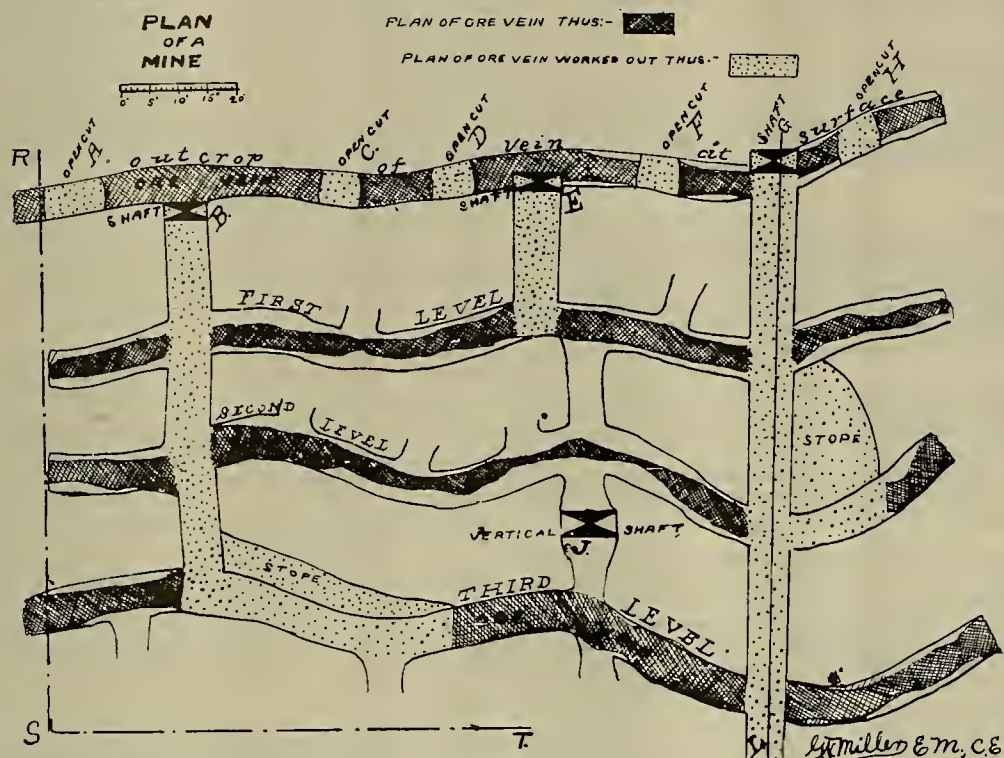

FIG. 1.

FIG. 2.

termed "ores." In the same sense neither can a mineral deposit be properly termed a mine, regardless of the extent of its development and other attending advantages claimed for it. On examining a mining property with a view of reporting upon its actual, or probable valuation, it is, therefore, of the utmost importance that the engineer, in the first place, determine from a thorough and systematic method of sampling the character and value of all ores exposed or in sight. Attention of its members has been recently called to these points by the London Institute of Mining and Metallurgy. The members of this Institute are instructed as follows:

First.—That the term "ore in sight" should not be used in reports without indicating the data upon which the estimate is based, and that estimates should be illustrated by drawings.

Second.—That "ore in sight," meaning ore blocked out or exposed on at least three sides within reasonable distance of each other, should be kept distinct from ores which may be reasonably assumed to exist, though not actually blocked out.

Third.—That in using the term "ore in sight" the engineer should show that this ore can be profitably extracted under the working conditions obtaining in the district. (See also my "Field Book of Practical Mineralogy," pages 25 to 33).

Keeping in mind the general text of the foregoing points it is obvious that with regard to mines in which the ore bodies have been blocked out, and on which a report is desired, the gross value of the ore thus exposed will in all cases form the fundamental basis for all subsequent considerations of the property as a profitable enterprise. This is apparent from the fact that all attending items of expense, such as cost of mining, reduction, transportation, interest on capital, repairs, ma-

some established survey point, together with a sketch showing the length, position and number of sample. The length of sample given in all cases, or wherever possible, is supposed to represent the full width of the vein measured at right angles to the plane of its dip and strike. From the shape of the exposed ore body these edges may not admit of taking samples directly perpendicular to the dip and strike; but as it is the width of vein which the samples are desired to represent, this distance and not the length of cut made in taking the sample is noted.

therefrom. The amounts selected should be from five to ten pounds of ore for each linear foot of trench; but, as the ores may vary much in specific gravity, in order to get uniform samples it is generally better to measure approximately the amount taken from each linear foot. This operation is best performed by an assistant catching the particles of ore as cut from the trench in a box or vessel suitable for the purpose, and estimating the proper amounts thus taken corresponding to each sample. The amounts taken

pose. This box should not be lost sight of at any time; it should be large enough to hold twenty-five 5-pound, or twelve 10-pound, samples.

Where the assays are to be made at a considerable distance from the mine, and the labor and cost of transportation is a consideration, the burden of excess weight may be lessened by successively quartering the samples down, using the same method universally employed in assay offices. So, if this work can be performed at the mine with the same degree of accuracy, matters may be greatly facilitated.

GRAPHIC ILLUSTRATION OF ORE IN A MINE

REVOLVED SECTIONS OF ORE TAKEN WHERE SAMPLED, AT RIGHT ANGLE TO PLANE OF VEIN: ORE STOPED OUT THUS:-

FIG. 3.

In sampling winzes, shafts, upraises, etc., and in some cases stopes also, where the vein is equally exposed on either side, half of the sample may be taken on one side and the other half on the side opposite. In such cases this would represent, from a series of samples taken, a perpendicular section through the center of the working (see incline shafts B, E, G, etc., on graphic drawing). All samples are taken as nearly as possible so that the volume of ore represented by each shall be proportional to the length of sample, i. e., to the width of vein at the point where the sample is taken.

The samples are taken by cutting shallow trenches across the edges of the ore body, and small particles of ore representing that remaining in place are taken

representing any one sample is dumped upon a heavy canvas and broken into smaller pieces; it is then quartered or halved, after a thorough mixing, and then repeating the operation until a small sample of the desired size is obtained. After this it is poured into a clean box or tin vessel, from which it is conveniently emptied into a small sample bag. The sample is now tagged on both inside and out with labels, bearing numbers identical with the one previously assigned to it on the graphic drawing and corresponding to the point from whence the sample was taken. The samples, after being prepared in this manner, in order to protect them from being tampered with, are securely locked up in a substantial tin, or light sheet-iron box, used especially for this pur-

ASSAYING SAMPLES AND MAKING SPECIFIC GRAVITY DETERMINATIONS.—As proof that painstaking precaution was observed all through the examination, and in order to guard against every possibility of being found in error (by some other engineer who might be called upon to check up the work from the data furnished, from start to finish, and with instructions to prove, if possible, the accuracy of each and every step taken in the present examination, by performing the work over again in a manner similar), it is generally more satisfactory for the engineer and his assistants to conduct in person the entire process of assaying and specific gravity determinations.

The methods used in this work should be fully explained and recorded. Duplicates of each pulped

sample should be labeled and stored away for future reference, to be used in case a check examination is ordered. The following method of specific gravity determinations has been used with advantage:

First.—Balance the specific gravity bottle on the scales; now fill to the brim with water, balance again, note the excess of weight added and call this A. This equals the weight of water in the full bottle.

Second.—Pour out a few drops of water and weigh again. Call this weight B.

Third.—Add the coarsely powdered ore until the water is again full to the brim; weigh and call this weight C.

Then, $\frac{C-B}{A-B} = G$, the specific gravity sought.

The necessity of mixing and grouping ores for specific gravity determinations is apparent, and the importance of this should not be overlooked.

ESTIMATING GROSS VALUE OF ORE AND TABULATING RESULTS.—Having obtained all necessary data for this, it is now in order to proceed with the last step of the work. This is done by first indicating upon the graphic drawing the position of each series of samples in profile sections. The bottom, or base of these sections, represents the lines from which samples were taken. The number of samples are those appearing along this line; the heavy lines drawn perpendicular to this represent the width of the vein at the respective points, while on the wavy line at top of the sections are recorded the gross value per ton of ore, in terms of whole dollars. It will be observed that the natural position of these sections is that with their planes standing perpendicular with the plane of the drawing, the positions shown in the drawing being that resulting from revolving each section upon its base line a2, a3, a— a3, etc., as an axis until the sections lie flat upon the plane surface of the drawing. The lines a1—a2, a2—a5, a5—a4, a4—a1, etc., outlining the plane base of the blocks of ore A, B, C, D, etc., are drawn as nearly as possible so as to group into separate blocks, and classify the ores of different grades or those which show uniformity in value.

The method of calculation is illustrated in tabulated form. (Fig. 4.)

Hence, $(a + h + c) V = ad + be + cf$, whence $V = \frac{ad + be + cf}{a + h + c}$.

Hence, rule: Multiply the area of each revolved section taken by its average assay value, add the products thus obtained together, and divide the sum by the sum of the areas of the revolved sections; the quotient equals the value per ton of the block.

TO FIND THE NUMBER OF CUBIC FEET OF ORE IN ANY BLOCK.—Rule: Multiply the area of its plan base by the sum of the average width of the revolved sections taken, and divide the product by the number of sections taken.

TO FIND THE NUMBER OF TONS OF ORE IN ANY BLOCK.—Rule: Divide the number of cubic feet in the block by 32 (there being 32 cubic feet in one ton of water of 2000 pounds) and multiply the quotient by the specific gravity of the ore.

Having the number of tons and value per ton, the gross value of ore recorded in the last column of the table is easily obtained.

Butte, Mont., March 1.

[Discussion in the MINING AND SCIENTIFIC PRESS of this and other articles of a scientific, technical or practical nature is invited.—Ed.]

Electrolytic Treatment of Arsenical Ores.

There is probably no gold-bearing ore which has been found as difficult of successful treatment in stamp mills as auriferous mispickel (arsenical iron sulphide). An extraction exceeding 40% of the assay value by the ordinary methods of amalgamation and concentration is unusually good. Much experimentation has been done on this class of ores.

What is known as the Westman process is described by the Electrical Review as having been successfully applied to the treatment of these ores, as follows:

It is claimed for the Westman furnace and process that not only is the danger from the escape of poisonous fumes lessened, but that the gold and silver present in the ore in small amounts are obtained in the residue in a form that leads to a profitable re-

Bear Gulch Tin District, South Dakota.

Written for the MINING AND SCIENTIFIC PRESS.

In the northwestern part of the Black Hills of South Dakota, and extending over into Wyoming, is a district of unusual interest, as in it occur mines of both gold and tin. The district was one of the first to attract the attention of early prospectors, who discovered the rich placers of Bear gulch, Potato creek and Nigger hill. The geology of the region is simple. The rocks are mica schist, mica, slate, and other crystalline varieties of Archæan time, intruded by dikes large and small of pegmatite of exceptionally coarse crystallization, greatly resembling those of the Southern Hills in the Harney Peak region, from which it is separated by a distance of 65 miles. The granitic intrusions of the latter region are in direct line with the Harney granites and they may possibly have a deep-seated connection. This is something that will, in all probability, never be determined, as any such connection would be at a depth so great as to be far beyond the reach of human possibility.

The gold in the placers occurred not only in the beds of the gulches and ravines of the region but also on the summits of the highest hills. Of these latter Nigger hill was the most noted example. This eminence is a comparatively smooth, flat-topped hill, from the east of which radiate several shallow "draws" or gulches. Bedrock was from a few inches to 4 feet deep, and in the alluvial was found coarse gold—not always on bedrock, but often some distance above it, and in some instances even in the grass roots, while in places no gold was found on the bedrock beneath. An ounce or more per day to the man was taken out by many with rockers and limited water supply in the first season's mining in 1876. These deposits, however, were quickly exhausted and attention was given to the deeper gulch placers. The miners were greatly hampered in their sluicing operations by the abundant occurrence of black sand and small pebbles of high specific gravity which filled the riffles and caused a loss of gold. For several years the true nature of this black sand was unknown, and being considered iron of no real value

FIG. 4.

In the first column of this table is recorded the letter numbers representing the plane base of the blocks of ore or plan of block; in the second is given the dimensions in feet; these dimensions generally represent trapezoidal figures, the top number of which equals the altitude, and the last two the top and bottom bases. In the third column is recorded the calculated area of the trapezoidal planes, or plan area of each block. In the fourth column is given the sample numbers indicating the length and position of sections sampled. Thus, 37—41, etc., means that the distances and values of that revolved section is used from No. 37 to No. 41, including all intermediate points; the numbers, 21, 24, 20, etc., appearing in the sixth column, equals the true length of the sections. Column eight gives their area in square feet, as calculated from columns six and seven, and column nine the average assay value of each. In the remaining columns the calculated value of blocks are determined as follows:

TO FIND THE EQUALIZED VALUE PER TON OF ANY BLOCK.—This is derived from the average values and areas of the revolved sections, which are taken to represent the thickness of any block, and is based upon the following principle: Let a, h and c, equal the separate areas of the revolved sections d, e and f, the average value per ton of each in their order, in terms of dollars, and V, the equalized value per ton of their sum. Then:

$$\begin{aligned} a \text{ square feet at } \$d \text{ per ton} &= ad \\ b \text{ " " " } \$e \text{ " " } &= be \\ c \text{ " " " } \$f \text{ " " } &= cf \end{aligned}$$

covery. The furnace is closed to exclude the air, and the heating occurs by means of an alternating current and cast-iron electrodes cooled by water. The arsenical ore is charged on to the hearth of the furnace, which is covered with a molten layer of lead, and any gold or silver present is dissolved out and retained in this bath of molten lead. The volatilized arsenic arising from the furnace is conducted away to a series of condensing chambers provided with partition walls and bottom doors, and it is condensed in these in the form of grey particles of the metal. The Arsenical Ore Reduction Co., of Newark, N. J., has been formed to work this process in America, and it was stated in October, 1901, that operations were about to be commenced with rich mispickel ore (arsenical pyrites) from Ontario, Canada. When operating with this ore the sulphur combines with the iron, and only the arsenic volatilizes. In the preliminary trials with the process it was stated that 1,270 kilowatt hours were required for smelting one ton of the ore, but this figure would appear to be a misprint for 1270 kilowatt hours. The development of the Westman process will be handicapped by the fact that the arsenic is obtained as metal, and that a further roasting operation will be necessary to obtain it, in the form of the white arsenic (As₂O₃) in which it is chiefly used in the arts and industries. Unless great care is exercised in choice of ores the product is also likely to be much contaminated with other volatile elements, of which sulphur, antimony, cadmium and zinc are the most common examples. However, in spite of these hindrances, the process may develop.

many tons of the troublesome stuff were dumped into the tailings piles in every gulch in the district. About 1880 the discovery was made that the heavy black sands consisted, in part at least, of cassiterite, and a search for the veins from which the stream tin came soon resulted in finding that it came from the intruded granite dikes. Tin stone was discovered about the same time in the Southern Hills in the Harney region.

These dikes vary in width from 3 or 4 feet to over 100 feet, and some of them outcrop continuously for more than a mile in length. The dikes are very interesting as they contain an unusual variety of minerals. The most important from a mineralogical standpoint are quartz, orthoclase and mica (muscovite) the essential constituents of granite. Associated with these are albite, apatite, hiotite, tourmaline (black), and numerous other minerals which occur more sparingly and are irregular in distribution.

Other minerals also are found which are chiefly interesting for their economic importance. These are gold, cassiterite, wolframite (iron-manganese tungstate), and columbite-tantalite (niobate and tantalate of iron and manganese). These minerals are all of high specific gravity and are found in the sluices.

Some of the larger granitic dikes are intruded by small, dark-colored dikes, possibly diabase. Beside the granitic dikes there are numerous quartz veins, and at the distance of a few miles are abundant eruptive rocks—rhyolite, phonolite, trachite, etc.

A large amount of gold has been mined in the district, but unless the gold-bearing veins and dikes be

came steady producers tin will probably form the most important economic mineral found in this corner of the Black Hills. Recently this district has again attracted attention and companies have been formed to mine for tin, though doubtless the other minerals will be given the attention their importance deserves.

W. H. S.

Copper Mining in Upper Michigan.*

NUMBER II.

Written by J. F. JACKSON.

The Quincy has shafts 5400 feet deep on the incline and is culmied to go 7000 feet. The Calumet & Hecla has a shaft 6000 feet deep. At intervals of 100 feet in depth, levels or drifts are run out to the right and left. They are, at first, only 6 or 8 feet in width by 7 feet in height. The drifts are connected from shaft to shaft at different levels, to give ventilation. To begin the work of developing a mine, it is necessary to install a temporary equipment. A head frame, an air compressor, and hoisting plant of small capacity are put in. If, as the work progresses, the mine shows promise of becoming a profitable producer, dwellings for employees, office buildings, machine, carpenter and blacksmith shops, rock houses and permanent compressor and hoisting plants have to be provided at the mine, and a stamp mill built to separate the copper from the rock. This is the era of development and requires from three to five years of time, and an expenditure of \$1,000,000 to \$2,000,000 to bring the mine to a point where it can produce 1000 to 2000 tons of rock per day. The underground development may, in this time, aggregate 3 to 5 miles of shafts, drifts, winzes, crosscuts, etc. All mining is done with air rock drills of the Rand or Ingersoll-Sargent type, and the miners generally work by contract in parties of four, two by day and two by night. They are paid by the lineal foot of shaft or drift. When the million or two dollars have been expended and the mine and mill are ready to begin regular production, the drifts are enlarged and "stopping" begins; that is, the miners begin at points where there are good showings of copper to work upwards toward the level, which is 100 feet above them on the incline. Stopping is paid for by the cubic fathom. The stopping is conducted at different mines according to different systems, which depend largely on local conditions. The rock which the miners break down from overhead by the use of dynamite is loaded into tramcars by trammers and pushed by hand or hauled by electric locomotive to the shafts where it is dumped into skips, which hold from four to six tons of rock, and are hoisted to the surface or rather into the rock house. In the rock house it is dumped over screen bars which allow the fine pieces of rock to go directly into the rock bins, while the larger pieces are broken in Blake crushers to sizes which will pass through a 4-inch opening. In the rock house waste rock containing no copper is thrown out, and pieces of mass copper from a few pounds in weight to a ton or more are freed from rock by a steam bammer and sent direct to the smelter.

A notable exception to the general way of opening a mine is found in the Red Jacket shaft of the Calumet & Hecla mine, and in the five shafts of the Tamarack mine. The Red Jacket shaft is 4900 feet deep. No. 1 Tamarack is 3240 feet deep, No. 2 is 4143 feet, No. 3 is 4713 feet, No. 4 is 4450 feet and No. 5 (4662 feet to the lode) is now 4980 feet deep. In this case the Tamarack does not own any of the outcrop of the Calumet lode, but the lode passes under its lands at great depth. One can imagine that it must have required some courage on the part of the projectors to sink the first deep vertical shaft to encounter a lode which might or might not contain copper at the point where intersected, or, later in the history of the mine to start No. 5 shaft, which should require five years of time and a million of money, simply to get down to the lode at a depth of 4662 feet with the hope of finding rich copper ground. A valuable paper by W. E. Parnall, Jr., on the sinking of this, the deepest shaft in the world, may be found in the seventh volume of "Proceedings of the Lake Superior Mining Institute." In the case of vertical shafts, the shaft intersects the lode at only one point, and the levels above and below this point must be reached by crosscuts of constantly varying lengths which run from the shaft to the various levels. When the shafts are vertical, the tram cars loaded with rock are hoisted to the surface on cages resembling an ordinary passenger elevator in a tall office building.

We will follow the copper rock a little farther and return to the subject of hoisting and hoisting engines later.

Supposing now that the waste rock and mass copper has been taken out in the rock house, and the stamp rock which constitutes the bulk of the rock hoisted from the mine to be crushed to pass a 4-inch screen, the stamp rock is loaded through chutes into drop-bottom ore cars and hauled in trains to the stamp mills located 5, 10 or 20 miles away on the shore of Lake Superior or some inland lake. Stamp mills are located on a lake not only to procure an

ample water supply, but also to obtain room to deposit the immense amount of sand which is made by crushing in each mill from 2000 to 6000 tons of rock per day. The 6000 tons of rock banded daily by the Calumet & Hecla mean 5000 cubic yards of sand per day, or 1,500,000 cubic yards per year. Its disposal, therefore, becomes an important problem. At the stamp mill the copper rock is dumped from ore cars into large elevated bins, from which it flows in a continuous stream by gravity into the mortars of the steam stamps. Water is admitted to the mortar at the same time and the rock is pulverized by blows from the steam bammer into particles small enough to splash through the perforated screens which surround the mortar. The size of these perforations varies from three-sixteenths inch diameter to five-eighths inch diameter. Each stamp mill will reduce to powder and sand about 500 tons of bard copper rock per day. About 4,000,000 gallons of water per day are required for each stamp head. The water and sand carrying particles of copper flow through separator boxes. The heavy particles of copper seek the bottom of the stream and are diverted from the main stream by adjustable valves. This portion of the flow containing most of the copper and some rock particles is then passed over a series of jigs where, by a gentle pulsing action produced by plungers, the copper settles on wire sieves and the rock particles pass over into the waste launder. The finer grades of copper are removed from the main stream which leaves the separator boxes by means of huge round slime tables or by Wilfley tables. The principle in all these washing or concentrating machines is that the heavy particles of copper settle to the bottom on being agitated, while the sand, having less specific gravity, is washed away by the flow-

Hoisting Engines at No. 5 Shaft, Tamarack Mine, Michigan.

ing water. The waste launders carry the sand and water several hundred feet to the lake where it is dumped.

The 1%, 2% or 3% of "mineral," which is the name applied to the product of the stamp mill, is next shipped to the smelters, usually only a few miles away. At the smelter this mineral, now 60% to 80% pure copper in the shape of small grains, together with the solid chunks of mass copper from the rock houses, is reduced in reverberatory and cupola furnaces. The principal flux used is limestone. During the process of refining, green poles are thrust into the molten metal. This process is called "poling," and tends to bring impurities to the surface where they are run off as slag. When the refining has been completed the molten metal is dipped from the furnaces and cast into ingot, cakes and wire bars, as may be required. Copper for wire bars and for cart-ridges must be of very great purity, tensile strength and conductivity. Copper from the Calumet & Hecla, Osceola, Quincy and Wolverine mines is particularly adapted for wire for electrical purposes. Lake copper is usually quoted one-fourth cent per pound higher in the Eastern markets than the electrolytic brands from the West. Western brands go largely into copper sheets, tubes, brass castings, bronzes, alloys, coinage, etc. There is a wire mill in our district from which quantities of wire of all sizes are shipped direct to consumers. Copper for electrical purposes is refined until it contains less than .1 of 1% of impurities.

It may be conceived that for a single mine to break out and hoist from a mile below the earth's surface a daily product of sufficient rock to fill a train of heavy ore cars $1\frac{1}{2}$ mile in length, and to transport the 7000 tons of rock to stamp mills; to pulverize the same to fine sand by steam bammers, and to separate the copper therefrom, must require the expenditure of considerable energy and that problems of great engineering interest must have been met and solved during the development of the business to its present proportions. There are now employed at the Calumet & Hecla 5000 men, at the Tamarack 1500, at the Osceola 600, at the Quincy 1000, and fewer at

the smaller mines. The aggregate number of employees in Houghton county is about 14,000. The yearly product is about 200,000,000 pounds of copper, of which the Calumet & Hecla produces 90,000,000. Having given a crude description of the general process of producing copper, I will now call attention to a variety of accomplished facts which may be of some engineering interest. In the first place, taking a trip to the bottom of a mine on the incline track or down a vertical shaft is not without a tinge of excitement to the inexperienced traveler. Arriving at one of the bottom levels, however, you find yourself in a dry and comfortable tunnel, which you can explore without inconvenience. The temperature is about 85° F. and increases 1° for each 112 feet in depth. You note how rock is broken from the stopes by miners, loaded into tram cars, pushed or hauled to the shaft, and dumped into skips, which run in balance on parallel tracks—that is, the empty car goes down while the loaded one goes up. One cable winds on the under side of the drum, while the opposite one unwinds from the upper side, and vice versa. You are told that the skips are hauled up at the rate of 40 or 50 miles an hour, and you hope your car will travel a little slower and wonder whether the 1½-inch cable will break or the car jump the track while you are going to the surface. Arriving at the surface safely, you naturally want to take another look at the hoisting engine which operates the skip, and find that the drum on which the cables are wound is 26 feet in diameter and 16 feet long, and that it is turned 40 revolutions per minute by two 48x84-inch engines attached directly to cranks at each end of a 16-inch shaft, upon which the great drum is mounted. Brakes and reversing gear are all operated by

steam. One man has perfect control of the entire machine and obeys signals conveyed to him by bell wire from the mine. A description of the first great Quincy hoist may be found in Engineering News of April 18, 1895. Its nominal horse power is 2500. Should you go down the 5000-foot vertical shaft, known as Tamarack No. 5, you would learn some new facts of interest. When the shaft was completed about two years ago, and it became necessary to bang plumb lines in the shaft from which to start the underground surveys, fine steel piano wires and 48-pound bobs were used. The wires stretched several feet, but were adjusted to length. They did not come to rest readily, so a vessel of water was placed underneath for the bob to swing in. When this was done it was found that owing to the buoyancy of the water a new adjustment had to be made. On coming to rest, or nearly so, it was found that the wires were 1 inch or so farther apart at the bottom than at the top of the shaft. When this fact became public a number of scientific gentlemen began to construct theories of the attraction of gravity and magnetic currents to account for the phenomenon. After some months of very thorough investigation by President McNair of the Michigan College of Mines, the fact was revealed that the divergence of the wires was caused by air currents in the shaft and not by gravity or magnetic currents. Another curious fact was also brought out by President McNair. He suspended a polished steel ball 2 inches in diameter at the top of the shaft by a thread. A man was stationed in a safe place in the bottom with a telephone and a stop watch. The thread was burned off and the man below notified at the same instant. They wanted to find out how long it would take the ball to fall to the bottom. The man below waited, but heard nothing whatever of the ball. It never reached bottom. On inquiring, President McNair was informed that particles of rock dropped into the shaft at the top seldom reached bottom, but lodged among the timbers with which the shaft is lined. The explanation of this phenomenon is found in the fact that the earth revolves on its axis with a greater velocity at the surface than at a point 1 mile below.

Those who are curious about this matter may figure it out for themselves.

(TO BE CONTINUED.)

German Copper Consumption.

Following are the figures of the German consumption of foreign copper for January, 1903, compared with the same period of 1902 and 1901:

	1903.	1902.	1901.
Imports, tons.....	6,829	4,469	6,534
Exports, tons.....	795	860	775

Consumption of foreign, tons. 6,034 3,609 5,759

With a head of 132 feet the equivalent pressure would be 57.16 pounds per square inch, and the corresponding theoretical horse power would be 3.34.

*Trans. Jour. West. Soc. Engrs., condensed.

Witwatersrand Gold Fields.*

The Witwatersrand gold fields are located on an elevated plateau, nearly 6000 feet above the sea. The Witwatersrand (or white waters ridge) projects somewhat above the plateau, and the outcrop of the conglomerate reefs can thus in a measure be said to be the dividing watershed between the Atlantic and Indian oceans, the tributaries of the Vaal river draining into the Atlantic and those of the Limpopo or Crocodile river to the Indian ocean. The conglomerate beds of the Witwatersrand are composed of quartz pebbles bound together by a siliceous cement containing iron pyrites. The name "banket" has been given to the conglomerate from its general resemblance to an almond sweetmeat with this Dutch name, which, however, refers specially to the ore taken from the oxidized zone, which in the early history of the fields was called "free milling," and found to extend to only a limited depth. The gold contained in the conglomerate is not often visible to the naked eye, occurring almost invariably in the matrix, its existence in the pebbles having been recognized only in rare instances. The gold is for the most part in very fine particles, and when examined under the microscope shows sharp crystalline structure, giving no evidence of being rounded and moulded by attrition, as is observable on examination of gold found in alluvial deposits. There are several series of these conglomerate beds in planes more or less parallel to each other. The most common designation of them, starting from the lowest geological horizon, is as follows: Du Preez series, Main Reef series, Bird reef, Kimberley series, Elsherg and Black reefs.

Exploitation has proved that the reefs where steeply inclined at and near the outcrop have a tendency to flatten in depth; and, conversely, where the outcrop region shows an abnormally low angle of inclination there is generally an increase in the immediate dip region, thus indicating a probability of approximation to uniformity of inclination in the deeper levels throughout the whole area. Gold is found as an essential constituent in all the banket beds included in the foregoing list, but thus far the Main Reef series has chiefly justified extensive exploitation, and even here only within certain limits.

WORKS OUTSIDE MAIN REEF.—Besides the companies whose production is connected with the Main Reef series, twenty-eight companies have worked on the Du Preez, Kimberley, Steyn estate, Elsherg and Black reefs. Some parts of the Heidelberg district, such as the Nigel, may be considered to be on the southern rim of the syncline of the Main Reef series, and six producing companies have operated here.

The production from the foregoing miscellaneous sources, aggregating \$15,169,601, may be summarized as follows:

Series.	Number Operating Companies.	Gold Produced.
Northern quartzites.....	2	\$ 5,407
Du Preez reef.....	3	5,260,754
Kimberley reef.....	7	340,449
Steyn Estate reef.....	1	245,895
Elsherg reef.....	1	848
Black reef.....	14	2,834,286
Heidelberg District—		
Nigel reef.....	5	6,274,329
Heidelberg Roodepoort mine.....	1	207,633
Totals.....	34	\$15,169,601

EXTENT OF THE FIELDS.—The distance along the strike of the reef from Randfontein on the west to Holfontein on the east is 62 miles, throughout which extent the reef has been almost continuously traced. Of this area, the central section for a distance of about 12½ miles has produced about 76% of the gold won. Conglomerate beds have, however, been traced over a far greater area, and correlated by geologists with the Witwatersrand series. It has been stated that there is continuity proved by outcrops and borings for 16½ miles, continuity concealed by more recent measures for 123 miles, continuity interrupted by faults and dykes for 31 miles, making a total of 308 miles.

As the subject of the genesis of the conglomerates and gold contained therein is open to much difference of opinion among geologists and engineers, it will be unprofitable to attempt to deal with it in detail. The most generally accepted theories seem to be that the conglomerate beds and enclosing sandstone and quartzites were seashore deposits formed during subsidence of a coast line; that after their deposition and consolidation the banket-bearing strata were folded into anticlines and synclines. North of Johannesburg subsequent erosion removed the anticline. The deposition and erosion in connection with the syncline have been such that a statement of a basin-shaped deposit has much justification. The beds have been subjected to fault and dyke action, which has broken them extensively in places.

DEPOSITION OF THE GOLD.—The origin of the gold within the beds can be considered as: (1) prior to the formation of the conglomerate; (2) contemporaneously with the formation of the conglomerate;

(3) subsequently to the formation of the conglomerate. The advocates of (1) assume that the gold and pebbles alike are the products of erosion or denudation of an older formation containing quartz veins; (2) requires the hypothesis that the sea was very shallow and contained a saturated solution of gold and iron sulphide, coupled with precipitating agencies; (3) this is the impregnation theory, assuming the gold and pyrites to have been deposited in the beds by infiltrating solutions, the mineral solutions seeking the planes of least resistance—i. e., filter bed of the banket, the deposition of the gold and other metals being thus brought about as in quartz veins. This latter theory is the most accepted by engineers here.

REEF CHARACTERISTICS.—The classification of the Witwatersrand beds seems a simple matter when looking at any one section, but in reality is complex. Even in the Main Reef series there is great variation in the number, distance apart, and thickness of the beds, and there is much diversity of opinion regarding their correlation, on account of extensive and complex faulting, especially in the extreme eastern and western sections. The value of banket ore cannot generally be gauged by mere inspection, and, to establish the average gold contents in the ore comprised within a given area, very elaborate systems of sampling are introduced, which involve the careful sectioning of the reef at 5—or at most 10—foot intervals, and the application of the law of averages. The necessity for these careful methods arises from the fact that the gold contents of the reef fluctuate sharply, as from point to point, and accordingly the average value can be arrived at only by the introduction of a mathematical scheme of averages. The existence of pyrites might be thought a good index, and as a general indication this is favorable, as gold is rarely found in the banket unless associated with it; but, on the other hand, pyritic impregnations are frequently found containing little or no gold. The pay banket may vary in thickness from a few inches to 15 or 20 feet. The encasing rock may be soft sandstone or hard quartzite. The dip of the beds may vary from vertical to horizontal. The mine may be wet or dry. The depth from which ore is hoisted may vary from 100 to 200 feet up to that of 2000 to 2500 feet. The amount of waste rock—that is, quartzite or other rock containing little or no gold, which is dislodged by blasting operations—that is sorted out from the reef proper varies between nothing and 40%. This process of sorting out as practiced here amounts simply to the rejection of valueless material. The mining ores may be a home for faults and dykes, or the reefs may be found free from serious disturbances. Thus it is unreasonable to expect uniform cost of extraction—when comparing one mine with another—any more than uniform yield. The great reputation these fields justly have for security and regularity is in gold mining merely relative and based on the law of averages. Gold mining as a business in other parts of the world has been recognized as the acme of speculative investment. Here, though capricious as units, the mines are as a whole regular, within certain fixed limits, and it is perfectly true that greater reliance can be placed on the continuance of the deposits than has ever before been known in gold mining, and therefore large preparatory outlays on the basis of a staple industry are more justifiable.

EFFICIENCY OF WORKING.—Up to the time of the discovery of the Witwatersrand deposits no auriferous conglomerates had been worked on a large industrial basis in any part of the world. At the start, therefore, these fields were unique as to general experience, and consequently the engineer had to grope his way, and the capitalist had to follow cautiously or risk rashly. One of the early difficulties was the unsatisfactory extraction of gold from the ore. At first not more than 50% to 60% was obtained by the amalgamation process. Later on concentration and chlorination of concentrates improved matters, but it was not until the chemical treatment of all the sands and slimes by the cyanide process was introduced that satisfactory results in this regard were reached. Now it may be said that the average well-equipped mine can recover 85% to 90% of the gold contents of its ore. The investor has gradually realized that, in order to secure the best results and put his property in a position to make profits with the low-grade ore, a large amount of development work, big mills, cyanide works and great capital outlays in many directions are required.

It has been estimated that on an average it must have cost companies at the rate of about \$25,000 per stamp for development work and all capital outlay connected with their mines. There have been at least 6000 stamps erected on these fields, which would make the total capital outlay for producing companies figure at about \$150,000,000. This makes no allowance for non-producing companies, or for the great outlays in Johannesburg in connection with central administrative control. A check on this estimate is shown by examining the capital expenditure for sixty-eight companies, when it is seen that on a stamp basis this works out at \$23,217.

A CUSTOM MILL in a district of small mines can often make success possible if the proper relations exist between the miners and mill owners, and

where, if the mines were each equipped with a mill, failure and idleness would result. To this end the mill owner should make a fair and equitable charge, returning to the miner as high a percentage of the values in his ore as can be extracted by a process suited to the ore. In this way several small mines may supply sufficient ore to keep a good-sized mill in constant operation where any one mine in the district would be unable to produce enough ore to steadily employ a small mill.

Lunkenheimer Mechanical Oil Pump.

In the illustration of the Lunkenheimer mechanical oil pump it will be noted that the driving mechanism is of the ratchet type and is operated by the clutches F and N that work co-operatively by the motion of the rod J, which can be attached to the eccentric rod, or other moving parts of the engine, by the couplings K and M. The motion thus obtained is transmitted to the piston E by the crankpin mech-

Mechanical Oil Pump.

anism H and G. The ratchet wheel D is provided with a handle whereby it can be rotated by hand in case it is desirable to force a quantity of oil at any time, as, for example, when starting the engine.

By moving the part K up or down the rod the stroke of the pump can be lengthened or shortened, as desired, thus regulating the amount of oil fed by the pump, independent of the feed from the oil cup. The joints of the cup are tight, the sight-feed glass being packed so as to prevent the access of air that would have a tendency to cause the cup to feed after the engine had ceased running. This construction and the use of check valves in the pump prevent oil supply from flooding.

The outlet C is piped to the steam pipe or chest of the engine, and the spring check valve X should be placed as near the end of the pipe as possible, preferably into the steam pipe.

The bottom of the pump body B is tapped ½-inch pipe thread to receive a stand so that it can be placed wherever desired. The ratchet wheel D and pawls F and N are made of tool steel, tempered and hardened. All other metal parts about the pump are hard bronze composition.

This oil pump is manufactured by the Lunkenheimer Co., Cincinnati, Ohio, U. S. A.

The Bingham District, Utah.

The report of the United States Geological Survey on the areal and economic geology of the Bingham Canyon district, Utah, by A. Keith and J. M. Boutwell, is now nearing completion. It embodies four main parts, which are devoted to history and development, surface geology, economic geology, and detailed descriptions of mines. Bingham is the oldest camp in the State, and the only one in which placer mining proved successful. In the discussion of the development, methods of mining and plants for reduction are described.

The text on the surface geology includes descriptions of the formations, their strike and deformation or faulting, and the porphyry intrusions, and are elucidated by means of a colored geological map and by structure sections. The economic portion gives a statement of the general characteristics of the ores and a detailed description of each species of mineral among those constituting the ores, and contains a discussion of ore values. The study brings out several new points of commercial value. A chapter on auriferous gravels deals with the history of this branch of mining, the distribution of pay, and the origin of the deposits, and closes with a discussion of future possibilities.

A detailed description of the underground geology of each property is presented, with illustrations showing their characteristic features.

This report will probably go to press early this summer, and, when published, may be obtained upon application to the Director of the United States Geological Survey.

Another interesting publication will be the Topographic Map of the Bradshaw Mountains, Arizona. It covers an area of about 1000 square miles, lying between Prescott and Phoenix, and includes a large part of the Prescott forest reserve. It is on a scale

*Abstract of report on gold mining industry of the Rand for the Chamber of Mines.

of about 2 miles to 1 inch. Elevations above sea level are given in figures to the nearest foot for all important mountain peaks. Elevations of other points are shown by contour lines, representing vertical intervals of 100 feet. All important mines, all roads and towns, as well as each detached house, are accurately located. These maps are sold at the nominal price of five cents each.

The development of this region has been retarded by the high cost of transportation and the scarcity of water. A railroad line now under construction from Mayer to Crowned King, with numerous spurs, will reduce the transportation cost.

Rolling Toggle Crusher.

The Krom rolling toggle crusher herewith illustrated is stated by the makers to be the result of many years experience in crusher building. The main frame, consisting of the sides, front jaw and back abutment, are separate pieces, enabling it to be shipped or installed in sections where necessary. The frame is bolted by steel bolts upon which all the crushing strains on the frame are designed to fall. The movable jaw is pivoted at the bottom, thus producing the smallest movement at the bottom of the

Rolling Toggle Crusher.

crushing faces with intent to give a uniform product. The jaw faces are of bars of hardened tool steel, made interchangeable. The lower bars wear first, and when so worn as to increase the size of the product they are to be replaced by the upper bars. Inserting a liner between the front and side frames of the main frame adjusts to crush to size desired.

Two heavy flywheels, of which either can be used as a drive pulley, furnish momentum to carry the eccentric over the load point, thus tending to reduce horse power. The toggles are of steel and roll on their seats, minimizing friction, there being no rubbing, no wear, and no oil being used.

The shaft bearing in side frames and pitman have large oil wells provided with chain oilers. The jaw shaft bearings are in removable glands, which fit over the ends of the shaft and press against packing at their inner ends to make a dust-tight chamber.

The bolts of the pitman cap are proportioned to break before any expensive part. These crushers have capacity for heavy work. They are made, by the Krom Machine Works, Jersey City, N. J.

Steam Turbines.

A recent computation has placed the total aggregate power of steam turbines in use or under construction or ordered in different parts of the world at over 500,000 H. P. Of this total the major portion is used, or to be used for the driving of dynamos, alternators or other electrical machinery, while the next in point of power consumption is marine engines. A contract was recently given to the British Westinghouse Electric & Mfg. Co., Ltd., by the Metropolitan District Railway Co. of London, England, for four turbo-alternators. Each is designed for a normal capacity of 5500 kilowatts, but capable of carrying an overload of 50%, giving about 11,000 E. H. P.

The dimensions of these engines are 29 feet long by 14 feet wide by 12 feet high. The steam pressure will be 165 pounds per square inch and the speed 1000 revolutions per minute.

METALLIC MANGANESE does not exist in nature, but is reduced in small quantities at great expense from its ores. It is quoted at \$1.25 retail per ounce avoirdupois. It is used to a very limited extent in laboratory work. Manganese dioxide is worth from \$8 to \$12 per ton, depending on its purity. It is useful as a flux in some smelting operations; in the manufacture of certain grades of steel; in the generation of chlorine gas in the Plattner process of chlorination. It is also employed in the manufacture of various chemicals, being combined with potassium, cyanogen, iron, etc.

Manufacture of Portland Cement in California.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS
by R. P. McLAUGHLIN.

Samples of both materials are taken regularly in the stone house, and the required weights of each, as shown by the analyses, are set upon their respective scales by the chemist. A car of stone and a wheelbarrow of clay are, after weighing, simultaneously dumped into a hopper, and thus mixed as they fall into the bin, which is in the adjoining building below. The next step is the drying of the mixture which passes from the bin through a Challenge ore feeder into the upper end of a slightly inclined rotary drier. The drier is 50 feet in length, having a diameter of 5 feet. A 10 H. P. motor maintains a speed of about sixty revolutions per hour. Along the inside Z-bars form shelflike projections which carry up and redrop the material, insuring that it shall be thoroughly exposed to the current of air heated to about 300° F. In about thirty minutes after entering, the dried mixture drops out just above the furnace and is caught by a 16-inch belt conveyor. The fuel used in the drier, as in all the other furnaces in this plant, is oil, the heat being deflected toward the upper part of the cylinder by a brick partition.

The fuel oil used at this plant is received in tank cars heated, if necessary, by steam, and allowed to run into a wooden tank in a building at the stock house. At the tank a 10 H. P. triple-acting pump forces the oil to three 25,000-gallon wooden storage tanks in a building near the stone house at the top of the hill. Two pipe lines lead from the storage tanks—one to the drier, the other to the kiln—the oil flowing by gravity. Each line passes through a heater, consisting of an iron cylinder filled with hot water, through which the pipe passes several times. The water is heated by an oil burner beneath the cylinder.

The first grinding of the dried material takes place in two Krupp ball pulverizers, each of which is a cylinder of about 10 feet diameter and 4 feet length, revolving on a horizontal axis. Armor plates, with holes of about 1/4-inch diameter, compose the inside of the cylindrical surface. A number of steel balls about 6 inches in diameter help to pulverize the material as the cylinder revolves. From a bin above a shaking feeder introduces the stone at one end of the cylinder near the axis. Careful adjustment is required to prevent overfeeding and clogging. When fine enough, the material passes out of the holes in the plates and through two sets of screens, which encircle the cylinder and allow only material passing a screen of twenty meshes to the inch to leave the machine. About 90 H. P. is required to start a pulverizer; then 45 H. P. is used in maintaining a speed of twenty-five revolutions per minute. This type of machine requires 16 H. P. to 18 H. P. per hour per ton. The sketch (Fig. 1, page 180) shows the construction of this machine. A 10-inch screw conveyor takes the material to three cylindrical pulverizers.

The cylindrical pulverizer is of 1/4-inch boiler plate and is about 30 feet long and 4 feet in diameter, with several transverse perforated partitions. A 75 H. P. motor revolves it about a horizontal axis at a speed of twenty-five to thirty revolutions per minute. The grinding action is performed by flint boulders of about 4 inches diameter which half fill the cylinder. The coarsely-ground mixture enters at one end near the axis and comes out ground so that 95% will pass a 100-mesh screen and drops onto a belt conveyor. The three pulverizers are shown in the accompanying engraving (Fig. 2, page 180).

The critical point of the whole process of cement manufacture is reached at the kilns or furnaces, of which there are three in this plant. The furnace is a cylinder with a length of 60 feet, being lined with 8 inches of specially prepared basic firebricks, leaving an inside diameter of 6 feet. The cylinder slopes slightly towards the furnace end and is revolved by a 5 H. P. motor at a speed of usually about twenty-five or thirty revolutions per hour, depending on the working conditions.

Air is forced into the oil burners at a pressure of about thirty pounds. The amount of material admitted by the feeder at the upper end of the furnace depends directly upon the speed at which the latter is revolving and is regulated by the furnaceman. The speed regulator consists of two double cones revolving on parallel shafts, each double cone serving

as a pulley and carrying a specially constructed belt.

During the revolving the material works down the cylinder into an increasing temperature until the maximum of 3150° F. is reached at a zone about 8 or 10 feet from the lower end of the furnace, where incipient vitrification takes place, which is the vital cement-forming process. Progress is noted by the furnaceman, who is necessarily the most skilled laborer in the works, by looking with colored glasses through an opening near the burners. The hottest zone looms up distinctly against the dark background of the cooler material farther up the furnace, and the position of the zone relative to the end of the furnace indicates the condition. The black ring is brought closer to the observer by increasing the speed and feed and forced back by decreasing them. Protection to the lining in the lower end of the furnace is afforded by a patching of the partially fused material which is occasionally forced into place by an iron rod in the hands of a workman. Upon leaving the zone of maximum temperature, the fused material becomes slightly cooler and drops out at the lower end of the furnace at nearly white heat. The material is now called "clinker," and its appearance is accurately described by the name, it being a dark colored, porous mass, having much the appearance of coke. About 36% of the original weight of the material has been lost in the heating process, either as moisture or as carbon dioxide. The only stops of the furnace are for relining, which is only about once a year. Reserves of the material are accumulated wherever possible in the mill, to prevent any stoppage of the kiln.

The clinker falls below to a cement-floored room, where it is either allowed to accumulate or, as is usually the case, cooled. Elevation of the material being worked takes place for the first time as the clinker enters the coolers. Two 2 H. P. bucket elevators catch the hot clinker and carry it up above the roof into the tops of as many coolers. The cooler consists of an upright boiler-plate cylinder about 8 feet in diameter and 40 feet in height, provided with umbrella-shaped distributors and shelves which force the falling clinker to pass to and from the center of the cylinder. Air is forced into the cooler from below by fans, and by the time the clinker has reached the bottom it is cool enough to be fed out upon a belt conveyor below, as desired.

After cooling, gypsum is added to the clinker in proportions suited to the rate of setting desired in the finished cement. Gypsum is the only material which is shipped into this plant; but, as the largest amount used is only 2 1/2% of the weight of the cement, the amount required per day will average about three tons.

A final grinding now completes the process of making cement, and this is accomplished in a set of mills of the same type as those through which the limestone and clay passed before entering the furnace.

About six hours are consumed in the material passing through the plant. The product passes 100-mesh screens and is taken by a belt conveyor to the top of the stock house. This is the second and last elevation. A screw conveyor takes the cement along above the double row of storage bins to which it is distributed. The planks forming the front of the bins are removed, allowing the cement to run out on the floor, from which it is sacked and delivered to freight cars standing on either side of the building. Special care, of course, must be taken during storage to keep the cement absolutely dry, and in the stock house an exception is made to the general rule of buildings entirely of iron, the roof being of wood covered by roofing paper and iron on the outside, which combination prevents sweating and dripping. The stock house contains fourteen wooden bins of capacity of 2500 barrels. The cement is always kept in the bins at least thirty days before shipping, which has been shown to improve it, and also avoids deterioration of sacks caused by warm cement. For shipping, canvas bags and paper bags of 1/2-barrel, or 100 pounds capacity, are used. The advantage of sacks over barrels, which are necessary during water shipment, are economy of space and ease of handling, and a saving is effected by the sacks being returned for re-filling.

The economic production of cement depends upon careful mechanical manipulation; but the chemical side of the work, besides requiring constant care and attention, calls for considerable experience and a special study of the subject. When the deposits of clay and limestone have been located, there must be a long series of analyses showing that none of the injurious impurities exist in large enough quantities to prevent the making of cement. After the plant is completed, a chemist must be retained on the routine work. The chemist is required to regularly sample the raw materials in the stone house and figure the percentage of each to be run. A strict watch must be kept on the drier, and still more vigilance is required to maintain the proper conditions surrounding the fusing. Samples of the cement must be taken several times each day and night to keep a close check on the calculations of the charge. Cement of absolute evenness, both chemically and physically, must at all times be produced. Daily reports, showing the results obtained at different hours, are made to the superintendent.

The percentage passing a 100-mesh screen is the

most frequent test made on the cement as it passes into the bins, the requirement being at least 95%. A determination of the rate of time of setting is another task allotted to the chemist. Time of final setting is defined as the time from mixing until the cement will support a rod of fixed weight, and must not be confused with the time of hardening.

Physical tests are regularly made, the most usual being the determination of the ultimate tensile strength of briquettes of 1 square inch cross-section. Two sorts of briquettes are tested, viz., neat briquettes, which are entirely of cement, and mortar briquettes, made of three parts sand and one part cement.

After the briquettes have been made they are placed in water and "pulled" at the end of one, seven and twenty-eight days, five briquettes generally being used at each testing. The test must be made immediately after removing the specimen from the water. A complete record is furnished by the test and retained in case of complaint regarding any lot of cement.

Mining and Metallurgical Patents.

PATENTS ISSUED MARCH 17, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF SEPARATING PRECIOUS METALS FROM SOLVENT SOLUTIONS.—No. 722,762; J. P. Schuch, Jr.,ripple Creek, Colo.

Process of separating precious metals from solvent solutions, consisting in neutralizing contained acid and free soda or carbonates, subjecting solution to precipitant, then to filtering agent, precipitating zinc held in solution, and subjecting the solution alternately to action of precipitant and filtering agent.

CRUCIBLE SMELTING FURNACE.—No. 722,831; O. Forshach and E. Clerc, Mulheim-on-the-Rhine, Germany.

In crucible smelting furnace, crucible supported above grate bars, with receiving portion arranged above crucible and communicating therewith, receiving portion having outlet extending thereinto above material in receiving portion, cover arranged on receiving portion, means for permitting fuel to be fed around crucible, heat rising from fuel entering receiving portion, directly engaging material in receiving portion previous to exhaust through outlet.

METHOD OF TREATING ORES.—No. 722,809; F. R. Carpenter, Denver, Colo.

Process of treating dry siliceous ores containing precious metals, consists in smelting them with sulphur, copper and basic flux, subjecting matte produced to oxidizing roast, resmelting product with siliceous flux, producing black copper containing precious metal and rich slag, adding rich slag to subsequent charge of ore, adding to black copper metallic

lead, subjecting mixture to heat and oxidizing blast, thereby forming coppery litharge and residue consisting mainly of precious metal, separating the two, smelting coppery litharge with sulphur-bearing material and other reducing agents, producing metallic lead and matte, finally smelting matte, producing metallic copper.

ROCK DRILL.—No. 722,914; V. Schneider, Tri-mount, Mich.

Combination in rock drill rotating mechanism, of rifle bar, cylindrical pawl carrying head secured thereto, provided on rear face with pawl receiving recesses, paws pivotally disposed in recesses, pin receiving openings formed in head at points under paws and in communication with air or steam space of cylinder of drill, pins adapted to openings and serving to hold paws in operative position, and ratchet disk for engagement with paws.

COMPOUND AIR COMPRESSOR.—No. 723,001; G. W. Marsh, Oakland, Cal.

In fluid compressor, main impelling and compressor cylinders with connected pistons moving in unison; and inlet and discharge valves therefor, supplemental impelling and compression cylinders, connected pistons movable therein, and valves whereby exhaust from first impelling cylinder admitted to drive piston in second, and valves through which partially compressed air delivered from second compressor cylinder to first compressor cylinder.

AIR COMPRESSOR.—No. 723,000; M. W. Marsden, Philadelphia, Pa., assignor to F. S. Cohn, Cleveland, Ohio.

Cylindrical casing provided with inlets, shaft fixed in respect to and arranged eccentrically of casing, carrier revolvably mounted on shaft and provided with movable wings or vanes, free ends of which ride on inner face of casing, receiving chamber formed between shaft and carrier, passages arranged under

vanes and communicating with chamber and with space included by casing, check valves arranged in passages and adapted to be actuated by wings.

ORE CONCENTRATOR.—No. 722,933; J. B. Arthur, Kansas City, Mo.

In ore concentrating machine, table, knife or scoop arranged to remove accumulations of ore, mud, etc., upon table, parallel worm and guide rods, frame secured to knife or scoop engaging worm and guide rods, means for rotating worm and causing advance or retrograde movement on part of scoop or knife.

METHOD OF TREATING ORES.—No. 723,212; P. A. Knappe, Grantville, Ga.

Process of treating ores feeding pulp to settler and grading same therein, continuously withdrawing each of lighter strata before contact with mercury, causing mixing contact of heaviest pulp particles with mercury, discharging non-amalgamable portion thereof, and separately recovering values from different grades withdrawn from settler.

PIPE COUPLING FOR DEEP BORING DEVICES.—No. 722,764; T. Steen, Berlin, Germany.

Coupling for flushing pipe and lifting device of boring apparatus formed with two chambers therein, one of which connects with flushing pipe supply, and other with lifting device supply.

PROCESS OF TREATING NICKEL ORES, ETC.—No. 723,159; T. Jenkins, Webster, N. C.

Process treating nickeliferous material, by subjecting material to action of suitable solvent, precipitating nickel from solution as nickel oxalate, reducing nickel oxalate to nickel oxide, adding calcium carbonate to filtrate to precipitate calcium oxalate, and recovering oxalic acid from calcium oxalate.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Judge Wickersham of the United States District Court, Third Division, Alaska, has removed the office of commissioner from Circle City to Fairbanks, on Pedro creek, the center of the strike on the Tanana river.

Superintendent J. Reagan, operating the Reagan group of lode claims on Sheep creek, near Juneau, reports opening up a 4 foot vein of gold quartz ore.

At No. 2, on Daniel creek, Topkok, near Nome City, J. Berger and J. T. Sullivan have eight men at work and have opened up 25 feet of gravel which carries pay, says the Nome Nugget. A shaft will be sunk to 100 feet, if necessary, to find bedrock. This claim will be hydraulicked the coming season, water from the Topkok Ditch Co.'s system being used.

The Nome Gold Digger quotes the following wholesale prices for supplies at Nome: Potatoes, per crate, \$5; onions, per crate, \$6; eggs, per case, \$19; sugar, per 100 pounds, \$9; hams and bacon, per pound, 25 cents; coal, per ton, \$25; hay, per ton, \$55.

The Nome Nugget says the Kelly pumping plant of the Nome Exploration Co., on the west bank of Nome river, at the mouth of Dexter creek, will be in operation next month. It consists of eight 25 H. P. portable boilers and three compound condensing pumps, but will be enlarged during the summer by the addition of two more pumps and six boilers. From Nome river the water will be pumped through 6-inch mains to four wooden reservoirs of 5000 gallons each (two on north side of King mountain and two across the canyon on north side of Dexter mountain at an elevation of 900 feet). The company will have no water for sale, but will conduct it from the reservoirs through other pipes to the ground they intend working. They will operate this season on Dry, Grass, Newton and Dexter creeks with their largest hydraulic operations on the Sugar claim. The fuel used in the furnaces will be crude oil. A. E. Campbell is superintendent.

According to Nome advices, a strike has been reported on the Shungwak, a tributary of the Kobuck, and there is a stampede on from Candle in the Immachuck country. It is reported all unrepresented property was staked on January 1st. A new discovery has been made on Inglechuck, several miles below Dasley's. From one prospect hole forty pans yielded \$27 of coarse gold.

A quartz ledge 75 feet wide, carrying values in gold, has been found on Norton sound, 50 miles below Chink. A number of men are at work developing the property; a 60-foot shaft has been sunk and a vein crosscut at that depth.

ARIZONA.

COCHISE COUNTY.

The Portage Lake & Bisbee Development Co. has incorporated at Hancock, Mich., to operate a group 3 miles from Bisbee and 1 mile from the Calumet and Pittsburgh group.

At the Calumet & Arizona smelter at Douglas an additional furnace is being erected which will double the output. It is expected to blow it in next week. At present their output of copper is 800 tons per month. There are 100 men on the payroll, which will be increased to 350.

A steam hoisting plant will be installed on the Bisbee Con. Co. group in the Solomon Springs district, south of Bisbee, says Manager R. H. Samuel.

The Bisbee-Arizona C. M. Co. has begun work on its group 7 miles from Bisbee, in Iron Mountain district, adjacent to the Modern mine.

The Cottonwood M. Co. of Dos Cabezas, F. Hellig manager, have resumed. A hoist and pump have been put in.

The work of sinking the new shaft of the Tombstone Con. M. Co. at Tombstone is progressing and is down 110 feet below the water level. The station for the 700-foot level is being cut. The pumps are working steadily, throwing 1,700,000 gallons of water per day. The company has laid a pipe line from this shaft to the Tribute and Lucky Cuss hoists, which they intend to start again. A larger hoisting engine will be put in at the Tribute.

At the Copper Glance mine at Bisbee grading for the machinery is finished and the pump station has been cut at the 500-foot level.

The Bisbee Review says that at the Lowell mine, near Bisbee, the boiler plant is being completed. They have finished their third compartment and have driven the tunnel from the 60-foot landing to the

railroad. A new flat cable has been put on the hoist. They are handling a large volume of water, and will work ballers till their pumps are in place.

GILA COUNTY.

At the Old Dominion mine at Globe the four-compartment shaft is down 40 feet and the temporary gallow-frames in place. Another pump is being put in on the twelfth level of the present working shaft. At the smelter the supply of ore is increasing and the coke and coal bins are filling, says Superintendent Hoar.

P. W. Fleming, secretary of the Gold Mountain M. Co., states that the Golden Wonder mine has produced \$100,000 by arrastras. The property has 2500 feet of development and recently new ore bodies have been discovered.

GRAHAM COUNTY.

P. F. Crowley and A. Burke will begin development work on their Copper Plate group of nine claims on the south side of Coronado mountain, near Metcalf. The Copper Plate lode lies 1/2 mile east of the Coronado lode and is from 25 to 100 feet in width.

MOHAVE COUNTY.

The Argo mine on Sherums peak, near Chloride, is being worked by T. McNeely, the owner. The main tunnel is in ore for some distance, and stoping began this week. The ore is lead carbonate, carrying values in silver and gold.

The Oro Plata mill has been started this week on a trial run.

The P. & A. Co. have their hoist in operation on the Mother lode. The shaft is 75 feet deep with 3 feet of ore in the bottom.

The Homestake group of mines, near Snowball camp, near Kingman, has been bonded to the Gold Roads Co. for \$400,000.

The Ben Doran group of mines are being developed by E. B. Smith, A. and J. Bauman of Fremont, O., members of the Swiss-American M. Co., owning these mines near Kingman. At the depth of 100 feet on the Uncle Sam the vein shows ore and drifts have been run 50 feet each way on the vein. Much of the ore shows free gold. On the Ben Doran a crosscut 200 feet north of the Wilkinson shaft opened up 18 inches of the same ore found in the discovery. It is proposed to install a reduction plant.

Manager L. Hoffman of the Samoa mine, near Chloride, says he has twenty pack animals bringing out four tons of ore per day. They have two parallel veins—the Fourth of March and the Samoa. On the Fourth of March a shaft is down 115 feet and showing in the bottom a 20-inch streak running three ounces in gold, sixty ounces silver and 10% lead. A crosscut will be run 175 feet under the Samoa vein at the Bowman tunnel, in 90 feet, which will tap the vein at a depth of 400 feet. It will be used as a working tunnel.

YAVAPAI COUNTY.

Glenson & Gelge are developing the North Star mine on Lynx creek, near Prescott, and show 5 feet of free milling gold ore assaying \$30. Several of the mine owners of this camp have decided to jointly erect a stamp mill this spring, as there is plenty of ore on the dumps to keep ten stamps dropping for six months, says the Prescott Prospect. Boblet & Bowman are working the Gold Tunnel group. H. Watson, west of the Bonnie, has his shaft down 115 feet.

ARKANSAS.

MARION COUNTY.

The Arkansas Zinc & Lead M. Co. has incorporated at Dodd City; W. H. Sisson, R. Sanderson, M. Mallory, F. Batt.

PULASKI COUNTY.

The Central M. & D. Co., of Little Rock, has been incorporated; H. E. Smith, D. D. Brunson and J. A. Brunson.

CALIFORNIA.

AMADOR COUNTY.

The 40-stamp mill at the Zella mine, near Jackson, resumed last week, after a suspension of several months.

At the Fremont-Gover mine, near Drytown, grading for the 40-stamp mill continues. It is expected the mill will be ready for crushing by July 1.

The Amador Dispatch says J. Macdonald has made a change in the system of management at the Keystone mine at Amador City, of which he is the owner. Instead of having a superintendent at the mine, there are foremen over the mill, the store and mine, each of whom reports direct to the owner at his headquarters in San Francisco.

KERN COUNTY.

Jensen & Hoffman are putting in a whim at the La Crosse mine, near Randsburg, and operations will resume next week. — The Santa Anna is having a

millling at the Red Dog mill. — Atkinson Bros. have put in an electric battery for blasting purposes at the Sunshine mine, near Randsburg.

The premature explosion of a blast in the Sunshine mine, 2 miles from Randsburg, on the 26th inst., buried one miner under tons of rock, caving the mouth of the mine and the portion in which he was at work.

The Union Pacific Oil Co. will begin drilling on the Carisa plains, near Bakersfield, in entirely new oil territory, says the Reporter.

The California Combined Oil Co. report having struck oil north of Bakersfield at a depth of 1020 feet.

Eastern men last week bought forty acres of oil lands at Sunset, adjoining the Pittsburg, Stratton and Sunset Queen, for \$83,000. Development work will begin next week and additional wells sunk. W. B. McIntosh is manager.

MONTEREY COUNTY.

Graham & Kellerman of Los Angeles will begin drilling for oil next week on the De Alvarez ranch, near Bitterwater, San Benito county.

NEVADA COUNTY.

Electric pumps are to be installed in the Brunswick mine, near Grass Valley, says the Tidings-Telegraph. Three of the pumps will have a capacity of 750 gallons a minute.

G. W. Root and J. W. Helsner have been given a bond on the Alta California gravel mine, 3 miles west of Grass Valley. It consists of a claim of 140 acres.

A 10-stamp mill has been installed at the Pine Hill mine at Wolf.

At Grass Valley, Superintendent W. H. Dunlap of the Lecompton M. Co. reports having shipped five carloads of assorted ore to the smelter last week which averaged \$150 per ton.

The 8-stamp mill of the Murchie M. Co., near Nevada City, was destroyed by fire on the 19th inst. The mill plates were saved.

ORANGE COUNTY.

(Special Correspondence).—The Santa Ana Tin M. Co. of Los Angeles, with mines in Trabuco canyon, recently installed a set of Leyner machine drills, a Leyner air compressor and gas engine. A new hoist, recently purchased from Thomson & Boyle of Los Angeles, has been sent to the mines, where it will be installed.

It is reported that the Brea Canyon Oil Co. will install an electric generating plant, to be run with the natural gas from their wells near Fullerton.

PLACER COUNTY.

Superintendent E. J. Kendall of the Three Stars mine, near Auburn, says he has sixty-five men at work. They are running a drift on the 700-foot level to connect the Belmont and Three Stars shafts, a distance of 2100 feet, of which 1200 feet has been run. It will drain the water from the Belmont to the Three Stars, where they have put in a triple-plunger electric pump, which will raise the water 720 feet vertically with one lift. The drift is being run for ventilation as well as drainage. Work is being pushed in all the levels in both shafts, with an output of ninety tons per day.

All work on the Gold Blossom mine, near Auburn, has been suspended and the pumps were pulled from the mine last week.

The Centennial mine on Duncan hill at Ophir is in operation.

At the Dardanelles placer mine, near Forest Hill, operated by an Eastern company, the last storm carried the dam, pipe and flume lines, and other improvements away. They are ground sluicing, however, and taking out good pay.

SACRAMENTO COUNTY.

The Borges ranch, near Negro Hill, near Folsom, has been bonded to the Old Homestead M. Co. for ninety days and it will be prospected to determine its value for dredging.

SAN BERNARDINO COUNTY.

The Gold Peak M. Co. is installing a 5-stamp mill and cyanide plant on the Johnson mine at Victor.

SHASTA COUNTY.

W. T. St. Aubyn is operating the Shafter mine, on the divide between French Gulch and Deadwood. The tunnel is being retimbered.

A new roadway is being cut to connect the Sybil mine, near Shasta, with the county road. Manager Von Kruze says he will move machinery from the Black Diamond, near Gray Rocks, across the river, to the Sybil.

At the Milkmaid mine, owned by Jones et al., the mill and hoist are in operation. This week the Mountain C. Co., at Keswick, made the first shipment of copper since the strike began, the copper going

to the refinery in New Jersey. This shipment was one of the largest in the history of the company.

It is reported at the Aftertought mine, near Bella Vista, preparations are being made to install a 150-ton smelter this spring.

SISKIYOU COUNTY.

(Special Correspondence).—M. J. Whitney & Co. of Detroit, Mich., working the Pine Grove mine by hydraulic elevator, 2 miles above Oak Bar, are getting good pay from bedrock, taking out \$150 in two hours last week.

Daggett Bros. & Co. recently struck a pocket on the Red Cross mine; in a quartz-porphry dike, \$2800 being taken out. They are building an arrastra. The mine is 3 miles above Oak Bar.

The Barkhouse hydraulic mine, owned by Lange Bros., is doing well this season, with an outlook for a prosperous season. Oak Bar, March 20.

Work was resumed last week at the Scott mine on Indian creek, near Etna, after a short shutdown, says Superintendent Scott.

Superintendent Geary of the Tacoma M. Co. has men at work on the Eastlick mine, three-fourths of a mile from Oro Fino. It is intended to sink the shaft 200 feet.

The Cherry Hill mine, near Yreka, is being operated with twenty-five men at work. The main tunnel is in 1600 feet, from which they are drifting both ways.

The McKean mine, above Callahan, took on twenty-five more men last week, making a total of sixty at work.

E. Brokaw of Quartz Valley is making preparations to start up the Golden Eagle quartz mine, on Indian creek, near Fort Jones, and will sink a shaft at least 250 feet.

J. R. Wade, superintendent of the Porter Bar M. Co., near Etna, has sunk the shaft 50 feet and expects to reach bedrock this week, says the Etna Advance. As soon as the bedrock is reached, he will run crosscuts under the river bed.

M. Wacker has men at work on his placer mine on Yreka Flats, at the head of Spring gulch, near Yreka.

TUOLUMNE COUNTY.

The work of retimbering the shaft on the Pennsylvania mine at Cherokee, near Carters, has begun. The shaft is caved from the collar to a depth of 40 feet. When this is repaired the pumps will be started to take out 200 feet of water, says Superintendent C. L. Lang.

Work is resumed at the Mayflower tunnel, near Groveland, after a temporary shutdown for repairs.

At the Cosmopolite mine Superintendent Argall says the shaft will be sunk an additional 200 feet. It is proposed to install a stamp mill this spring.

The Willetta mine at Jacksonville has suspended operations, says Superintendent Stayton.

Superintendent G. A. Whiteford of the Norwegian mine, near Tutletown, says their mill will be enlarged to twenty stamps.

The Ribbon Rock G. M. Co. has deeded to the Yankee Hill G. M. Co. for \$3750 the Polson Oak mine and improvements, near Carters.

The Don Pedro G. M. Co. have bought the Juster quartz mine near Don Pedro Bar, near Chinese.

In the Dutch mine at Quartz they have in drifting on the thirteenth level struck the ore shoot which yielded on the level above.

A. W. Weaver will open up a group of gravel mines on the Stanislaus river north of Confidence.

At the Woodside gravel mine, near Columbia, Estey & Stanford have bought the interests of Woodside Bros. et al.

YUBA COUNTY.

At the O'Brien mine, 9 miles east of Marysville, it is proposed to install a dredger.

COLORADO.

BOULDER COUNTY.

The Wood Mountain mill, near Wall Street, has resumed after a temporary shut down to enlarge the mill.

CLEAR CREEK COUNTY.

Native silver is reported struck in the 9th level of the Corry City mine, near Silver Plume.

Operations have begun on the Collins lode, near Silver Plume, by the Denver Leasing Co., the adit level cleaned out and driving resumed. A winze has been sunk from the adit to a depth of 60 feet and drifting done from the bottom of the winze, opening up ore.

DOLORES COUNTY.

The Atlantic Cable mine of the United Rico M. Co., near Rico, resumed operations last week. The company is enlarging the shaft, and a hoist will be installed and an aerial tramway built from

the mine to the mill, which is on the railway. When the tramway is in operation the tunnel, through which the ore was formerly trammed from the mine to the mill, will be abandoned. The Rico-Aspen Con., owned by the same company, will be reopened the coming summer. The zinc plant will be enlarged.

GILPIN COUNTY.

A Denver company is operating a group of sixteen claims at Nevadaville. The principal work has been done on the King, Lamherson & Warren and Oranoke, and through these the others are opened up. The ore is a lead body carrying gold, with some iron and a little zinc. The King shaft is 600 feet deep, the Lamherson & Warren 220 feet and the Oranoke 250 feet. The veins are 3 to 4 feet wide and the smelting ore runs \$40 gold per ton and the mill ore \$8. A crosscut on the 400-foot level broke into a vein 23 feet wide last week. It is proposed to install a 100-ton concentrator this season. T. Marx, G. W. Kramer, G. B. Dodge, J. W. O'Connor, W. C. Thomas, J. Flischer and E. B. Coe make up the company.

The Golden Rod M. & M. Co., owning and operating the Money Maker, Merry Monarch, Pet, Vindicator, Redemption and Good Luck claims, in Silver Lake district, near Central City, are installing a steam hoisting plant on the Pet claim. The shaft on the Pet is down 75 feet. Chicago, Ill., parties are interested, with J. Lillig president and manager. It is proposed to build a mill next summer.

The Grand Central G. M. Co., owning the East Whiting mine at Central City, has decided to sink its shaft 200 feet deeper, making it 660 feet, and two additional levels will be run. The company is producing fifteen tons a day of smelting grade ore that runs \$80 and milling grade that runs \$7 a ton. H. Demasters, H. H. Barbee et al., of Colorado City, have control.

GUNNISON COUNTY.

(Special Correspondence).—The mine and mill of the Red Rover Co. have closed down indefinitely, all men laid off and a watchman put in charge. This company have an option on a tract of land 1½ mile north of Gunnison, on the Gunnison river, where they expect to erect a smelter of 100 tons daily capacity, and when completed will start up their mine and mill again. They have plenty of iron ore and lime for fluxing within 3 miles of their smelter site.

Gunnison, March 22.

HINSDALE COUNTY.

(Special Correspondence).—Rich silver ore was recently reported found in the Klondyke, on Henson creek, owned by Bardwell, James et al. A streak of talc 4 inches wide on the hanging wall of a vein is filled with native silver, specimens of which assayed 4400 ounces per ton.

The 100-ton concentrator of the Hidden Treasure M. & T. Co., near Henson, has started up after being idle three months on account of lack of water, and is now turning out a lead-silver concentrate of good value. The ore is concentrated about 10 into 1, and, although low in grade, yields a good profit.

The Monte Queen, a short distance from Lake City, on the Lake Fork, principally owned by New York men, is producing some good ore. W. Mendenhall is in charge.

A meeting of the stockholders of the Crystal Lake G. & C. Co. is to be held at Lake City on April 9 to elect directors and to make plans for working the property. This company owns the Hub and Vandalia claims on Hotchkiss mountain, on the same vein as the Black Crook. Some very rich tellurium ore has been found on the Vandalia claim.

The new shaft on the Ute & Ulay is finished and the crosscut started to the vein. They are now in 40 feet and expect to cut the vein at 150 feet from the shaft.

Lake City, March 17.

JEFFERSON COUNTY.

The smelter operating at Golden, under the Clear Creek M. & R. Co., has been shut down and Superintendent A. Carpenter has announced that the suspension will be permanent. This action is due to trouble with labor unions. As a result of this shutdown, several of the mines around Empire and in Clear Creek county have been forced to suspend work, as the ore which comes from them is such as can be treated only at the smelter which was operated in Golden.

LAKE COUNTY.

At Leadville the company driving the Yak tunnel will remodel the Johnny mine cyanide plant, near the Arkansas smelter, into a zinc-lead separating mill. A. R. Meyer is manager, and says the plant will have a capacity of 100 tons daily.

The concentrating mill on the Peerless Maud mine, in Horseshoe district, near Leadville, was started last week, says

Manager H. Dyatt. It has a capacity of sixty tons daily.

The Two Bit G. & C. Co., near Leadville, have sunk their shaft another 65 feet and begun drifting.

President Lapsley will resume operations at the Robinson smelter at Leadville next week.

The Midas M. Co. at Leadville is shipping 150 tons of ore per day. Drifts are being run from the Midas ground to connect with the Coronado, and as soon as retimbering is completed at the latter drifts will be started from that end.

The Carbonate Chronicle says W. Johnston of Denver has leased the Found Out lode, near Leadville.

Superintendent J. H. Henley of the Valley L. & M. Co. is reopening the Valley mine at Leadville, and will sink the shaft (down 300 feet) deeper, following down the ore.

C. R. Oegood and T. Sullivan, lessees on the Sixth Street shaft at Leadville, in opening new ground on the 600-foot level west have found a body of manganese and silver-iron ore. Shipments average fifty tons a day.

MINERAL COUNTY.

The Creede Candle says work will be resumed on the Ridge mine, near Creede, by J. Oetrum, operating under lease.

SAN JUAN COUNTY.

The Continental-American G. M. & M. Co. was incorporated at Denver last week by New York men to operate a group of mines in Corkscrew gulch, 4 miles from Gladstone. About 450 feet of work has been done on two tunnels and a shaft is down 120 feet. Buildings will be erected and machinery placed.

Work was resumed last week on the Sultan tunnel of the North Star group on Sultan mountain, near Silverton. This level is being reopened to cut at depth the Gladstone group of claims under bond to the Silverton M. Co. The Gladstone adjoins the North Star on the east and the Sultan tunnel opens up the North Star vein to within a few feet of Gladstone ground.

The Gladstone mine, on Sultan mountain, near Silverton, is under bond and lease to the Silverton M. Co. for \$25,000. This claim is between the Hercules and Old North Star, of which property it is the extension.

SAN MIGUEL COUNTY.

(Special Correspondence).—What is supposed to be the Argentine vein has been struck in the Black Bear tunnel etc. The values of the vein have not as yet been determined, but samples that have been brought down look good. The crosscut tunnel is being driven ahead. H. H. McLean is superintendent.

Telluride, March 20.

The Caribou-Montgomery group, at Ophir, has been sold to a company of New England men, and the first payment of \$50,000 made by Manager Axtell of Boston. A larger mill will replace the one on the property.

TELLER COUNTY.

An ore shoot has been opened at the depth of 100 feet, south of the shaft on the Hillside claim of the Creede & Cripple Creek Co. on Gold hill, Cripple Creek. The find shows 5 feet of ore averaging \$30 per ton, and is in a north and south vein which forms a junction with the east and west vein near the shaft. Heretofore all the work done there has been in the east and west vein.

The Magnolia mine on Gold hill, Cripple Creek, above the Midland sampler and adjoining the Madeline, is to be developed by New York men who have a lease. Machinery will be installed and work started in the shaft. A dyke cuts through the shaft and it is to be exploited to ascertain if it contains an ore shoot.

In the 30-foot crosscut run from the bottom of the 60-foot shaft on the Des Moines mine, on Raven hill, Cripple Creek, a 2½-foot vein has been opened up, assaying \$8. It is the intention of the lessee to make a shipment next week, and he will sink on the vein as soon as the extent of the ore shoot has been determined at the present depth. The shaft will then be put down 200 feet deeper.

Manager Rice of the Stratton's Cripple Creek M. & D. Co. says pay ore at the depth of 1500 feet has been found in the American Eagle mine on Bull hill, Cripple Creek. This is the greatest depth that ore has been found in the district. The bottom level of the Eagle mine is 1500 feet vertical. Before this ore was found the greatest depth ore was known to come from in the district was from the Blue Bird, at a depth of 1300 feet.

A strike has been made at 600 feet in the Last Stake claim, adjoining the Gold Coin, in Victor, owned by the American Con. Co. The find was made west of the shaft, and the shoot is but 2 inches in width, filled with free gold. The mine is under lease to the Last Stake G. M. & L.

Co. for four years with a flat royalty of 30%, with A. C. Denslow superintendent.

At the Dan Hanley shaft of the Cripple Creek Enterprise G. M. Co., at Cripple Creek, a heavier steam plant of machinery is to be installed, says Manager D. Hanley. The plant will consist of two 80 H. P. boilers, a hoist with a capacity of 1000 feet depth, and an air compressor. The shaft is down 200 feet, at which point the vein and dyke have been opened.

Lessees Lowrey & Middagh made a three-carload shipment of ore last week from their lease on the main workings of the Clara D. claim of the Lexington Co. at Cripple Creek, which averaged \$25 per ton. The lessees have drifted on the vein 35 feet to the south and will start the north drift next week. The lessees propose to put in an air compressor to further develop the ore body.

The Uncle Sam Co. at Cripple Creek, K. MacDermid secretary, is making cyanide tests on the ore which has been opened. On the Alta claim of the company men are at work under lease.

The Cripple Creek Times says there are at present 134 shafts in Cripple Creek district within an area of 6 miles square from which ore is being hoisted. Bull hill has 51, Raven hill 18, Beacon hill 12, Squaw mountain 5, Battle mountain 13, on Womack hill are 3, Tenderfoot has but 1, as no work is in progress on the Hooder, Ironclad hill has 4, Guyot hill 3, Gold hill has 24. From some of these shafts more than one lessee is producing ore. The companies operating here give employment to over 6000 men in and around the mines.

At the meeting of the directors of the Golden Cycle Co. held last week the board decided to buy the Aluminum, Fedora and Lone Star claims, adjoining the Golden Cycle on the west, for \$27,250. On the Aluminum claim a shaft is down 600 feet, with considerable drifting and cross-cutting done.

IDAHO.

BLAINE COUNTY.

The Fourth of July M. & M. Co. has been incorporated to work the Fourth of July group of claims on Hailey hill, near Hailey; M. S. Tustin, B. Cooley, L. Yancey, F. Meyn, B. M. Whisner, W. A. Weston and J. W. Ferguson are the directors.

S. Allen, superintendent of the Della Mountain Co.'s mines near Hailey, says the tunnel is in 1400 feet, with 500 feet additional to drive to tap the vein. Three shifts are driving it by hand, making an average of 100 feet per month.

BOISE COUNTY.

A one-half interest in the Edna group of quartz claims, near Idaho City, has been sold to the California M. Corporation for \$10,000 and full payment made. The sale includes a one-half interest in a sawmill and quartz mill. But little development work has been done on any of the claims outside of the Edna, on which a tunnel has been run 1200 feet, gaining a depth of 340 feet. A raise extends from the tunnel to the surface. The pay shoot has been followed 200 feet, average width of ledge 5 feet. The ore carries silver and \$5 per ton in gold. The 5-stamp mill on the Edna will be replaced next summer by twenty stamps.

CUSTER COUNTY.

Manager J. A. Cizek of the Lost Packer M. Co., operating the Lost Packer mine, near Custer, says he will install a 5-stamp mill next month. The mill will have to be packed a distance of 18 miles. As soon as a road is completed this spring the capacity of the mill will be increased.

IDAHO COUNTY.

Superintendent Jewell has men at work for a Kansas City Co., 4 miles south of Roosevelt, and reports values of \$6 per ton for 30 feet in one crosscut tunnel and a 2-foot streak in another that runs \$75 per ton. It is proposed to build a mill next summer.

LEMHI COUNTY.

Analyses received last week of nickel-cobalt ores found in the Blackbird district, near Salmon, are reported to show the ore to contain 13% of nickel and cobalt (mostly cobalt). Work will be done this year by the parties who have a bond on the Go's mines.

The Kittle Burton Co., operating with fifteen stamps on Indian creek, near Salmon, are shipping \$10,000 in gold per month, and they propose to add fifteen stamps more to their mill.

OWYHEE COUNTY.

The Banner, Ontario and Tip Top groups of mines were sold last week to G. W. Venable of New York for the Tip Top M. Co. of New York. The three groups are west of Silver City, on Florida mountain, and west of the Trade Dollar Co.'s mines. Considerable development work has been done on these properties.

On the Tip Top there is a 300 foot shaft, besides crosscuts and drifts. A 500-foot tunnel crosscuts the Ontario and taps the Tip Top shaft. On the Banner group there are 1500 feet of shaft and tunnel work. D. Farmer is superintendent.

SHOSHONE COUNTY.

It is reported the New Jersey M. Co. will install a 10-stamp mill near Wardner, to be later increased to forty stamps.

ILLINOIS.

JO DAVIES COUNTY.

The concentrating plant of the Grant Reduction Co., near Galena, has begun operations. Air drills have been put in and development work is in progress. A body of zinc ore is being opened up, and miners are at work stripping an ore body which lies close to the surface.

KENTUCKY.

CRITTENDEN COUNTY.

The Keystone M. Co. has incorporated at Sturgis to operate in this county.

Concentrating tables are being put in at the Old Jim mine, near Marion, for saving the fines which have in the past been going into the dumps. Up to this time the zinc ore shipped has been picked or washed in simple contrivances which free the gangue from the ore. A separating plant has been erected at Paducah, McCracken county, where it is proposed to clean ores from this and other districts in the Kentucky-Illinois field. It is proposed to transport the ores by water to Paducah. The car shortage has caused considerable delay in shipments, there being several hundred tons of ore ready.

JEFFERSON COUNTY.

The Crater M. Co., of Louisville, has been incorporated; F. D. Hussey, St. J. Boyle, A. L. Robinson, et al.

MICHIGAN.

HOUGHTON COUNTY.

The rock from the Baltic mine, near Houghton, continues an average yield in mineral of thirty-three pounds per ton. The four heads of stamps at the mill are working steadily; each has a capacity of 400 tons per day, which will be increased to 500 tons. The present milling cost averages 27 cents per ton; but with the additional labor-saving devices to be installed, it is expected to reduce this to 22 cents.

ONTONAGON COUNTY.

The Victoria mine, at Victoria, has decided to use compressed air to work the mine and mill instead of electricity. The dam was finished last autumn; power line from canal to millsite approaching completion; work of sinking new shaft begins next week.

The Adventure mine, near Mass City, is taking silver from the Butler lode; the amount recovered at mill is sufficient to pay for washing; 400 men are working at mine; product is running twenty-three pounds per ton and mineral 80% ingot.

Superintendent Wilcox of the Mass mine, at Mass City, says the output of the mine will be increased, and by the end of the year both heads will be running steadily.

MONTANA.

BEAVERHEAD COUNTY.

C. M. Stolle and G. Eighorn have a lease on the slag dump of the Hecla mine at Glendale, near Dillon, and will begin work as soon as the weather permits. It is intended to thoroughly test the slag dump and jigs will be secured from the concentrator formerly used by the Hecla Con. Co. and part of the slag will be concentrated. The first material used will be the screenings. It is their plan to install a smelter if the developments of the future justify it.

BROADWATER COUNTY.

Manager A. M. Easterly says that last week he received returns from a car of ore shipped from the Hard Cash mine, near Radersburg, which netted \$52 per ton in gold over smelting charges. The ore is sulphide of iron. The mine is worked through a tunnel. Shipments of gold ore have also been made from the Last Chance and other claims in the group owned by Easterly & Co.

CARBON COUNTY.

The entire property of the Clarke Fork Fuel Co., at Geho, was sold at sheriff's sale last week to F. H. Davis of Omaha, Neb., for \$95,000. The mine has been closed for several months under an injunction.

Miners in the employ of the Elbow Creek Coal M. Co., at Joliet, have gone out on a strike because an agreement could not be reached with the company on tonnage and the manner of weighing the coal. The men demand a ton of 2000 pounds,

while the company insists on the long ton of 2240 pounds, as established by law. The custom has been to weigh the coal after it was placed in the car. The men claimed it should be weighed as soon as it came from the mine, as otherwise the men do not get credit for the actual work done.

CASCADE COUNTY.

In order to encourage mining at Nelhart the Great Northern road has announced a reduction in the freight rate on low-grade ores, from that camp to the East Helena smelter, from \$4 per ton to \$2.50 per ton.

FEROCES COUNTY.

The proposed merger of mines in Kendall district, involving the Barnes-King group at Kondall, is off, says Manager Barnes of the Barnes-King, the option having lapsed.

GRANITE COUNTY.

The Gold Reef M. Co. was incorporated last week at Phillipsburg; L. L. Stephens, G. D. Wilson and L. U. Loomis. They have bought the Dawn-Reliance-Blazer group of lode claims, 5 miles from Flint station, near Phillipsburg. Over 300 feet of tunnels and shafts have been driven on the vein and the ore assays \$20 per ton in gold.

LEWIS AND CLARKE COUNTY.

C. Hartman and T. Cooney of Helena have a bond on the Ophir placer claims below Helena, comprising a strip 2½ miles wide.

On the Gold Messenger mine, near Marysville, the tunnel is being driven to cut the lead at a depth of 300 feet. At 100 feet on the strike of the lead are 16 feet of milling ores which carry gold values. The company will erect a 50-stamp mill to take the place of the mill destroyed last fall.

The Montana Marble & Mining Co. of Spokane, Wash., are arranging to put in machinery the coming season for quarrying and dressing the marble for market. The company owns 465 acres 3 miles from Helena. The deposits were opened last season.

MADISON COUNTY.

(Special Correspondence).—C. Logan & Co. have located a vein of black oxide of manganese of fine quality near Rochester. The vein crops 2000 feet in length. Assays have shown the mineral (pyrolusite) to contain 96.67% manganese dioxide. It is located 4 miles from the railroad. Rochester, March 23.

PARK COUNTY.

The Buffalo G. M. Co. of Montana has been incorporated by Buffalo, N. Y., and Montana men, to operate a group of six claims in New World district, at Cooke. Some development has been done, the principal work being a tunnel driven on the Great Eastern 100 feet into Henderson mountain, to strike a vein, which has been crosscut for 6 feet without showing the hanging wall. It is proposed to build a 10-stamp mill on Stillwater creek at the mouth of the Great Eastern tunnel. D. G. Ross is manager.

The Kimberly G. M. Co. has resumed work on the construction of their cyanide plant at Jardine, and it is expected to have the plant in operation by May 10. With its completion work in the mine will resume and the tailings from the 40-stamp mill will be flumed to the cyanide plant.

SILVER BOW COUNTY.

The Speculator mine, at Butte, which has been closed on account of litigation, resumed operations this week with 150 men at work, with Superintendent Wishon in charge. When the mine is in full operation its output is 1000 tons of copper-silver ore per day.

NEVADA.

ELKO COUNTY.

The Nevada State Journal reports oil struck this week in a well being bored a mile and a half from Elko.

On the Fond Treasure and Mahoning mines, near Tuscarora, development work is being done.

ESMERALDA COUNTY.

The South Nevada M. Co. has been incorporated by New York men to operate a group of thirty claims 12 miles from Silver Peak. A mill will be installed and water piped from the White mountains.

LINCOLN COUNTY.

E. F. Freudenthal has a bond on the Victor mine, northwest of the Alps mine, near Pioche.

LYON COUNTY.

The capacity of the Davis-Gignoux cyanide plant at Dayton has been increased to 250 tons per day and they are running on tailings from Silver Hill rock crushed at the Rocky Point mill.

NYE COUNTY.

A new mining district called Atwood

has been organized, 80 miles northwest of Tonopah, says the Journal.

STOREY COUNTY.

Manager J. Ryan says, on Brunswick Lode in the Chollar mine, near Virginia City, No. 1 shaft, 600 level, the south lateral drift was last week cleaned out and timbered 130 feet; total distance from the incline, 1175 feet. Electricians are wiring the mine. Drill hole No. 3 has been sunk 101 feet; total, 1109; bottom in porphyry. Have discontinued sinking, and are removing casing preparatory to starting hole No. 4.

Fishers' mill, in the canyon near Virginia City, is running on custom rock from the Lady Bryan district. The cyanide plant will start next week to work the Sierra Nevada tailings.

The Lizard mine, northeast of the Comstock, near Virginia City, will begin development work this spring. A mill to be run by electricity will be built at the mine.

The total bulk assay value of the ore yield of the Comstock mines for the week ending March 14th was \$10,889.07. Of this the Con. Cal. & Va. produced \$5,275.47; Ophir, \$340; Silver Hill, \$4420.77; Caledonia, \$556.50; Justice, \$237.33.

WASHOE COUNTY.

Work at Willow Glen, above Steamboat, by Superintendent Jackson, will be resumed next month.

The Nevada State Journal says the monthly product of the Nevada-Keystone mine, in Yellow Pine district, near Sandy, is \$40,000. The mine is worked to the depth of 700 feet and has a 30-ton cyanide plant.

NEW MEXICO.

GRANT COUNTY.

The Silver Cell mine, at Pinos Altos, has been sold for \$100,000 to the Shamrock M., M. & S. Co.

SIERRA COUNTY.

Q. Vance, working on the Columbia mine, near Fairview, reports opening up a shoot of silver-copper ore. A mill is being installed at the Silver Monument mine. The Wing mill is being moved from Mineral creek to its new site near Kingsbury camp, on Poverty gulch, and a cyanide plant will be added to it. The Minnehaha mine is being developed by shafts and levels to open up stoping ground pending the completion of the mill. The iron mines of Scales & Scales, near Edwards camp, in the Cuchillo, are being worked. The tunnel of the Confidence mine, 6 miles farther south, owned by the same company, is in several hundred feet and being driven 4 feet a day.

OREGON.

BAKER COUNTY.

Manager T. W. Davidson of an Eastern company which has a bond on the Olympia group, of the Cracker Creek district, near Sumpter, says development work has begun. The Olympia is between Sardine and Big Cracker creeks, and may be opened from either of these drainages. Tunnels have been driven on both, with ore in each, but the principal shoot is on the Sardine side, opening ore that assayed \$39. Four quartz claims and one placer are in the group.

The Connor Creek placers, 17 miles down Snake river from Huntington, are the objects of a small rush to locate claims, says the Spokesman-Review. The Connor Creek Placer M. Co. owns 200 acres of placer ground, and the washings from the Connor Creek M. & M. Co. workings. One giant and bedrock flumes are used. Some quartz locations have been made. The Connor Creek M. & M. Co. will start up the 40-stamp mill again this season.

President Hays of the Beaver M. Co. says a 16-drill air compressor will be put in at the Baisley-Elkhorn mine on Elkhorn mountain near Sumpter. The compressor will not be used to operate power drills for the present, but to pump the mine out, preparatory to resuming development.

One of the crosscuts being driven by the Western Union Co., J. A. Hilliker, manager, near Sumpter, has cut the vein, showing 20 feet of milling quartz. The company is also operating the Monte Cristo group and the Innana (a copper property).

Superintendent Beckwith of the Orleans mine, near Sumpter, says a hoist will be installed to be run by electricity, as water power is not available.

A power plant, hoist and pumps will be installed on the Minersville group, in Minersville district, near Sumpter, says T. J. McWatty, treasurer of the company.

The Highland G. M. Co., N. J. Sorensen manager, have bought the Knapp group of claims, near Sumpter, for \$45,000. The group contains twelve claims, water

rights and a millsite, with an abundance of timber at hand.

The Sumpter Miner says thirty additional stamps are to be put in next month at the North Pole mine, near Sumpter, making a total of sixty stamps.

A compressor will be installed at the Gold Bug, near Sumpter, by April 15, and more men put on development work. The company will erect a 10 stamp mill next summer.

Superintendent R. Addoms of the Alpine mine, in Cable Cove, near Sumpter, says work will be resumed and a mill will be installed this summer.

The Gelsier-Hendryx Investment Co. will put in a hoist, with capacity for 500 feet, and pumps at the Gold Pan mine, near Sumpter.

A 10-stamp mill will be installed at their mine, says Manager A. E. Patterson of the Octo G. M. Co., in the Baisley-Elkhorn mountains, near Baker City.

A considerable flow of water has been struck in the crosscut from the Cracker-Oregon shaft, near Sumpter, on the 100-foot level, requiring the installation of a pump, says Superintendent Watters.

A 10-stamp mill will be erected this summer at the Blue Bird mine, near Sumpter, says Superintendent Thorpe. Four feet of ore has been opened up in vein No. 1, assaying \$35 in gold.

A. H. Huntington will operate a group of placer mines on Gimlet creek, near Whitney, this spring.

GRANT COUNTY.

Drifts on the vein of the Dixie group from the crosscut driven to the vein by Ray & O'Neill, owners, have opened 26 inches of milling quartz and they propose to install a mill. The Dixie group is 5 miles from the Dixie Meadows mine, near Prairie City.

Superintendent Brady of the Belcher mine, near Alamo, is having lumber and other material hauled from Whitney to build a hoist and other buildings. The Belcher is developed by tunnels, the main adit being in 1200 feet. It crossed three shoots of ore, and sinking will begin on one of these. Brady says a mill will be installed.

The Belcher mine, near Alamo, will have a stamp mill this season, says G. W. Daines, president of the Daines G. M. & M. Co., which owns the Belcher and adjoining group.

JOSEPHINE COUNTY.

Manager H. Wood, of the company which has taken up the claims showing jade recently found on Althouse and Indian creeks, near Althouse, says development work will begin next week.

At the Hall group of mines on Grave creek, owned by J. & G. Hall of Grant's Pass, development has uncovered a body of black oxide of manganese in quartz which carries values in gold.

While pipping at the lower end of their placer diggings on Galice creek, near Grants Pass, the St. Helens & Galice Co. recently struck an unexpected channel that is yielding pay. This channel is found to extend for several hundred feet along the creek and to carry values through its whole extent.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Jupiter plant, near Deadwood, resumed last week, says Superintendent Sanders. The mill has 150 tons daily capacity and treats by wet crushing cyanide and amalgamation.

The Columbus Con. G. M. Co. has resumed operations at its cyanide plant on Blacktail gulch, near Central City, after an idleness of several months, pending the addition of tanks. The capacity has been increased to eighty tons a day.

The Titanic M. Co., near Carbonate, expects to resume work by April 15. The shaft will be continued to quartzite and drifting begun.

More vats are to be placed in the cyanide plant of the Dakota M. & M. Co., near Deadwood, as the tankage is not sufficient for the crushing capacity. The annual statement issued by the company shows a net profit of \$1.18 per ton realized on ore averaging \$4.11 a ton, over cost of mining, haulage by railroad for 10 miles, and treatment. Their mineral occurs in the siliceous ores of the Cambrian.

PENNINGTON COUNTY.

The Standard Essence Co. of Maywood, N. J., have contracted for the shipment of thirty tons per month of spodumene from the mines owned by M. Everly, D. Swanzy, et al. The price received is \$12 per ton on board the cars in Keystone.

The Columbia M. & M. Co. are installing a hoist and air compressor at Rockford, says Superintendent L. M. Kearney.

UTAH.

BEAVER COUNTY.

The Milford Metal Mines Investment Co. have opened a 9-foot deposit of tripoli

lite on their Paradox claims at the hot springs, in Granite district, near Milford. At a depth of 25 feet the shaft cut a blanket deposit. After passing through the tripolite the shaft entered a body of iron-bearing material. The company has applied for patents on its two lode claims and millsite.

J. Leyshon, formerly of Silver City, is taking ore out of the Beacon mine in the Star district, near Milford, on which he has a lease.

A. Buchanan and D. McKinnon, who hold a bond on the Old Elephant mine, in the Star district, near Milford, have resumed work on the tunnel, in 360 feet, with 100 feet more to cut the vein at a depth of 190 feet. The vein carries silver-lead ore. Mr. Buchanan has bought the Pine Tree claim, adjoining the Elephant.

The Milford C. M. & S. Co. has been organized at Salt Lake City to develop the Blue Jay group of eleven claims south of the Ben Harrison, near Milford; G. H. Dern, F. Y. Taylor, C. E. Hudson, H. Dinwoodey, E. H. Alris, G. Romney and F. H. Lathrop, who is manager.

BOX ELDER COUNTY.

Manager A. R. Carter of the Pine Canyon mine, Park Valley, says a strike has been made in the tunnel being driven to catch a vein which outcropped on the top of the hill. At 465 feet in the vein was cut, showing good values. The company own a water right and have surveyed a ditch which gives a vertical fall of 300 feet to the millsite, and it is intended to erect a mill next summer.

GRAND COUNTY.

The Grouse Mountain M. Co. have started work on their oldings north of Basin, says W. R. Wheat, manager.

L. W. Dutro, president of the Grand View mines, near Basin, says work is resumed on their tunnel into Horse mountain. They have a vein of hematite ahead of them that will require a crosscut tunnel of 400 feet.

M. G. Fowler, superintendent of the Tornado M. Co., says operations will be resumed next week, a crosscut driven and ore extracted from the old workings, which show free milling gold ore.

IRON COUNTY.

Manager Parker of the Ophir of State-line says heavier machinery will be put in and the mill will be changed to a cyanide plant.

JUAB COUNTY.

A winze is being sunk on a silver-lead body of ore from the 1100 foot level of the Mammoth mine, near Eureka, says Manager S. McIntyre. It is down 35 feet.

The equipment for the new mill of the Four Metals Co., near Fish Springs, in Dugway mining district, is on the ground, says Manager Moats, and construction work begun.

The Tintic Miner says the South Swansea mine at Silver City will resume. C. Wheeler is superintendent.

PIUTE COUNTY.

A company of Chicago men are arranging to drive a tunnel in Revenue gulch, near Marysville, to tap the copper belt ores. Only surface mining has been done heretofore and it is intended to drive the tunnel 4000 feet to tap the mineral belt at a depth of 2000 feet.

SALT LAKE COUNTY.

The Boston Con. M. Co., operating at Bingham, propose to install a smelter at their mines of 500 tons daily capacity, says the Salt Lake Tribune.

Manager Thomas of the Maxfield M. Co., operating in Big Cottonwood canyon, near Alta, says he will increase the power plant by an auxiliary water wheel.

The Old Evergreen M. Co., on the divide between Big and Little Cottonwood canyon, near Alta, report developments in the ledge followed for several hundred feet, have opened on the hanging wall 8 inches of ore which averages 10% copper, with some silver and gold. The tunnel is being driven ahead through the porphyry dyke.

C. J. Hodge, owner of the Last Chance mine and mill at Bingham, says he has arranged to resume work on the Last Chance next week.

The Utah Con., operating at Bingham, which until recently had its headquarters in London, has incorporated under the laws of New Jersey as the Utah Con. Mines Co.

After a month's idleness, due to bad roads preventing delivery of coal, operations were resumed at the St. Joe mine, near Bingham, last week.

SUMMIT COUNTY.

Superintendent C. H. Gitsch of the California mine in Thayne's canyon, near Park City, reports the new shaft down 150 feet and drifting begun on the tunnel level to connect this shaft with the mill. When this is finished sinking will be resumed.

Pending these developments, the holsting plant and the mill are closed down.

The 500-foot level has been reached at the Little Bell mine, near Park City, and Superintendent McDonald has men drifting to open up the vein at this depth, after which it is expected shipments will resume.

SUMMIT COUNTY.

The Avondale M. Co., L. Moore of Cincinnati, O., president, have begun development work on their property adjoining the Nalldriver mine, at Park City.

The Silver Bell mine of Park City, after a shut-down of several months, resumed work last week.

TOOELE COUNTY.

A. C. McKendry of the Montana Con. mine of Ophir gulch, near Ophir, says the drift being run from the shaft on the 200-foot level is in 200 feet and nearing the vein. Machinery will be put in and a change made from hand to power drilling.

The electric power and lighting plant being constructed in Ophir canyon is nearing completion. It will furnish electricity for W. A. Clark's Ophir Hill mine and mill.

At the Honorine mine at Stockton Superintendent Raddatz says the air compressors, with other machinery, are in place, and next week the machines will be operating in the tunnel.

UTAH COUNTY.

The shipping of lime rock from the quarries in Twelve Mile pass in Rush valley, near Lehi, has been hindered lately by bad roads. The Hudson interests in the company have been sold to J. Wing, R. Steele and E. W. Ross. They have put up water tanks at the Rush Valley switch and a set of scales to weigh the wagons. J. Wing has a lease on the group and says besides shipping to the smelters he will ship 1000 tons to the Lehi sugar factory, the rock showing on analysis but 0.12% silica, with the balance lime.

WASHINGTON COUNTY.

A. B. Lewis has taken an option on a group of copper claims west of the Utah & Eastern Co. group near St. George.

WASHINGTON.

FERRY COUNTY.

Machinery has been installed at the Lucille Dreyfus mine, near Republic, and operations resumed. They are crosscutting from the bottom of the winze.

The Pioneer-Miner says Superintendent Newton of the Mineral Hill mines at Danville received orders to close down last week.

OKANOGAN COUNTY.

J. P. Blaine, superintendent of the Opal G. M. & M. Co. on Myers creek, near Chasaw, has men at work on the Ben Harrison group and is continuing development on the Opal. The crosscut is being driven ahead and has 350 feet yet to go to cut the vein. Superintendent Smalley of the Oregon mine has men at work on development.

SNOHOMISH COUNTY.

Ore is being drifted on in the North Star mine, near Silverton, assays returning 30.2 ounces silver, 0.10 ounce gold and 20.4% copper per ton.

A tunnel has been started on the Bitter Creek mine, near Silverton, 60 feet below the upper one. The upper tunnel was run 70 feet in chalcopryite. The object in running this drift is to locate the ore shoot, so that a working tunnel can be driven this summer to place the mine in a position to ship their ores.

STEVENS COUNTY.

Manager J. M. Fish of the Columbia River G. M. Co. says they will install a reduction plant at the mines east of Meyers Falls. There are 2000 feet of development work done, with one shaft 150 feet in depth, sunk on the ledge. From the bottom of this shaft a crosscut of 245 feet was run. This vein shows average assays of \$10.54 in gold.

WYOMING.

UINTA COUNTY.

The Beatrice Oil Co. of Nebraska are drilling at Fossil.

The Idaho-Wyoming has attained a depth of 1300 feet.

Over twenty new rigs will be put in commission in the Spring Valley field during April.

The American Con. Oil Co. are working most of their rigs in the Spring Valley field.

Superintendent J. A. Beverly of the Uintah Oil Co. says he has his rig on the ground and drilling will begin as soon as the snow will permit successful work.

The White Star Oil Syndicate has its well down 600 feet and Manager Moore

expects to get the oil sand with 400 feet more drilling.

FOREIGN.

AFRICA.

GOLD COAST.

P. Tarbut reports development on the mines of the Wassan Co. as follows: Total length of reef proved at the 400-foot level, 1500 feet. The average value of the ore over its entire length is in excess of 24 ounces per ton for a width of 18 to 20 inches. In the 500-foot level, about 200 feet has been driven, the average assay value being 4 oz. 6 dwt. for an average width of 14 inches. The shaft is down to the 600-foot level, and the average value in the shaft from the 400-foot to the 600-foot level was 5 oz. 2 dwt. for an average width of 16 inches. The mill has 3500 tons capacity.

AUSTRALIA.

QUEENSLAND.

Returns for the month of February were as follows:

Mine.	Tons Crushed.	Yield in Ounces.
Charters Towers.....	24,700	36,100
Croydon.....	3,100	3,400
Gympie.....	14,900	14,200

BRITISH COLUMBIA.

It is stated that the Crofton smelter blew in on the 20th inst. There are 30,000 tons of ore on the roast heaps. Ore is being regularly delivered from Quatsino sound and White Horse, and ore bunkers have been built at the end of the wharf.

J. L. Parker, manager of the North Star mine at Klmberry, East Kootenay, says development is progressing and forty men are at work.

From the Arlington mine at Erie, Lessee J. Muffett last week shipped three cars of ore to the smelter, giving net returns of \$3318 80.

At the Copper Farm mine, in the same district, Superintendent G. H. Green has opened up a body of low-grade ore. Over 1000 feet of tunneling has been done, and the vein has been crosscut at a depth of 450 feet, showing it 25 feet wide.

W. Blackmore, consulting engineer for the Ashnola Coal Co. at Princeton, has started diamond drill work. A hole is to be drilled a mile east of the one sunk last season, in which a 10-foot seam of coal was cut, at a depth of 700 feet.

The Trill smelter's operations are confined to one lead stack, the remaining lead stacks and copper furnaces having been closed, owing to the coke shortage. Como coke is being delivered at the plant, and when a sufficient reserve is accumulated the company will blow in its copper furnaces.

On Princess Royal island, at the Homestake group, being worked by W. Howden, M. McMillan, R. W. Nowell and B. J. Cliff, 350 feet of tunnel have been driven on the Homestake lead and 50 feet of tunnel on the Anaconda. The ore is gold quartz, with pyrite, assaying \$20. The owners intend to ship the ore to the nearest smelter, as soon as the snow melts.

The Cariboo Gold Fields Co. will install machinery for development of their mines near Barkerville.

In the Similkameen valley, 26 miles from Penticton, the Challa C. M. & S. Co. propose to install a smelter, says Secretary E. Mirandon of Paterson, N. J.

M. L. Moyer has a working bond for a year on the Horseshoe mine, near Trout lake, and adjoining the Lucky Boy.

The Cariboo Creek Development Syndicate, owning the Mohican mine, near Lardeau, will resume work next week. The tunnel in which an ore body was struck last fall will be continued.

O. J. Johnson, K. Neitzel et al. have incorporated the St. Eugene Mountain Co., to work a group of claims adjoining the St. Eugene at Moyle.

The Wakefield mine, near Slovan City, will start operations next week.

Notwithstanding the Fernie strike and complete shut-down of all the Boundary smelters, mining at Greenwood is not at a standstill, says the Rossland Miner.

The Atlin Claim says on Spruce creek, near Atlin, seventy men are wintering, fifty, at least, of whom are taking out large dumps. The benches and hills consist of a hard conglomerate gravel, extending from 200 to 500 feet on each side of the creek and for 2 miles up the creek, commencing at 130 below discovery. This gravel carries values averaging 3 cents to the pan. No timbering is required and the drifts are being run 15 feet wide.

The Kootenay Placer M. Co., on Perry creek near Fort Steele, have installed a

sawmill to equip the mine with flumes and buildings.

It is the company's intention to resume work at the Splitzee as soon as weather conditions permit, says F. A. Hewer, managing director of the Splitzee Co., at Rossland. It is proposed to construct new headworks at a more central point on the group, the boundaries of which have been enlarged by the addition of the Derby and Nelson No. 2 claims. A compressor plant will also be installed, with a hoist, capacity 500 feet.

Since the problem of concentrating ores of Rossland camp was first considered one of the objections raised was the inadequate water supply, says the Spokane Spokesman-Review. Violin lake is 4½ miles southeast of Rossland, affording a natural reservoir, but its location below the level of the mines led to the impression that its waters could not be used for milling purposes. H. B. Smith, a civil engineer of Rossland, has run levels and ascertained that he could deliver water within 400 feet of the south boundary of the townsite, at which point ores could be delivered by tramway at low cost. The Violin Lake Power & Water Co. has been organized, securing water records for 500 miles' inches from Violin lake, and will build a steel pipe conduit from Violin lake to the city, whereby water to mill 5000 tons per day can be delivered, at a cost on construction account of \$100,000.

Superintendent L. E. Beck of the Eva mine at Camborne, in Lardeau district, says the owners (the Calumet & British Columbia Co.) have authorized the installation of thirty additional stamps to the mill, reports the News-Advertiser. The survey for the tramway, 4200 feet in length, from the millsite to the upper tunnel, being driven, has been made. It is planned to have this tramway in operation by July 1. Two tunnels are being driven, the lower of which will tap the upper workings at a vertical depth of 700 feet. This will be used as the main working tunnel until a tunnel has been driven on the same level as the millsite, which will give a depth of 2500 feet.

C. Wolfe, manager of the Golden Monarch Co., of Spokane, Wash., operating the Foghorn mine at Ymir, reports in the crosscut at 800 feet from the portal a pay-shoot of sulphide ore struck, 18 inches wide. This is believed to be a stringer from the main vein, for which the tunnel is being driven.

The Nickel Plate Co., in Hedley camp, are installing a 40-stamp mill. The tramway will be ready for operation by May 1st, says Manager Munson. A flume will convey water from Twenty Mile creek to the mill. Electric power will be used and the tram will be run partly by electricity and partly by gravity.

BRITISH GUIANA.

The gold entered at the custom house, Georgetown, on Feb. 28, for shipment, amounted to 2657 ounces 8 dwt. 4 grains, valued at \$46,803 96. Export from Jan. 1 to Feb. 10: Gold, 1903, \$72,850.72; 1902, \$162,855.16; diamonds, 1903, 562 carats, value \$4129; 1902, 1147½ carats, value \$14,580; kaolin, 1903, — tons; 1902, 500 tons.

Concerning the diamond industry, the Demerara Chronicle of Feb. 11 says: The British Guiana Diamond Syndicate's boat returned from the Massaruni district on the 30th ult., bringing 505 diamonds, which weigh 77 carats. By comparing the number of stones with their weight, it will be seen that these are fairly large diamonds, and it is stated that there are several which are 1½ carat in weight. They were gathered in a short time. The stones were found in the Massaruni district.

On Feb. 6 J. Menzies of the Massaruni Co., Ltd., deposited at Georgetown diamonds equal to 368½ carats, and 3497 diamonds, weighing 172 carats, were entered at the office of the Department of Mines from the Demerara Diamond Co.'s claims in the Massaruni. Many of the stones were of good size.

CHILE.

There is but one district of importance in Chile which produces gold. This lies 42 miles southeast of Cuevitas, on the Antofagasta Railway. The mines were discovered in 1882 and have been worked since with difficulty, owing to the lack of water. This has to be taken up from the railway and costs \$4 gold a ton. The country rock is rhyolite and the lodes are quartz. The gold is found free, with little or no pyrites, but there is a good deal of carbonate of lead and silicate of copper. The principal mines are the Bolaco, Palmira, Pobre Diablo, Bolaquito, etc. The deepest is the first named—300 feet. The Palmira has a tunnel 600 feet in length along a 3-foot lode which averages one ounce to the ton. The Bolaco has given rich ore in a vein 2 to 3 inches wide which accompanies the lode.

The production is about 100 ounces monthly.

MEXICO.

CHIHUAHUA.

Manager T. H. Oxnam of the Palmarejo mine, west of Chihuahua, shipped last week 3000 pounds of cyanide slimes containing silver and gold valued at \$135,000 gold, from one month's cleanup.

In the Batopilas mines, at Batopilas, a four-ton gasoline locomotive is in operation. It was built in sections of not over 300 pounds each, so as to be packed in.

A new silver camp, called San Blas, is started in the San Blas mountains in the Gallana mining district, 2 miles from Guzman.

A company has been organized in Monterey, N. L., to exploit the El Rosario mine, near Parral. B. Reyes, A. G. Galan, I. M. Zaragoza, E. Ballesteros, J. Maria, G. and J. G. Galan and J. Reyes, directors.

DURANGO.

The Penoles M. Co., of Mapimi, will build a railway from its gold and silver mines to San Pedro del Gallo, to develop its coal fields at that place.

NUEVO LEON.

The Reforma mine, owned by M. Gugenheim Sons, is shipping 150 tons per day to smelter No. 3 at Monterey.

OAXACA.

The Natividad mine, on the line of the Oaxaca and Ejutla Railway, in six days run of its mill last week yielded 15,674 ounces of silver and 489 ounces of gold, which may be taken as an average run, says the Chihuahua Enterprise. The expense for labor during the six days run was \$3000.

Gold is reported found in Tuxtepec on the Gulf slope of Oaxaca.

SONORA.

The International C. & G. M. Co. is working the Pedregal gold mine and the Australia silver mine near Alamos. The vein of the Pedregal is reported 17 feet wide and a shaft down 60 feet has opened up the ore shoot.

The Hidalgo M. Co. has been incorporated under the laws of Arizona, to operate three groups of mines (one copper, a silver-lead property, and the third gold) in northern Sonora. The copper group consists of 80 pertenencias (175 acres) 6 miles west of Nacoziari. A tunnel and three shafts from 70 to 80 feet in depth have been driven in ore that runs 15% copper and \$2.50 in gold.

An El Paso, Texas, report says the Astor and Jumbo mines have been sold to Michigan men for \$50,000 gold, and concentrating machinery will be put in. These mines are silver-lead and undeveloped, near Moctezuma, and 20 miles from the Dos Cabezas mine.

NEW ZEALAND.

The Keep-it-Dark Quartz M. Co., Reefton, report for 1902: Battery yield, 2392 ounces gold, value £9607, and 1409 ounces, value £4210, from tailings treated by cyanide. There are fifty-one men employed by the company, which has claims of 118 acres at Crushington, near Reefton.

The Champion G. M. Co. is operating a bank-and-river claim on the Molyneux river, between the Golden Mile and Golden Gravel companies, 1 mile from the Beaumont Bridge, and has also an area of sluicing ground, to work which water is brought 4½ miles from the Little Beaumont river. — The Earnsclough Gold Dredging Co. has two dredgers operating on two claims on the west bank of the Molyneux river, near Alexandra, and last year took out 4543 ounces gold, value £17,720. They have twenty-three men at work and expended last year £8625.

The Waitaha Gold Mines, Ltd., operating at Kuatunu, in the Hauraki mining district, obtained 1433 ounces gold, value £4118, during the past year, with twenty-two men at work.

The Stafford-Waimea Gold Dredging Co. obtained from last year's dredging 566 ounces of gold, value £2291, expending £2150 to carry on operations. The company has two claims, comprising ninety acres, with the option of purchasing sixteen acres of freehold, along Waimea creek, at Stafford Town, in Westland.

The Cromwell Gold Dredging Co. is working a river claim of thirty-two acres, it being 1 mile in length on the Kawarau river, between the Electric and Junction Electric Companies, last year taking out 2815 ounces of gold, value £10,899.

The gold output of New Zealand mines for February was 16,238 ounces, valued at £50,051, as compared with 41,632 ounces, valued at £161,197, for the corresponding month of 1902. It is expected that March returns will be very large, as it is reported that a large quantity was held for export last month for trade purposes.

TASMANIA.

Mount Lyoli M. & R. Co. returns from January 8 to February 4, inclusive, says the Australian Mining Standard, show a total of 22,958 tons of ore treated, the average assay of the ore being copper 2.13%, silver 2.11 ounces, gold .071 ounce. In addition to the above there have been treated during the same period 3560 tons of purchased ore and metal-bearing fluxes. The converters have produced during the same period 456 tons of blister copper, containing copper 451 tons, silver 45,044 ounces, gold 1616 ounces. From December 11 to January 7, inclusive, a total quantity of 23,212 tons of ore was treated, the average assay of the ore being copper 2.23%, silver 2.05 ounces, gold .069 ounce. In addition to the above there was treated during the same period 3201 tons of purchased ore and metal-bearing fluxes. The converters produced during the same period 507 tons of blister copper, containing copper 500 tons, silver 46,289 ounces, gold 1553 ounces.

At the North Mount Lyoli about 1200 tons a week is the maximum output. At Crotty all work in the shape of construction has been suspended, and at present operations are confined to concentrating and smelting. About 100 men, including some minor officials, have been discharged.

Lake City, Utah, from an examination of mines at De Lamar, Nev.

J. F. ROWELL, manager U. S. Gold Incorporation, at Eldora, Colo., is in the East on company business.

R. H. HERRON, interested in the southern oil fields, is in San Francisco, Cal., from Los Angeles, Cal.

C. W. CONKLING of Tekama, Mex., returned from a trip to Boston, Mass., on mining business last week.

G. E. TAINTER of New York City, who is interested in Western mining properties, is in San Francisco, Cal.

G. W. BOYCE has returned to Chihuahua, Mexico, from a business trip to Boston, Mass., and Bangor, Me.

W. ADAMS has returned to Chihuahua, Mex., from New York, N. Y., where he has been on mining business.

T. B. DILLON has resigned as superintendent of the Montezuma mine, near Nashville, El Dorado county, Cal.

J. BROAN is superintendent of the Tiger G. M. Co. in the Bradshaw mountains, southeast of Prescott, Ariz.

A. B. SIMONSON and J. MACNAUGHTON of the Calumet & Hecla mines, Calumet, Mich., are in Salt Lake City, Utah.

L. M. KEARNEY of the Columbia M. Co. of Rochford, S. D., returned last week from a trip East on mining business.

W. H. HILL is in charge of construction of a 40-stamp mill for the Mojave G. M. Co., 8 miles north of Needles, Cal.

B. MACDONALD, of Spokane, Wash., consulting engineer for Le Roi M. Co., at Rossland, B. C., is in New York City.

PRESIDENT J. D. HAGUE of the North Star mines, Grass Valley, Cal., has returned there from San Francisco, Cal.

W. H. YANKEE, of Denver, Colo., is president of the Idaho-Colorado G. M. Co., Ltd., operating near Pearl, Idaho.

F. A. HEWER, managing director of the Spitzee M. Co., has returned to Rossland, B. C., from an extended trip to England.

R. A. HOLLEY, of Berkeley, Cal., is assayer for the Mammoth G. M. Co., near Lewiston, Mont., vice Anderson, resigned.

C. M. WARD, owner of the Starlight and Riverside mines at Grub Gulch, Madera county, Cal., is in San Francisco, Cal.

W. C. GREENE, president of the Greene Con. C. Co., has returned to La Cananea, Sonora, Mexico, from a trip through California.

J. P. GORDON is superintendent of the Montezuma mine, near Nashville, El Dorado county, Cal., vice T. B. Dillon, resigned.

M. G. FOWLER, superintendent of the Tornado M. Co., near Basin, La Sal mountains, Utah, has returned from Chicago, Ill.

SUPERINTENDENT E. R. ABADIE of the Champion M. Co. at Nevada City, Cal., is in San Francisco, Cal., on a business trip.

F. E. WILSON, manager Friday mines and mill, near Baker City, Or., has returned to Salt Lake City, Utah, from Baker City.

H. L. CARVER of San Francisco, Cal., has gone to the drift mine of which he is manager near Sheep Ranch, Calaveras county, Cal.

W. C. ALEXANDER of the Diamond Con. M. Co. has returned to Lafayette, Ind., from an examination of their properties at Stockton, Utah.

J. P. OWEN, manager of the Sierrita M. & M. Co., operating in Pima and Santa Cruz counties, Ariz., is in New York City on mining business.

R. DE LARGE has completed a 10-stamp mill for the Cumberland M. Co. at Dewey, Ariz., and will begin the development of the Omega mines, near Goodwin, Ariz.

SUPERINTENDENT E. A. STENT of the Dolores mine and G. H. Beveridge, one of the owners, returned last week to Chihuahua, Mex., from Mexico City, Mex.

B. P. HOWELLS, superintendent of the Dalton mine at Marysville, Utah, has gone to Virginia City, Nev., to recuperate, having been in ill health for some time.

C. F. HUMPHREY and B. GOODWIN, directors of the Mt. Jefferson G. M. Co., have returned to San Francisco from a visit to their mines near Groveland, Cal.

J. F. PARKES, superintendent Kennedy mine, Jackson, Amador county, Cal., is at Palm Springs, Riverside county, Cal., but will go to Phoenix, Ariz., for his health.

H. G. STOKES has left the Silver Spur mine, Texas, and has been appointed gen-

eral manager of the Glassford Creek Copper M. Co., Ltd., Gladstone, Queensland.

J. B. HASTINGS, former manager of the War Eagle mine at Rossland, B. C., has returned to New York City from an examination of mining interests in Idaho.

G. H. ROBINSON, manager of the Tintic M. & D. Co., returned to Salt Lake City, Utah, last week from Butte, Mont., and has gone to New York on company business.

E. H. BLAKE of Brocton, Mass., president of the Fanny Marie M. Co., returned East this week after a visit of inspection to the company's mines at Mokelumne Hill, Cal.

N. TREWEEK, who for years was foreman of the Homestake mine at Lead, S. D., has been appointed superintendent of the Hidden Fortune mines, near Central City, S. D.

E. B. SMITH, A. AND J. BAUMAN, of Fremont, O., members of the Swiss-American M. Co., have returned to Fremont, O., from a visit to their mines near Kingman, Ariz.

O. B. STEEN of Tombstone, Arizona, president, and A. F. Barnett of San Francisco, Cal., vice-president of a company operating placers near Altar, Sonora, Mex., are at their mines.

G. C. ASCHBACH of Allentown, Pa., treasurer of the Colorado & Northern G. M. Co., with S. H. Roseberry of New Haven, Conn., a stockholder of the same company, are visiting their mines at Wall Street, Colo.

EUGENE COSTE of Rossland, B. C., engineer of the Provincial Natural Gas & Fuel Co., has been elected president of the Canadian Mining Institute, and E. B. Kirby of Rossland, J. H. Tonkin of Ferrie and S. F. Harris of Eholt were elected to the council. It was decided to hold the next annual meeting in Toronto, Canada.

S. S. GLIDDEN, a pioneer miner of the Cœur d'Alenes, Idaho, died at Los Angeles, Cal., on the 17th inst. He was in his 71st year.

N. S. KELLOGG, one of the discoverers of the Bunker Hill & Sullivan mine at Wardner, Idaho, died at his home in Kellogg, Shoshone county, Idaho, on the 17th inst., aged 71 years.

FRANKLIN BALLOU, a pioneer smelterman of Colorado, former vice-president and general manager of the Bimetallie Smelter Co., died on the 20th inst. at Palm Beach, Fla., of pneumonia. Deceased was 56 years of age and leaves a widow, one daughter and two sons.

H. B. SMITH, underground superintendent of the Commonwealth mine at Pearce, Ariz., was killed on the 24th inst. While mounting the ladder 200 feet from the bottom of the shaft, a short distance above which timbers had been placed across the shaft to keep the car from going below that level, the car was ascending with a load of ore and the cable broke, the car and contents crashing through the timbers and hurling Mr. Smith to the bottom.

Commercial Paragraphs.

THE C. H. BESLY Co. of Chicago, Ill., will move into their new building on Clinton St., between Randolph and Washington Sts., about April 15.

PAWLING & HARNISCHFEGGER, crane and hoist builders, Milwaukee, Wis., expect to move from their present location on Clinton, Oregon, Barclay and So. Water Sts. to a new site just purchased on National and 38th Aves.

W. B. ROBERTS, assayer and chemist, formerly with the Phillips Ore Testing Works of Denver, Colo., has secured the assaying establishment of Jas. A. Shedd, at 105 E. 1st St., Los Angeles, Cal., and will pay particular attention to cyanide, concentration and amalgamation tests.

THE Westinghouse Co. will erect a new foundry 320x55 feet wide, to be constructed of brick with steel frame. This foundry will be located west of the present air brake works at Wilmerding, Pa., and has been made necessary by the greatly increased demand for castings used in the apparatus manufactured by this company. This addition to the plant will increase the company's working force, now numbering 3000 men.

Books Received.

"How to Become a Competent Motorman," is a practical treatise on the proper method of operating a street railway motor car. The authors, V. B. Livermore, chief constructor of the Brooklyn Rapid Transit Railroad, and J. Williams, shop foreman of the same company, have given motormen in this little volume information which every motorman should have and which is also of interest to all who ride on electric cars; 232 pages, with numerous illustrations. D. Van Nostrand Co., New York. Price \$1.

"Chemical Technology, or Chemistry in Its Application to Arts and Manufactures," is the title of Vol. IV of a series of books on lighting, edited by W. J. Dibble, with "Electric Lighting" by A. G. Cooke. The volume also includes Richardson & Watts' "Chemical Technology." It is a work especially valuable to specialists in electrical industry who may wish for a resume of all the various systems, machinery, lamps, etc., in use for the supply of electric lighting. The work may be read with facility by any one who has an elementary knowledge of electricity. The section relating to photometry has been carefully compiled with a view to the full description of existing and proposed standard methods of determining the visual intensity of artificial illumination. 378 pages, 181 illustrations. Price \$3.50 net. P. Blakiston's Son & Co., 1012 Walnut street, Philadelphia, Pa.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MARCH 17, 1903.

723,191.—WOMEN'S SKIRT—Augusta Adler, Tacoma, Wash.
723,193.—HAT HOOK—H. R. Bernard, S. F.
723,128.—HOISTING CRANE—W. E. Boden, Pasadena, Cal.
723,805.—SHARPENER—Buckley & Brown, S. F.
723,952.—TRUCK—G. W. Davis, Vacaville, Cal.
723,830.—TREAD POWER—W. De Graw, Clovis, Cal.
723,840.—RECORD FOR HORSES—D. W. Donnelly, Burlingame, Cal.
723,967.—PIANO—A. G. Gardner, Los Angeles, Cal.
723,837.—AIR BRAKE—F. L. Guillemet, S. F.
723,840.—PRUNE PRICKER—J. H. Hammer, Medford, Or.
723,703.—WATER HEATER—Haug & Brown, S. F.
723,614.—MASSAGE APPARATUS—W. F. Hedstrom, Los Angeles, Cal.
723,155.—STUMP PULLER—C. G. Hoffmann, Needy, Or.
723,192.—ROTATING BOAT—A. Kitterman, Portland, Or.
723,720.—CONVEYER—F. H. Lamb, Hoquiam, Wash.
723,721.—CABLEWAY—F. H. Lamb, Hoquiam, Wash.
723,806.—OIL BURNER—H. Luckenbach, Seattle, Wash.
723,101.—AIR COMPRESSOR—G. W. Marsh, Oakland, Cal.
723,010.—OIL BURNER—McLean & Picard, S. F.
723,867.—HOISTS—G. Mitchell, Naco, Ariz.
723,868.—TRAVELING CRANE—G. Mitchell, Naco, Ariz.
723,876.—GAS REGULATOR—C. L. Nelson, Seattle, Wash.
723,897.—BROILER—F. Rademacher, Los Angeles, Cal.
723,899.—TOOL HANDLE—C. V. B. Reeder, San Jose, Cal.
723,619.—THRESHER—J. J. Skinner, Paso Robles, Cal.
723,762.—CALENDAR SUPPORT—F. H. Smith, S. F.
723,946.—LOCK—S. Storm, Los Angeles, Cal.
723,220.—PISTON PACKING—E. W. Tucker, S. F.
723,082.—SCREW—I. S. Turner, Centralia, Wash.
723,890.—BRAKE—E. Wade, Los Angeles, Cal.
723,083.—RECORDING SHOES—N. S. Wakefield, Los Angeles, Cal.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BITS FOR HORSES—No. 722,682. March 17, 1903. D. W. Donnelly, Burlingame, Cal. The object of this invention is to provide a bit and means for guiding horses which can be securely fixed in the mouth of the horse without the necessity of headstall or other disfiguring straps, and to provide a structure of sufficient rigidity to give the rider the necessary leverage upon the mouth of the horse to enable him to control the animal. It is especially designed for riding, but may be used for driving horses. The device consists of a suitably shaped piece of metal, of curved, oval or other form in cross-section, and of such dimensions that the upper portion will extend across from side to side of the mouth of a horse, and from the end of this portion it curves around beneath the lower jaw of the horse.

COMPOUND AIR COMPRESSOR.—No. 724,001. March 17, 1903. G. W. Marsh, Oakland, Cal. This invention consists, essentially, in the combination with high-pressure motor and air cylinders arranged in line, pistons reciprocable therein and movable in unison, and means for supplying fluid to said motor-cylinder, of supplemental or low-pressure motor and air cylinders, pistons movable in unison in said cylinders, connections between the high-pressure and low-pressure motor cylinders whereby the exhaust from the first is utilized as a motive power to drive the piston in the second; inlet ports in each of said air cylinders and connections between said cylinders whereby the exhaust from the low-pressure air cylinder is delivered into the high-pressure air cylinder and the amount of air in the latter increased by the amount of air thereby delivered, so that the act of compression by the piston of the cylinder so

PERSONAL.

S. MARTIN, of St. Paul, Minn., is in Reno, Nev.

F. MCGURRIN of Salt Lake City, Utah, is in the East.

G. STANDART, of Plumas, Cal., is in San Francisco, Cal.

S. BAMBERGER of Salt Lake City, Utah, is at De Lamar, Nev.

A. T. EGAN of Salt Lake City, Utah, is in Mexico City, Mexico.

J. E. BAMBERGER of Salt Lake City, Utah, is in De Lamar, Nev.

W. LAWRENCE has returned to Salt Lake City, Utah, from a trip East.

W. I. HUPP, of Folsom, Cal., is in San Francisco, Cal., on mining business.

W. O'NEAL of Wells, Nev., is in Salt Lake City, Utah, on mining business.

J. H. HENLEY is superintendent of the Valley L. & M. Co. at Leadville, Colo.

M. L. EFFINGER of Salt Lake City, Utah, has gone East on mining business.

W. ATWOOD, a mine owner of Mokelumne Hill, Cal., is in San Francisco, Cal.

G. A. LAND of Salt Lake City, Utah, is at Butler, Nev., examining mining interests.

E. M. DOUGLASS of Salt Lake City, Utah, is in Cincinnati, O., on mining business.

D. L. KILLEN, president Killen-Warner-Stewart Co. of Sumpter, Or., is in New York.

DANA HARMON has returned to San Francisco, Cal., from an inspection of mines.

B. HAUG is superintendent Dewey mine, near Roosevelt, in Thunder Mountain district, Idaho.

J. K. MCKENZIE, E. M., of Chicago, Ill., is in Shasta county, Cal., making mine examinations.

J. H. MCKENZIE, formerly manager of Le Roi mine, Rossland, B. C., is in San Francisco, Cal.

WOODSON GARRARD is in San Francisco, Cal., from his mines in Cochise county, Arizona.

T. J. MCWATTY, treasurer Minersville M. Co., has returned to Sumpter, Or., from Chicago, Ill.

J. M. WRIGHT, president of the Peerless Oil Co., is in Bakersfield, Cal., from San Francisco, Cal.

C. H. LAIDLAW of Fairview, N. M., owner Black Knife mines, is in the East on mining business.

J. V. N. DORR, has returned to Deadwood, S. D., from a visit to Chicago, Ill., on mining business.

J. A. MUDD, of the U. S. Geological Survey, is in San Francisco, Cal., from Washington, D. C.

J. S. PARKER, manager North Star mine, near Fort Steele, B. C., is vice-president Dundee M. Co.

J. W. TAYLOR of Salt Lake City, Utah, manager of the Ima mine, has returned from a short trip East.

R. CAMERON returned last week to Salt

charged will deliver a proportionately greater quantity of air to the reservoir on each reciprocation of said piston. This invention is designed for use particularly on locomotives, and its object is to afford a means of increasing the capacity of the compressor by which the reservoirs supplying the air brakes are charged.

HYDROCARBON BURNER.—No. 723,010. March 17, 1903. A. D. McLean and C. H. Picard, San Francisco, Cal. This invention consists of an oil burner with a conductor and head portion having a transverse segmentally raised section at its outer end and a slot or channel made transversely of said section, a plate having a corresponding curvature at its outer periphery, and plate fixed in the slot so as to separate the oil and steam passages, and forming a separate slot or passage up each side of it, an oil conducting passage through which the hydrocarbon is delivered to the slot in the plate, and one or more independent passages through which steam is directed to impinge against the sides of the plate, to divert the steam and heat the oil passage, and to be afterward discharged through the slots upon each side of the plate.

Latest Market Reports.

SAN FRANCISCO, March 27, 1903.

METALS.

SILVER.—Per oz., Troy: London, 22½d (standard ounce, 925 fine); New York, bar silver, 48½c, refined (1000 fine); San Francisco, 48½c; Mexican dollars, 38 @39c San Francisco, 38½c New York.

COPPER.—New York: Standard, \$13.75; Lake, 1 to 3 casks, \$14.50@15.00; Electrolytic, 1 to 3 casks, \$14.75@15.00; Casting, 1 to 3 casks, \$14.25 @ 15.00; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £63 15s spot per ton.

LEAD.—New York, \$4.67½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £13 5s per long ton = 2.75c per lb.

SPELTER.—New York, \$5.65; St. Louis, \$4.60; London, £22 15s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$29.80@30.10; San Francisco, ton lots, 32c; 500 lbs., 32½c; 200 lbs., 32½c; less, 33c; bar tin, 35c @37½c. London, £136 12s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 @ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$45.50@46.00; large lots; London, £8 15s; San Francisco, local, \$45.00 @ flask of 7½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 21c; San Francisco, Plumbers', 100-lb. lots, 17.65c.

NICKEL.—New York, 50@60c @ lb.; ton lots, 45@48c.

STRUCTURAL METALS.

IRON.—Pittsburg, Bessemer pig, \$22.10; gray forge, \$20.50; San Francisco, bar, 3c @ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

San Juan Mining Bureau,

BENSON BLOCK, SILVERTON, COLO.

For information regarding SAN JUAN Mining Properties, write.

We have a limited number of splendid propositions, partially developed producers, for sale—gold, silver, copper, lead.

Address RUSSELL FULLER, Mgr. Silverton, Colo.

SITUATIONS WANTED.

A PRACTICING PHYSICIAN AND SURGEON. in San Francisco, of excellent standing, desires a position as surgeon to a mine or mining company. Is a graduate of the University of California. Best of references given. Address Box 12, this office.

ASSAYER WITH OWN OUTFIT WILL GO anywhere. Best references. Box 14, this office.

ASSAYER WITH OUTFIT WISHES A POSITION as superintendent of a mine, millman, smelterman or tool sharpener; 14 years' practical experience. J. L. Wetmore, 404 12th St., Oakland.

ASSAYER, CHEMIST AND MILLMAN (concentrator and amalgamating), thoroughly up to date in each branch, desires position. Best of references furnished of a 20-years' experience. Address Box 125, care Mining and Scientific Press, 606 Mack Block, Denver, Colo.

COMPETENT BOOKKEEPER, TYPEWRITER and general office man desires position with mining or smelting company. Can furnish best of references. Address Box 25, Mining and Scientific Press office.

COMPETENT MILLMAN, MACHINIST AND Chemist. Experience free mill and concentrating. College education. Have built and operated mills in Montana for 12 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. References the best. Address H., care this office.

MILLMAN, PRACTICAL, WITH 20 YEARS' experience, wants a situation. Concentration, amalgamation, cyaniding and assaying. Best of references. Arizona or New Mexico preferred. Address "Millman," 1056 South Gaylord Street, Denver, Colorado.

WANTED, SITUATION AS ASSAYER—MINE, mill or smelter. Mexico preferred. At liberty May 1st. Am also an engineer and draughtsman. Can furnish best of references. Address E. C., this office.

WANTED, POSITION AS SUPERINTENDENT of mill. Have had six years' experience in cyaniding in all the details of the practice, including designing, building and operating plants. Wet crushing in cyanide solutions and slimes treatment a specialty. Can superintend mine if desired. Will go anywhere. Address "Milton," care of Mining and Scientific Press.

YOUNG MINING ENGINEER OF SOME PRACTICAL experience desires position as assistant. Good surveyor, assayer and draughtsman. Best of references as to character and ability. Will go anywhere. Address E. D. C., care of this office.

RAILROAD SURVEYS. Applications for positions of Transient and Topographers will be received by the undersigned up to April 1st. None but experienced men need apply. The Company furnishes its own instruments and equipment. Address Chief Engineer Oregon & Pacific R. R., Room 29, 2nd floor, Mills Building, San Francisco.

I will give one-half interest in two mining claims or one-half interest in ten claims for \$100 each, to do assessment work in this great camp.

Address JOHN HOWSAM, Tonopah, Nevada.

WANTED.

Wanted, to interest capital in a valuable placer claim suitable for DREDGING ONLY.
Address "Placer," care of this paper.

Wanted---A Superintendent

For foundry, forge, machine and holler shops employing 200 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answerers confidential. Address Z. P. O. box 153, Station C, Los Angeles, Cal.

CAPITAL REQUIRED.

The owner of a mining claim, situated in one of the leading districts of California, at present being developed, is desirous of disposing of a one-half interest, the amount received to be expended upon the property. This is a legitimate and promising enterprise. For further particulars address Box 21, this office.

WANTED TO BUY.

A Good Second-Hand Mill or Concentrator of 25 to 40 Stamps, Steam or Water Power.

Must be cheap and machinery in good working order and situated so it can be dismantled and loaded on cars without great expense. Address "Stamp Mill," care Mining and Scientific Press.

PICHER

Natural Blue Lead Paint.

Best protective paint for all iron and steel surfaces. Withstands the action of sulphuretted hydrogen gases. Send 25 cts. to cover express charges for one quart and illustrated booklet free.
Address Dept. B.

PICHER LEAD CO.

Chicago, Ill. Joplin, Mo. New York, N. Y.

Self-Vulcanizing Packing

Will pack any kind of joint. Is particularly adapted for packing expansion or heated joints, as it does not burn or char. It conforms readily to any unevenness in the surfaces between which it is placed, and therefore obviates the necessity of facing joints, thus reducing the cost of construction and repairs.

The Valuation of Mines.

Mine sampling, whether in the daily routine of working a mine, or where conducted for some specific purpose, such as placing a valuation on the property, requires, and should receive careful, methodical, painstaking attention. Reliable results cannot be obtained if the work is done carelessly, or in a haphazard fashion. The ore stands exposed in the mine. It is the business of the person sampling the exposed ore faces to take his samples in such a manner that they will represent as nearly as possible the vein at each place that a sample is taken. If such a sample is not obtainable in small quantity it should be taken in large amount. Any sample that does not represent the vein, or portion of the vein from which it was taken, is valueless. A great deal has lately been written about mine sampling and mine valuation, and some very good ideas have been advanced on the subject by various writers. The work should be done honestly and as thoroughly as possible, and the more completely the task is done the greater value the result will have.

That a scientifically educated mining engineer is the only person competent to sample mines is a mistaken idea, for there are many practical miners who have not had the advantages of technical education who can do this class of work as well as any one else, having been trained in that particular branch.

Preliminary samples to determine where the good and poor places are located in a mine are unnecessary, and are likely to bias the judgment of the person taking the samples. Nothing short of absolute systematization, methodical work will accomplish the desired result. If there are poor places the sample map will indicate where they are, and in like manner the rich spots will give an account of themselves.

The sample map should consist of a drawing showing all the workings in the mine, and on it should be marked the point at which each sample was taken. This should be indicated by a running number. The width of the vein sampled at each place should also be marked on the map. The values, as subsequently determined, may be placed on the map, or they may be entered in a book provided for the purpose, together with its proper number. The more simple the report the more will it be appreciated by those for whom it is intended. It is a good idea to place the values on the sample map, as the relations which the several samples bear to each other then

become more apparent and valuable conclusions may be deduced therefrom.

The sampling of a mine is a task which is purely mechanical, requiring only practical ability to properly take the samples, with the exercise of common sense in the selection of the system or method pursued in the work.

Assaying the samples and making qualitative and quantitative analyses, amalgamation, chloridizing or cyanide tests, belongs to a separate branch of the business, though the man who takes the sample may be thoroughly competent to perform this work as well. Placing the gross valuation on the mine by the results obtained from the samples cannot be safely attempted by an inspection of the sample map alone, except in so far as it concerns "ore in sight"—that is, ore exposed at reasonable distances, on four sides. The possible ore is a factor which should not be given too great consideration unless the sample map be accompanied by a complete report, made by an engineer who is known to be competent to make it. Fixing a probable valuation on the future possibilities of the mine is a delicate and responsible task, which should be submitted only to one known to have had a sufficiently varied experience to render his judgment valuable, if not infallible, for the latter he can never hope to become. A thorough acquaintance with mineral veins and deposits generally, and particularly of veins or deposits similar to the one under consideration, is indispensable to this branch of the business of mine examination, and when it is considered that no two mines are exactly alike, only similar at best, the responsibility attaching to this estimate of value should be appreciated.

Having arrived at the absolute and probable gross

El Paso Shaft, Cripple Creek, Colo.

value, the next thing to determine is the net value. The cost of operating the mine, which includes further development and equipment, and the actual extraction of ore, timbering, reducing the ore and obtaining the hullion, are matters which can only be determined by an experienced mine operator. It may be possible to find in a single person one competent to undertake and successfully carry out each of the several branches of mine examination as above indicated, but it usually requires the experience and mature judgment of several persons, who make a specialty of each branch. Graphic diagrams employed in making mining reports should be of the simplest form. Complex diagrams, which may be perfectly intelligible to the engineer, are not always equally so to the non-technical reader.

The El Paso Mine.

In the Cripple Creek, Colo., district there are now 134 producing shafts within an area of 6 miles square, a condition not at present duplicated in any other district in the world. Among these the El Paso shaft is at present attracting more attention than usual, because the drainage tunnel now being driven to make deeper working feasible and less expensive is being partly accomplished by means of headings driven from this shaft. The accompanying illustration shows the head frame of modern design, having two dumping stations. It also gives a general idea of the other extensive surface improvements. The El Paso is one of the most important mines in the Cripple Creek district, and is one of the few mines actively working at present, owing to labor troubles arising over the strike of millmen at Colorado City.

The El Paso has a new three-compartment shaft which is down 600 feet. It is stated that it cost \$45 per foot. The ore bins have a capacity of 2000 tons, and ore washing machinery for automatically cleaning the clayey ores as they come from the mine has been provided. The air compressor will operate twenty-four drills. The output of the El Paso mine the past year has been about \$40,000 per month. It is expected that the completion of the drainage tunnel will effect a saving to this property alone approximating \$25,000. The tunnel will run for about 700 feet through El Paso ground, serving thereby a double purpose. S. S. Bernard is general manager. The original holding of this company was comparatively small, but by several acquisitions the property now embraces seventy-four acres, the latest purchase being that of the North Star property.

Life of the Anthracite Mines.

Director Charles D. Walcott of the United States Geological Survey has estimated that the anthracite coal mines will continue to produce sufficient coal to supply the demand for the next 200 years before they are practically exhausted. The estimated aggregate tonnage in these beds, including that already removed, is placed at 19,507,872,325 tons, of which during the past eighty-three years 1,225,581,269 tons have been mined. The production of 1901, when conditions were practically undisturbed, was 57,367,915 tons. At this rate of extraction, the mines would continue to produce for about three centuries longer. The increase in extraction from 1890 to 1900 was about 22%. The anthracite coal averages a larger tonnage per square mile than the bituminous mines, owing to the greater average thickness of the veins of the former.

Profits in Copper Mining.

Reports of the several mining companies producing copper in the Lake Superior region show that, during the year 1902, they were operating on a very narrow margin, the price of the metal at about 11 to 12 cents affording relatively small profit; but with the increase in price to the present figures—14.75 to 15 cents—handsome profits are assured to most of the companies operating there. The reports indicate that some of the companies cannot work at a profit with copper below 12 cents, while others can produce copper profitably at a still lower price. The history of copper mining in that region is interesting, in consideration of the constantly improving methods and the larger scale of operations, together with the wide and sometimes rapid fluctuation in the price of copper.

Arbitration in Labor Troubles.

Strenuous efforts are being made in various directions, by committees appointed for the purpose, to bring to a conclusion and mutually satisfactory settlement the disagreements between employers and employed. For nearly two months the miners of the Crow's Nest Pass region in eastern British Columbia have been on strike for increased pay and recognition of the union—the Western Federation of Miners. Recently an organization, known as the Provincial Mining Association of British Columbia, was formed to promote and foster the mining industry of that province. The organization is composed of men representing almost every class and industry, including mine owners, and operators and mine workers, and as it is one of the aims of the association to adjust, if possible, differences arising between mine operators and their employes, a conciliation committee was appointed by the association to inquire into the cause of the trouble and to arbitrate and, if possible, adjust the matter. As all interests concerned were represented, much was hoped for from their efforts in this matter. After more than two weeks of effort in this direction it was thought that an agreement had been reached that would end the strike which has seriously retarded the metal mining industry of the province, but the verbal agreements were not signed, and as a result orders are being issued to several of the largest mines in the province to clean up and shut down indefinitely, as the smelters cannot operate without coal and coke. The conciliation committee is still at the coal mines, however, endeavoring to bring about an amicable settlement.

In Colorado the strike of the mill men at Colorado City is still in force and the mining industry of the Cripple Creek district is practically paralyzed. The strikers are members of the Western Federation of Miners, which organization ordered a strike February 14 last, alleging discrimination against members of their organization by the mill owners. An advisory committee was appointed by Governor Peabody, March 20, and the gentlemen have since been working faithfully to bring about a settlement, and at one time it looked as though they had succeeded. Manager MacNeill of the American Smelting & Refining Co. agreed to reinstate the strikers, with the exception of a few men, who had become personally obnoxious to him, and these he refused to reinstate under any consideration. It was agreed to accept this condition, the men who were excepted by Mr. MacNeill to be given employment at Victor, but when it was learned that the men to whom Mr. MacNeill had personal objection included several of the most prominent members of the union, the miners refused to sign the agreement, and the strike is still on. In this case, also, the arbitration committee will continue their endeavors.

In California the strike at Keswick continues, the only new feature being that locally it is stated that the Amalgamated Copper Co. is responsible for the continuation of the strike, but this seems improbable. When the miners returned to work after the first strike they claimed a complete victory, but as a matter of fact had gained nothing, and it was thought at that time that the trouble would shortly be renewed. Arbitration has also been attempted in this matter by merchants of Redding and Keswick, but without avail.

Arbitration committees usually accomplish much good, and, although in the instances above cited they have thus far failed to bring about a satisfactory adjustment of the several difficulties, it is not improbable that they may yet solve the problem by securing concessions from both sides to the controversy.

War Tax in the Transvaal.

The mining profits tax is a theme of moment in South Africa at present. This tax is levied in the settlement of the debt incurred during the recent war in the Transvaal. The tax will allow the expense of shaft-sinking and equipment to be considered as capital outlay to be deducted from "profits," but development is counted as working expense. In regard to capital for further development, this will also be treated as working expense. Shaft sinking to the banket is considered capital outlay and not as development. The life of the mine will

be computed on the tonnage of available ore reserves and the capacity of the mills as they now exist. The deduction for cancelling the debt imposed upon each mine by the Government is to be calculated for the life of the mine, and is proportioned to each working year. When the profit for a year's operation falls below the yearly allowance for amortization, both sums will be carried forward.

While the heavy tax imposed by the dynamite monopoly was one of the main actuating causes of the Boer war, the war tax resulting from it is scarcely less onerous, but cannot be evaded, and was a natural outcome of the war and was anticipated.

The Life of a Mine.

Mines of large size and famous record are popular and it is often said of them, "they are inexhaustible." As a matter of fact no mine is inexhaustible, though some possess reserves which insure a long period of successful existence. Most mines are made up of more than one shoot or ore deposit, and these usually differ to a greater or less extent in size and value, and sometimes in character. A mine which makes a record as a producer of high-grade ore is looked to by the public to continue this record, but there are few mines that do not sooner or later depreciate their output, or at least if maintaining it have to treat a vastly larger quantity of ore.

The Mount Morgan mine in Queensland, Australia, at one time a large producer, still makes a large output, but the ore no longer runs an average of \$70 per ton, nor is it quarried from a hillside as formerly, but it is mined from levels far below the surface, as in most other mines.

The mines of Bingham Canyon, Utah, were famous producers in their early history, but the rich, superficial ores, were largely worked out, and a period of idleness came. To-day they are again large producers, but the ores which afford a profit now could only have been worked at a loss in earlier days. Changes in cost of supplies and price of labor, improvement in and cheapening of transportation, and a greater economy in reduction of the ores, together with higher saving of values, have made this possible.

The history of the Comstock Lode of Virginia City, Nev., is familiar to all mining men. The annual output from the Comstock is still large, but it is mostly derived from low-grade ores; but close economy and high extraction of values only make this possible.

There are few large low-grade mines where the value of the ore does not change greatly; but the increased cost of mining from constantly greater depth is only offset by commercial changes for the better, greater economy in all branches and the absence of extravagance. Among mines of this class are the Homestake of South Dakota, the Alaska-Treadwell of Alaska, the large copper mines of Butte, Mont., and some of those of Arizona.

Another important factor in the economy of mining is the merging under one general management of a large number of mines, or mining locations, by which means a great saving can be effected. In the early history of the Comstock there were about forty separate companies, each with its separate manager, superintendent, and heads of various departments and large clerical force, with expensive offices in San Francisco, Cal. The saving which might have been made by the consolidation of several adjoining interests would have represented a large dividend to stockholders, but those were not days of economy. Should another Comstock lode be discovered it is improbable that similar scenes would be enacted, while it is very likely that large interests would be consolidated for economy in working and in management. The life of a mine is determined only when it is completely worked out, as ore left to-day because it is too low grade to pay may in a few years come within the range of "payable ore in sight."

TIN MINING has been carried on in Cornwall, England, for many years, and the natural inference would be that no undiscovered vein would be likely to exist in a district so thoroughly worked as that; but a discovery of good tin ore was recently made in a granite quarry near Kit hill. As the workings thus far are superficial, good profit results from mining operations at the new discovery, over \$15,000 worth of tin having already been produced.

CONCENTRATES.

THE usual method of measuring the economical working of a steam engine is its steam consumption per horse power per hour. When two engines are thus compared they should be operated at the same pressure.

SILLS are advisable under the posts of tunnel sets when the floor of the level is too soft to sustain the posts in position, unless the ground swells, in which event cross sills will prove of more trouble than service.

A 4-FOOT impact wheel, under 200 feet head, with 175 miles' inches of water, will develop about 84 H. P., if the standard nozzle for such conditions be employed. A smaller or larger nozzle will not give the same result.

ORE SHOTS do not always extend upward to the surface, nor, having been found in depth, are they always found to extend to indefinite depth; but they have limitations in all directions—depth, height, width and length.

THE American Smelting & Refining Co. was incorporated at Trenton, N. J., April 4, 1899; capital, \$65,000,000. The incorporators were W. E. Dwight, T. M. Day, Jr., J. J. Tracy, H. W. Thomas, A. P. Bartlett—all of Jersey City, N. J.

In estimating the amount of paint needed for a given surface, divide the number of square feet by 200. The result will be the number of liquid gallons required. Salt-peter solution washed over greasy spots will permit the paint taking hold.

ELECTROLYTIC ACTION does not take place because the electric circuit is a good conductor or a bad conductor, but because it is a mixed conductor. The current must pass from the metal into an electrolyte before electrolysis will take place.

THE color of the croppings of the Homestake mine at Lead, S. D., is that of anhydrous iron oxide—red. In depth the ore is white quartz with green hornblende schist of silky luster. The ore bodies are accompanied by intrusions of dike rock felsite.

SULPHURETTED HYDROGEN is sometimes employed as a precipitant of gold from its solutions. It has been used for this purpose in the bromine process. It is usually generated by the action of dilute hydrochloric or sulphuric acid upon iron sulphide.

WHEN a prospector locates a mining claim he should also at once investigate the water supply, as a means of power, or, if that be unobtainable, he should, at least, endeavor to secure sufficient water for reduction works by locating an unappropriated water right.

THE ability of the machine is beginning to outrank the ability of the man, and in the test it is the man that is beginning to fail. The locomotive to go 100 miles an hour is less difficult to build than it is to get the locomotive engineer who can drive it and retain his nerve control.

TAPPETS that are screwed onto the stamp stem are in use in some Australian and New Zealand mills, but as far as known at no place in America, where tappets are secured by means of gibs and keys. The American style of securing tappets is displacing the screw type in those colonies.

TELLURIDE GOLD ORES are often found to be free-milling at and near the surface, though this is not universally the case. Ores containing tellurides of gold may be made free-milling by roasting; but there is often considerable loss of value when this is attempted on a commercial scale.

TEN CENTS per kilowatt hour would be a cheap charge for electric current. A 16-candle power lamp at 110 volts would take half an ampere, using 55 watts per hour. Thus ten lamps in ten hours would use 5500 watts or 5.5 kilowatt hours, which at 10 cents per kilowatt hour would be 55 cents.

POWDER STAINS may be removed from the face by the use of hydrogen dioxide. The face should first be washed thoroughly and then covered with pieces of lint saturated with glycerine one part and hydrogen dioxide three parts. In two or three days the particles and stains of powder will have disappeared.

THE total pressure of quiet water in a dam, tank, or other surface, can be found by multiplying together the area in square feet of the surface sustaining the pressure, the vertical depth in feet of its center of gravity below the surface of the water, and the constant 62.5. The product will give the pressure in pounds.

THERE are three great copper producing districts in the United States, and each district mines a different character of copper ore. The copper produced in the Lake Superior district is almost wholly from ores containing native copper. The copper produced in and

about Butte, Mont., is mostly from sulphide ores, such as chalcocite and chalcopyrite. The Arizona copper is mainly produced from the carbonate azurite and malachite, while a small percentage is from the oxide cuprite.

SILVER usually accompanies gold in veins, though often in very small amount. The fineness of vein gold is usually about 800 to 900. Almost invariably placer gold has a higher fineness than that of the veins from which it came. The gold of the Juarez placers in Lower California, Mexico, is reported to be worth \$20 per ounce.

IN the case of beams supporting loads, with equal lengths, the diameters vary as the cube roots of the loads; or, the cubes of the diameters vary as the loads. If a beam 11 inches in diameter supports a load of 32,160 pounds, a beam of the same material and same length, 9 inches in diameter, will support a load of 19,446 pounds.

A TON OF ORE containing iron-copper sulphide and 30% silica and other earthy minerals carries about 630 to 650 pounds of sulphur, the greater part of which, upon treatment in a smelter or by roasting, escapes into the air, uniting with oxygen to form sulphurous oxide (SO₂). This varies according to the proportion of pyrite to chalcopyrite in the ore.

THE cheapening of aluminum is due to the introduction of the electric furnace in its manufacture. Aluminum is one of the most abundant of elements, but there are only a few minerals from which it can be profitably extracted as yet; the principal ones are cryolite (an aluminum, sodium fluoride) and bauxite, an aluminous oxide, sometimes called aluminum ore.

IN making experiments on or for anything in the way of a mining and metallurgical process or appliance it is essential that for any practical resultant good all the conditions and requirements of the larger plan in view should be included. One cause of failure in "laboratory processes" is the omission of the things that would enter into the question when on a commercial basis.

THE zinc mineral hydrozincite, sometimes called marionite, is a hydrocarbonate of zinc of little importance because of its rarity. It is wholly found as an incrustation on smithsonite or sphalerite, never crystallized; hardness 22.5, gravity 3.5. Spain produces some, and as marionite in fibrous white crust on smithsonite ores of Marion county, Ark., with sphalerite at Joplin, Mo., with smithsonite at Magdalena, N. M., and Durango, Mexico.

IRON TAMPING BARS are considered almost as dangerous in tamping nitro powder as black powder. It is not necessary to secure good results that a blast should be tamped down with a hammer, even when a wooden tamping stick is used. Even loose tamping seldom blows out of a hole charged with nitro powder. In wet holes the paper containing the nitro compound should be tightly tied about the fuse and axle grease well rubbed on to prevent water reaching the cap.

WATER flowing in a wooden flume may safely have a velocity of 7 or 8 feet per second; but in an earth ditch it should not exceed 3 feet per second. A good grade for a flume is about 2 inches in 100 feet. The velocity of water in a flume 3 feet wide, carrying a stream 18 inches in depth, with $\frac{1}{4}$ -inch grade to the rod, is 2.6 feet per second. With $\frac{1}{4}$ -inch grade the velocity will be 3.7 feet per second, and with $\frac{1}{2}$ -inch grade per rod the velocity would be 5.3 feet per second. In the latter case the flow would be 1431 cubic feet per second.

LEUCITE ROCKS were for many years supposed to occur only in certain localities in Europe. In 1874 Vogel-sang discovered an Asiatic leucite in basaltic rock on the island of Baucau, north of Java. The petrographic investigation of rocks of the fortieth parallel in the United States by F. Zirkel resulted in the discovery of rocks rich in leucite in Wyoming. More recently rocks containing leucite were found abundantly in the Black Hills, South Dakota, and in Cripple Creek district of Colorado in phonolites and allied rocks. Leucite is usually associated with nepheline.

THE proper treatment of an ore containing precious metals can only be determined by actual experiment. The variations of stamp milling practice are so wide, though all along the same line, that it is impossible to say which method will best work any particular ore without trial. Concentration is one of the most important features of milling gold ores, and this until very recent years received less attention than it deserved. In the light of metallurgical knowledge of the day there is little ore that cannot be satisfactorily treated by some one of the various processes.

SHAFT SINKING may usually be accomplished with a bucket better than with a skip, as the former can be easily moved about at the bottom of the shaft, thus facilitating loading. In deep shafts the tendency to swing is overcome to great extent by use of a crosshead running on guides in the shaft. Where there are three compartments in a shaft arrangements should be made to run the bucket or skip in the central compartment. In inclined shafts the skip is generally preferred, as extension tracks may be placed to allow the skip to reach the bottom of the excavation. No figures of cost in

shaft sinking are of value unless all the conditions under which the work was accomplished are known, as the cost varies greatly in different shafts, even in the same district. A shaft sunk in soft ground can be carried down much faster, and therefore less expensively than one in hard rock, but the soft rock shaft often proves in the end to be the most expensive, owing to the cost of maintenance.

ZINC is mined in several localities in the United States, the ores of Missouri, Kansas and Colorado being the sulphide sphalerite. In Arkansas there is mined carbonate of zinc and smithsonite, and in Virginia carbonates and the silicate calamine. The only known locality in the United States producing zinc oxide is at Franklin Furnace, N. J., where the minerals zincite and franklinite are mined. The peculiar yellow carbonate of zinc, sometimes called "turkey fat," from the fact of its resemblance to the fat of a turkey, is only found in the United States, in Marion county, Ark., and in small quantity.

THE amount of iron ore estimated to be in sight in the Mesabi iron range, in Minnesota, is 500,000,000 to 700,000,000 tons—this is ore containing over 58% metallic iron. The amount of ore containing under 58% metallic iron is known to be very large, but no estimate of the quantity has been made, owing to insufficient data. At some of the mines where it can be done inexpensively, where the lower grade ore has to be moved to get that of better quality, the low grade is being piled for future use. Other iron ranges of the Lake Superior region were estimated in 1902 to have a reserve of 350,000,000 tons of ore.

NOT all sandstones are suitable for building purposes or foundations. The life of a rock varies with its ability to resist weathering, and uniformity of texture is necessary to a first-class stone. A small amount of clay in fine-grained sandstone will not lower its strength, but if coarse-grained and porous it will absorb water and cause the rock to swell and crumble. Iron sulphide is undesirable also in building stone, as it has a tendency upon oxidation to cause the stone to disintegrate. Sandstones should always be laid with their bedding normal to the pressure, or the stone, unless very strong, will split or crumble under direct pressure.

NOTHING in the reading columns of this paper is paid for in any way by anyone. Anything deemed of sufficient public interest to the readers is published. The editors are the judges of that. The paper will not publish an advertisement "pure and simple" in form identical with the regular body of reading matter. This is because the management of the paper is unwilling to have anything which is paid for as an advertisement go before the readers in a form which would lead them to believe it to be editorial matter, and, therefore, not paid for. It is merely a question of integrity and good faith as between the management of the journal and its readers.

COBALT is produced at the Mine La Motte, Missouri, in connection with nickel. The matte containing the nickel and cobalt is refined in New York and at Camden, N. J. It contains about 13% nickel and about 8% cobalt. About 50,000 pounds of cobalt oxide is annually imported into the United States. The principal sources of supply are the cobaltiferous ores occurring with nickel ores. The average percentage is low, often less than 1%. Ores and mattes containing small percentages of cobalt will be received by metallurgical establishments. Cobalt oxide is worth about 18 cents per pound. Fuhrman's Manual of Assaying gives complete tests for cobalt and nickel ores.

IN laying a sewer pipe there should always be a grade which will give a self-cleaning velocity. This will depend upon the character of the sewage. For 15-inch sewer, if 2 feet a second is assumed as the self-cleaning velocity, the minimum gradient would be 0.133 or 1.6 inches per 100 feet. By Kutter's formula the velocity of flow in a sewer on this gradient would be slightly over $\frac{1}{4}$ feet per second. These velocities are computed for sewer running full or half full. If the usual flow of sewage is very small, and flushing flows are infrequent, the gradient should be increased as the volume of constant flow is reduced. Many sewers have been laid on less gradients than the minima here stated, but always with the expectation of later expense for cleaning.

IN recent years the business of gathering and selling mineral specimens has grown. There are now about thirty mineral specimen dealers in the United States, the dealers in New York, Philadelphia, Rochester and Washington, D. C., being especially active in their hunt for specimens. New minerals and new localities are eagerly sought for by them, and it is not an unusual matter to expend thousands of dollars to secure some valuable find. These concerns have their men out all over the world looking up specimens. Two companies in the business have a paid up capital of \$50,000. There are estimated to be a hundred thousand people in the United States that might be called mineral collectors. The colleges and museums are the largest buyers of specimens. The cities of New York, Chicago and Washington have fine mineral collections, New York in its American Museum of Natural History, Washington in its National Museum, and Chicago in its Field Museum. Many of the larger cities have not even made a start on a collection, but as an educational feature each city of any importance will eventually establish a collection.

The Elimination of Arsenic, Antimony, Lead and Zinc From Copper Mattes.

Written for the MINING AND SCIENTIFIC PRESS by
S. E. BRETHEBERTON.

I propose to show that the above metals are not so objectionable as generally supposed, if smelted in an ordinary blast furnace with hot blast and making a normal slag, such as one would aim to make under ordinary conditions with cold blast. We obtain all our Fe from iron sulphides.

In order to avoid controversy and save time, as I am too busy to do the subject the justice it deserves, I shall only give a brief description of our smelting practice as followed at the Val Verde Copper Co.'s works at Val Verde, Ariz., during the past twelve months, which practice shows conclusively that it is not necessary to do any preliminary roasting when smelting copper ores containing S and As, or dread those objectionable elements as we have in the past, as they are sufficiently eliminated in blast furnace smelting.

We not only have S and As to contend with, but also Pb and Zn, and some Sb, all of which we have eliminated from the matte so as to produce a marketable product, free from As and Sb, and below the limit for Zn and Pb as penalized by the refineries. The copper has to be not less than 45%, while the charges smelted last winter and spring averaged about as follows: 1200-pound charges (all ore from different mines), one of which contained the necessary CaO and also MgO, with some Cu, so that it was classed as ore. The mixture averaged:

Wet Cu.....	2.5
Fe.....	23.0
MgO and CaO.....	8.5
S.....	21.5
As.....	7.1
SiO ₂	21.6
Al ₂ O ₃	3.7
Zn.....	4.5
Total.....	92.4

The balance of the 100% was Co₂, O, Ph, etc. In addition to the 1200 pounds, 300 pounds of coarse slag was used on account of the fine ore (sulphide), making a total charge of 1500 pounds, with which we used 60 pounds of coke, containing 25% ash, and blast heated from 400° to 450° F. We reduced the coke to 45 to 55 pounds to the charge and raised the temperature of the blast to 550° to 600°, but, after several weeks' running, finally decided that we required as much coke for the regular working of the furnace with 600° temperature as we did with only 400°. Our first matte product was rich in Au and averaged 23% to 30% Cu, no As or Sb, with a trace of Pb and Zn. This matte was resmelted once with siliceous copper ores, sometimes partly oxidized, to produce the 45% to 50% Cu matte for shipping. The siliceous ores are, and were then, any class obtainable on the market, assaying from less than 1% to 10% Cu.

Since last spring the situation has changed, until now we have less As, but more S, Pb and Zn. The Pb we do not attempt to save under 10%, as it is cheaper to burn it off in the copper matting furnace than to roast it and then smelt it in the lead furnace with a high percentage of expensive coke, even if we could save all the Pb. Coke here is more expensive than in Leadville, Colo., where I was in charge of lead smelters for eleven years, and where for weeks at a time my charges did not average much more in Pb than the following mixture; but at that time it was a question of saving the Pb, which we did quite satisfactorily, whereas now we are compelled to get rid of it, mostly by volatilization. Ores and concentrates containing more than 10% Pb we smelt in the lead furnace.

Our present smelting mixture here is, and has been for the past three months, as follows:

320 pounds sulphide ore,
60 to 100 pounds lime rock,
860 to 840 pounds bricked sulphide concentrates,
400 pounds coarse slag.

1,640 pounds,

with which we use 50 pounds of coke containing 18% to 19% ash. At times we drop the coke to 40 and 45 pounds.

The 1240 pounds of ore and flux averages 7% Pb, 7.1% Zn, 2.1% wet copper, 23.2% S and 1.3% As. The matte in this case is again free from As, but contains only 13% to 15% Cu. The Pb and Zn are also over the 3% limit, but is eliminated to below that percentage when rerun for shipping. I attribute the poorer concentration now not so much to the slight excess of S over the first charge as to the shortage of silica and the Pb and Zn contents, which metals are so difficult to desulphurize in ordinary roasters.

Last summer when I had mixtures on containing more S but very little Pb and less Zn, the concentration was between 7 and 8 to 1, about the mean between what it is now and what it was last spring. Another reason, no doubt, is on account of the bricks

now being frozen and containing so much H₂O. This keeps the top of the furnace cooler than we want it, although the crucible keeps hotter. The slag has always been very clean, showing a little more than a trace in Au, Ag and Cu, and our metallurgical showing excellent.

The wood consumed for heating 3700 cubic feet of air per minute to 400° amounts to one and one-half to two cords in twenty-four hours.

The smoke, when the furnace is making the best concentration, is a beautiful sight to watch on a clear day, changing from a gray white, just before the feeder puts in a charge, to a dark red, greenish yellow and (when we had so much As) orange yellow, showing the different stages of oxidation as the fumes pass off with sulphide of arsenic when the furnace top is coolest.

This system of smelting requires much more care on the feeder's part than when using plenty of fuel with roasted and oxidized ores. For with us depending on the iron in the sulphides entirely for fluxing purposes, outside of the 9% to 10% lime, excess fuel prevents concentration, causing an increased matte flow carrying the iron intended for the slag into the matte. This often causes trouble, due to the slag becoming too acid and an accumulation of zinc, arsenic and lead forming in the crucible, gummy in nature and similar in composition and appearance to the sows found in lead smelting crucibles.

Should the furnace get cold and require extra fuel, it is better to feed a charge or two of slag, or harrings—should there be any on hand, and increase the coke to 9% or 10%; as the barrings being partly desulphurized and the slag containing but little over a trace in sulphur, the extra fuel is not a detriment, and of course this charge is also coarser than the usual ore charge, which starts the furnace to running faster, so that the expense of feeding two or three of these charges of half slag or half ore (with a little extra coke) on each shift is more than offset by the faster running of the furnace.

It is self evident that smelting such refractory ores as we have here with cold blast would be out of the question, not only on account of the extra expense for roasting and extra coke in the blast furnace, but the fact that arsenic and lead would be reduced into the matte so as to make it unmarketable.

One smelting plant, not far from here, several years ago made a matte containing 16% arsenic and a lot of regular speiss.

I understand that another smelter in this vicinity, with cold blast and the usual amount of coke, eliminated the arsenic very successfully by running with a siliceous slag and a hot top furnace, but the smelting campaign was too short to prove that it would be a continued success.

My experience with cold blast and using the necessary coke, say 10% at least on the burden, and getting a hot top, due to the siliceous slag, meant a good concentration, but only a few shifts could be run before freezing up, unless the furnace was repeatedly physicked with extra fluxes and coke, which neutralized the benefit gained by the hot top and the furnace would smelt very slowly; even then we were not able to prevent freezing up often.

We do not find it very expensive and it is a simple arrangement we have here for heating the blast, designed by the writer, and patented, on the same principle as a tubular boiler, the heat passing through several hundred flues, which strengthen and hold the box together, the blast passing back and forth through the inside of the box en route to the furnace from the blower. The flue ends are protected over the firebox with copper thimbles inserted and expanded on the inside and well headed on the outside over the heading of the flues. The steel plates (copper would no doubt be better) do not huckle, except directly over the firebox, and very little there, due to its being so thoroughly perforated by the flues, which act as heat distributors.

At this writing we are running with only forty pounds of coke on a 1600-pound burden, after several weeks' run with only fifty pounds of coke to the charge; tuyeres all open nicely, matte 2% higher in Cu than with fifty pounds of coke. The furnace has been running very free for a week or more, but the SiO₂ is too low in the slag and the Fe too high for clean work; that is, the Au and Ag since reducing the coke, and driving more Fe into the slag, the CaO is down to only 7% in the slag, SiO₂ 33%, making the specific gravity of the slag too high. Both my feeders and furnace men now want me to try running without any coke, but I am willing to leave well enough alone.

We expect to use moderately heated blast with our lead furnace in a few days.

ONE of the most satisfactory methods of obtaining daily samples in headings, of any description, in mines is by testing the drillings, particularly those which cross the strike of the vein. Drill holes running parallel to the walls may follow rich or poor seams, and consequently convey a false impression of the average value of the ore.

THE mineral wealth of the districts about Cottonwood and Bingham canyons, Utah, was discovered by Government troops located in that vicinity, and were the first discoveries made in Utah.

Cambrian Ore Deposits in the Black Hills.

Written for the MINING AND SCIENTIFIC PRESS.

The existence of gold in the Black Hills of South Dakota was known to the Sioux Indians, whose reservation embraced those mountains, but the first authentic account of its discovery was made known by a half breed in 1874 at Fort Laramie, Wyo. He had a few grains of gold in quills which he claimed to have obtained in the bed of a stream in the foothills of the Black Hills. Although still an Indian reservation, a stampede occurred in 1875, but the reservation was not opened to settlement until 1876.

There was a large influx of prospectors and adventurers in 1876, when most of the best placer deposits were discovered and to a great extent worked out, though placer mining continued to thrive for several years. In 1876 the Homestake mines and many others were discovered. The value of the ore deposits in the Cambrian was also early recognized in several localities, the most important being those near Bald mountain, on Green mountain, and near Terry's peak, about 7 to 10 miles south of Deadwood, and those on Bear Butte creek, at Galena.

The geology of the Black Hills is simple, except where intrusions of igneous rock and extensive faulting have locally disturbed the strata. The basement rocks are micaceous and garnetiferous schists and slates, quartzites, amphibolite schists and other crystalline rocks of Archæan time, with ancient intrusive dikes. This terrane was an island in the Cambrian sea. The degradation of the Archæan hills resulted in the formation of heds of shingle along the ancient shore line, extending entirely around the Hills, which subsequently became cemented into a firm conglomerate. The cementing material was either silica, iron oxide, carbonate of lime or clay, or a mixture of these minerals. The conglomerates vary from a few scattered pebbles to heds over 40 feet in thickness, as on Castle creek, near its confluence with the south fork. The entire region was one of subsidence in Archæan time, and heds of sand 10 to 40 feet thick were deposited upon the shingle. Following this were alternating deposits of calcareous and argillaceous material intercalated with heds of red sand. These latter formations contain large amounts of the iron silicate called glauconite (green sand). At the top of the Cambrian was another heavy deposit of fine sand, which, as well as that at the base of the formation, later became consolidated into a dense, firm quartzite. Following the Cambrian were successive deposits of limestone, sandstone, etc., to the close of the Cretaceous, when the entire Black Hills section was uplifted. This movement was accompanied or caused by the intrusion of igneous rocks, chiefly rhyolite, trachyte and phonolite, forming many laccoliths, in the northern Hills. The sedimentary series extended like a great flat dome entirely across the uplift, the central portion being later eroded, exposing the underlying Archæan rocks, and the edges of the sedimentary series surrounding them.

In these latter the ore deposits are extensive and valuable, particularly in the Cambrian, though ores (chiefly lead-silver) are found in the Carboniferous limestones. The most noted of the latter are at Galena and at Carbonate. The ore deposits in Cambrian quartzite contain a greater value in gold than in silver and carry, except in a few isolated places, relatively little lead. As already stated, the conglomerates at the base of the Cambrian contain "placer" gold, derived from the underlying gold-bearing Archæan schists. Gold is known to occur in these conglomerates near Central City, at Rockerville and near Bear gulch. On the south fork of Castle creek the Cambrian conglomerate contains native copper in disseminated grains. The bedrock at this place is black slate containing copper, indicating that the metal was derived from the older rocks.

The lower quartzites immediately overlying the conglomerates, or lying upon the upturned edges of the schists in the absence of the conglomerates, and the indurated shaly beds resting upon the quartzites, and also the upper quartzites, which occur from 200 to 250 feet above the basal members, are the most important horizons of ore occurrence in the Cambrian.

In these strata occur a large portion of the gold-telluride ores which have been extensively developed within the past fifteen years. No metallurgical problem was more vexing than the successful treatment of these ores from their discovery in 1876-77 to 1887. Each new undertaking prior to the latter date added only one more failure to those which had previously been made, but the introduction of the harrel-chlorination and cyanide processes has made a high extraction of values from these ores possible at relatively low cost.

The Cambrian heds are fractured and intruded by sheets of eruptive rocks injected from some neighboring vent, forming numerous extensive laccoliths. Subsequently both sedimentary heds and sheets of eruptive rock were cut by intrusive dikes, and it is in more or less direct association with the latter that the ore deposits of the Cambrian were formed. These ore shoots exist as impregnations in the

quartzites and shales, containing a large amount of silica and conforming to the enclosing beds, varying in dip with them, but as most of the intrusive dikes have a northwest-southeast strike the ore shoots follow approximately the same strike, regardless of the dip, being anomalous in this respect. Not only is this true of single ore shoots but also of whole systems of such shoots, a series of ore bodies being found to extend in a northwesterly direction for several miles, where erosion has not entirely removed the deposits. And in this connection it may be mentioned that erosion has removed ore which in place would be worth many millions of dollars, but unlike most gold deposits the erosion of these telluride ore deposits did not form rich placers owing to the fine state of division of the gold in the ores.

The erosion has been of such a character that the hard quartzite is often found extending over considerable areas, everything above it having been removed. This is particularly true of the lower quartzite, which in places cover several square miles of territory. This fact often makes the ore bodies easily accessible, particularly in the neighborhood of Terry's peak and Green mountain, but westerly from there about Ragged Top the quartzites are covered by several hundred feet of limestone and sandstones, and it is only along the canyons that the quartzites are accessible.

In many places erosion has left extensive and valuable ore deposits lying practically upon the surface where they may be quarried out at minimum expense. (See illustration of the Lucy mine on front page.) Most miners prefer a vein pitching into the earth at a high angle and extending to unknown depth, but in some of these Cambrian deposits are found the ideal mine. Its limitations are easily and quickly determinable. The ore is practically all "in sight," sometimes a few feet of stripping is necessary, but on the whole, as the values are relatively high, an ore deposit of this diameter forms a satisfactory mine, as the expense necessary to operate can be readily determined, and when the ore has all been mined the expense stops with the removal of the last ton of ore, and no money need be expended in the fruitless search for more ore where it is known none exists.

The ore bodies are irregular in shape, varying from thin sheets to upwards of 20 feet in thickness, usually thinning out toward the edges. They often occur along or near one of the intrusive dikes, extending from a few feet to 100 feet or more on either side of it. Where the ore bodies are covered with large masses of igneous rock or the overlying sedimentary formations they are reached through shafts and mined in the same manner as other underground deposits, though very few of them have a high angle of dip, lying usually nearly flat. In the early history of their development large amounts of ore were shipped to smelters at Omaha and Denver, even before the advent of a railroad nearer than 180 miles. Ores of this class were high grade. During this period attempts were made to treat the high-grade ores in mills locally, but the failures were so complete that these attempts were finally abandoned. W. H. S.

SULPHUR is a non-metallic mineral. It is found native about many volcanic vents, and sometimes in mines, as a secondary product of the oxidation of sulphide ores. A mine on Cedros island, off the west coast of Lower California, produced specimens of native sulphur which contained about \$100 gold per ton—a very unusual occurrence. Sulphur combines with many metals to form sulphides, sulphates, etc. It occurs more or less abundantly in ore piles that are being roasted for treatment in smelters, the sulphur being driven off from the ore sublimes when approaching the cooler surface of the ore pile, the sulphur being deposited in small crystals on the exposed rock surfaces.

THE barometer falls about one-tenth inch each 90 feet of ascent above sea level, for the first 1000 feet, but the rate of fall continues to decrease, as, for instance, at an altitude of about 5000 feet it falls one-tenth inch for 160 feet in increased elevation. The boiling point of water is also often employed to determine elevation above or below sea level. At 500 feet below sea level the boiling point is 213° F.; at sea level, 212° F.; at 5279 feet it is 201.9° F.; at 10,011 feet it is 193.2° F.;

The Ratcliff Mine.

In the issue of July 12, 1902, of the MINING AND SCIENTIFIC PRESS the editor took occasion to remark: "Mining is to-day the most profitable of all indus-

Originally located by Mr. Ratcliff, this property was purchased a few months ago from J. T. Nichols of Detroit, Mich., W. W. Godsmark of Los Angeles, Cal., and others. It is on the southerly side of Pleasant canyon, on the western slope of the Panamint mountains, 6 miles from Ballarat, 72 miles northeast-

Fig. 1—Gravity Aerial Tramway, Ratcliff Mine, Cal.

Fig. 2—Mill and Camp, Ratcliff Mine, Cal.

Fig. 3—Adit Tunnel, Ratcliff Mine, Cal.

tries, and this commercial fact is attracting capital and enlisting the attention of the brightest minds more and more every year." That assertion is being constantly exemplified. One of the latest enlistments of capital and knowledge is the acquiring of the Ratcliff mine, in Inyo Co., Cal., by the International Equipment Co., with offices in Los Angeles, Cal.

erly from Johannesburg, at an altitude of 6600 feet. There are four full and six fractional mining claims—eight of which are patented—one millsite, and two developed water plant claims, a total of about 150 acres. The mine is on a mineralized zone having a thickness of 150 feet, granitoid strata as a base and quartzite for a capping. The company's claims

cover about 4500 linear feet of this zone. The workable ore bodies, an oxidized portion of the vein, now developed show a varying thickness of from 5 to 40 feet, near the foot wall. A conservative estimate of the average value of this ore body is placed at \$10 per ton.

It is the intention of the company to install labor-saving devices to increase the output and lessen the cost of production.

The men who examined the property for the company estimated that with improved machinery the mine can be worked and the ore milled at a cost of \$3 per ton. These ore bodies consist principally of original strata, impregnated with siliceous iron sulphides and gold, while intercolated with them are high-grade ore bodies or veins consisting of secondary quartz and sulphides. One hundred feet of the mineralized zone intervening between the hanging wall and foot wall ore bodies ranges in value up to \$10 in gold, with an average of about \$4. It is expected that much of this ore can be worked at a reasonable profit when a plant of proper character and sufficient capacity has been installed.

The oxidized portion of the ore bodies, as stated before, is free milling and cyanides up to about 85%. The mine is situated at a vertical elevation of about $\frac{1}{2}$ mile above the mill and all ores are conducted from the mine to the mill by gravity tramways (illustrated in Fig. 1), which are nearly 4000 feet long. The water for the mill is developed by a long tunnel driven in the side of the hill, and is conducted under 1400 feet pressure for a distance of 11,300 feet through a 4-inch pipe line.

The reduction plant consists of a 20-stamp mill and a 50-ton cyanide plant. The capacity of the cyanide plant is to be increased to 100 tons per day. The managers are making a general overhauling of the plant, repairing the old and installing new and improved machinery. The Llewellyn Iron Works of Los Angeles, Cal., is supplying them with a new set of mortars, which will increase the amount of ore possible to put through the mill. Fig. 2 gives a general view of the mill and camp.

Developments in the property consist of five adit levels, with two winzes, between levels Nos. 1 and 2 and 2 and 3, numerous small exploration upraises, winzes, lateral and intermediate drifts and chambers, an open cut 140 feet in length, 50 feet in breadth and 60 feet in height, from which considerable gold has been extracted. Its inner wall, at the mouth of the upper or adit level No. 1, is in pay ore. The aggregate of development work is about 2400 linear feet. C. E. Mort is superintendent in charge of the property. An expenditure of from \$15,000 to \$20,000 is proposed. O. S. BREESE.

Los Angeles, Cal., March 25.

Copper Mining in Upper Michigan.*

NUMBER III.—CONCLUDED.

Written by J. F. JACKSON.

The experiments with long plumb lines noted above suggested the making of experiments with pendulums to determine anew the value of (G) the acceleration of gravity. The only suitable instrument for this purpose was owned by the United States Government. President McNair succeeded in interesting the officials of the United States Coast and Geodetic Survey in the project. The sets of delicate instruments were placed at his disposal and Major Harrod, chief computer of the Survey, was, at his own request, detailed to assist in the experiments which were carried out two or three months ago. Two stations were erected—one at the surface and another 4000 feet below. The stations were connected by telephone and telegraph, and means were devised for determining with great accuracy the differences in times of vibration between half-second pendulums at the surface and at the station 4000 feet below. From the data thus obtained, equations may be written and the value of (G) determined. The results of these tests will be published by the Survey some time next year.

Returning now to No. 5 shaft, you learn that the cage is hoisted at the rate of 50 miles per hour (4600 feet per minute) and that it is loaded and unloaded at top and bottom in a very few seconds. If you are underground at the "plat," or end of the crosscut next the shaft, and the attendant signals for the cage to stop for you, you are apt to be treated to another surprise in the shape of an object lesson on the elasticity of steel cables. When the hoisting engine stops, the cage dangling at the end of 5000 feet of $\frac{1}{2}$ -inch cable jumps up and down 5 or 10 feet, giving the gates or supports on which it finally comes to rest some tremendous thumps.

The inexperienced underground visitor is apt to look with considerable apprehension at the great mass of rock over his head and is disposed to make some inquiries about timbering. The Quincy and several other mines use but very little timber, except in the shafts, and thousands of feet of unsupported hanging wall may be seen where the copper rock has been removed from stopes. At the Calumet & Hecla and Tamarack, however, a great deal of timber must be used to hold up the hanging wall. The Calumet & Hecla use something like 30,000,000 feet per year of

12x12 pine, which is framed by machinery and put in in square sets. The Tamarack, which is on the same lode at greater depth, uses round timber stulls, which are pine logs from 12 inches to 4 feet in diameter, and are set up in groups of three or four which stand close together. There are spaces of 8 feet to 10 feet between the groups or batteries of stulls. These timbers are cut to length at surface, lowered into the mine and set normal to the plane of the lode, where they are wedged tightly into place. This timbering must follow the stoping pretty closely to prevent falling of rock. Where a large area on a particular level or a number of adjacent levels is stoped out, and the timbers have become pretty well decayed, the great timbers crush in and rock fills up the excavation. Miners sometimes hasten the process by blasting out some of the supporting timbers. The caving seldom happens unexpectedly. When it does happen suddenly, men working in the vicinity are sometimes thrown violently for some distance by the force of the air current set in motion.

It is, of course, impossible by the use of timber to support the rock from the surface to a depth of 5000 feet. The pressure would be something like 750,000 pounds per square foot. When caving occurs, the rock seems to break back in the hanging to a strong stratum of rock about 150 feet above the copper stratum which is being worked. Pillars are left on both sides of inclined shafts, so that they do not suffer injury when caving takes place.

At the Quincy mine there are some very large areas of ground at great depth, which are not timbered, and are supported here and there by pillars of poor rock. Recently two severe shocks—not unlike earthquake shocks, except that they came singly and several weeks apart—have been felt in the vicinity of the Quincy mine. Houses situated 2 or 3 miles from the mine were shaken to an alarming extent. Smaller shocks have frequently occurred in previous years, and the common explanation has been that they were caused by "air blasts" in the Quincy mine. In the mine itself, however, but meager effects are observable. Sometimes small masses of rock have fallen from the hanging wall and created a violent current of air. There has been a great deal of mystery about the whole phenomenon, but to my mind it admits of a very simple explanation. The air blast is the effect and not the cause. At the Quincy the rock does not cave in the same manner as at the Tamarack; but movements which occur may extend to some point near or quite near to the surface. There are hundreds of acres dug out at 3000 to 5000 feet in depth. Let us suppose, for example, that five acres in one body had been stoped out at a vertical depth of, say, 4000 feet, leaving only comparatively small pillars of solid rock here and there to support the roof of the cavity. If you calculate the weight of rock lying above this area, you will find that it amounts to something like 60,000,000 tons. Now, if these 60,000,000 tons on our hypothetical five acres happen to get a little uneasy and shift its position ever so little, say, only an inch, or less, I think most of us would concede that sufficient energy would be generated to create a serious disturbance which would be felt at a considerable distance. Let us concede, then, that the power of man to produce earthquakes is one of the latest achievements of modern man to be recognized. As stated before, the caving at the Calumet & Hecla and Tamarack is supposed to extend only 150 feet or so, and that in falling the rock, being broken up somewhat, occupies more space than it did originally; still, when very large areas in the two mines are stoped and caved in, the rock above the 150-foot stratum may give way even to the surface and cause a shock which might be serious enough to damage buildings all over the city.

This predicting of seismic disturbances is somewhat new business to me, but I simply want to make it clear that settlement of ground above a deep mine is a different phenomenon from the caving in of small amounts of earth and rock at an iron mine, or the fissuring or settlement of ground at shallow coal mines. At No. 5 Tamarack shaft house rock is crushed before being sent to the stamp mill. One and one-half-inch cables from the four hoisting compartments of the shaft lead over the four 12-foot head sheaves, which are at the top of the building, 112 feet from the ground level. The illustration on page 199 is that of the No. 5 Nordberg hoist of 6000 H. P., two of which, installed side by side, are required to operate the four hoisting cables. The winding drum, 25 feet in diameter and 20 feet long, and weighing 100 tons, is mounted on a 50-ton shaft, and is rotated at forty-five to fifty revolutions per minute by four engines, two at each end, located as shown. These hoists work in balance and are capable of hoisting six tons from a vertical depth of 6000 feet.

Of late a great deal of attention has been paid to economical steam plants. A number of plants of 1000 H. P. or more have recently been equipped with condensing machinery, automatic stoker and economizers. The Tamarack can store 150,000 tons of coal at the docks. Coal is brought direct by vessel from Cleveland and other lake ports, and the equipment for unloading and handling coal is of the best.

Hoisting drums are run by simple engines; air compressors have usually triple-expansion steam engines, although one of 100 drills' capacity, with quad-

ruple-expansion steam engines, is now being installed at the Champion mine. The builders of this compressor confidently expect to set a new record for high steam economy. The various stamp mills, with two exceptions, are supplied with triple-expansion steam pumps of 20,000,000 gallons or more per day capacity. The Tamarack has a pump of 40,000,000 gallons capacity; the Calumet & Hecla one of 65,000,000 gallons capacity, pumping against a 60-foot head. This pump is rather larger, I think, than any in use in municipal water works anywhere.

The Baltic and Atlantic mills are supplied with water from a storage reservoir on the Salmon Trout river, near where it empties into Lake Superior. The river is dammed by a steel and concrete structure, designed by the writer, which is 74 feet in height by 472 feet long. A full description may be found in Engineering News of Aug. 15, 1901. This dam is notable in that it is the first steel dam of considerable size to be constructed, and particularly on account of the fact that it is a gravity structure—that is, its stability against sliding and overturning is calculated and provided for exactly the same as is done in the ordinary masonry dam. The dam has been in use about a year and seems to be a highly satisfactory structure. It seems to me that a design of somewhat similar sort should especially commend itself for use in volcanic countries, where masonry structures would suffer great damage from earthquakes. Stamp mills are usually placed on the side of a hill near the lake shore at such an elevation that the waste sands and water may flow by gravity through long launders or troughs directly to their point of deposit in the lake. The Calumet & Hecla mill is, however, located on comparatively low ground adjoining Torch lake. The mill has already distributed sands over an area of 100 acres or so where the water was originally 100 feet to 120 feet in depth. The refuse sands from crushed rock amounts annually to something like 1,500,000 cubic yards. For several years the sand and water have been elevated about 50 feet by two great sand wheels. The wheels, 54 feet in diameter, are now being replaced or supplemented by a new wheel, 65 feet in diameter and having 10-foot face. On the center line of the periphery are gear teeth of 24-inch face and 4 7/8-inch pitch. A pinion 37 inches in diameter, with one additional reduction and a 750 H. P. motor, drives the great wheel, at about four revolutions per minute. On the inner side of the rim of the wheel are buckets, which are filled at the bottom of the wheel with sand and water. As the wheel revolves, sand and water are discharged at the top in launders which run out to the lake. In the early days miners looked for mass copper, and one great mass of 500 tons was found. They paid little attention to stamp copper. The first stamp mills were small, crude affairs, using a few of the old-fashioned Cornish or gravity stamps, such as are now in use in the Western gold mines. These were replaced later by Ball steam stamps, having at first only a small daily capacity. These have been developed within the last few years by Milwaukee manufacturers to a daily capacity of 500 tons or more of rock. The steam cylinders are now made 20 inches in diameter, using steam at 110 pounds pressure. The piston stamp shaft and wearing shoe weigh about three tons and make 95 to 105 blows per minute. The stamp shaft is attached to the lower end of the piston rod, is 8 inches in diameter and about 9 feet long. Its bottom is fitted with a chilled cast iron shoe, about 12 inches wide, 16 inches long, 18 inches thick and weighing, perhaps, 650 to 700 pounds. In conglomerate rock a stamp shoe is worn out in about three days. In the softer amygdaloid rock they last about three weeks.

As now constructed, the cast iron anvil upon which the rock is broken weighs from 90 to 120 tons. The anvil and frame of the stamps are supported on a concrete and timber foundation resting on solid rock. This concrete and timber foundation is usually 10 to 15 feet thick and 20 feet square and has anchor rods built into it. So necessary is it to have a solid foundation for stamps that at the Isle Royale mill, where there is a great depth of sand, steel cylinders filled with concrete were sunk 75 feet to solid rock. In the matter of stamp foundations one curious idea seems to have survived an unusually long time. In the early days the iron stamp shafts for gravity stamps were found to break quite often. Experience seemed to show that the metal crystallized when the stamps pounded against anvils resting on solid rock. It therefore became the custom to put in so-called spring timbers—that is, heavy wooden beams supported at each end and having the anvil in the center so as to give a resilient support, something like the lapstone on a cobbler's knee. When steam stamps were introduced, very heavy spring timbers were put in in the same manner, and, indeed, some of them are still in use. A little later it became the custom to put in several layers of 12x12 timbers in this foundation directly under the stamp and anvil. In fact, within the last ten years, the question of whether it would be safe to put in a solid steel foundation was warmly argued, and all superintendents of new mills, with the exception of two, put some timber under the anvils of new stamps which they were installing. At the new Baltic and Wolverine mills solid concrete foundations have, however, been in use several months, proving that modern steel will stand pretty hard usage before suffering destruction through

*Trans. Jour. West. Soc. Engrs., condensed.

crystallization. I have merely cited these facts as a curious example of how an erroneous idea may persist through forty years, and probably cost money all the time, because no one dared sooner refute the accepted theory by actual experiment.

Modern Slimes Plant.

Written for the MINING AND SCIENTIFIC PRESS.

At the Confidence mine, in Tuolumne county, Cal., of which N. Carmichael is superintendent, there is at present in operation a slimes plant constructed with radical changes in regard to tanks, which can not fail to be of interest to mine operators, as the works dif-

to the site of the cyanide works, some distance below; here they pass through hydraulic classifiers and are separated into two products, viz., sands and slimes. After making a number of tests, it was decided that about 30% of the slimes could be treated satisfactorily with the sands, and separation was effected accordingly. The balance of the slimes—about 25% to 30% of the tailings—are treated separately, as described further on. The sands are conveyed from the classifiers to leaching vats, 30 feet in diameter by 5 feet deep, two vats being loaded together, alternately receiving sands and drawing off battery water, and while one set of two vats are loading the other four are undergoing treatment. By this arrangement a six days' treatment can be given.

The tanks are loaded by a Pacific Tank Company's

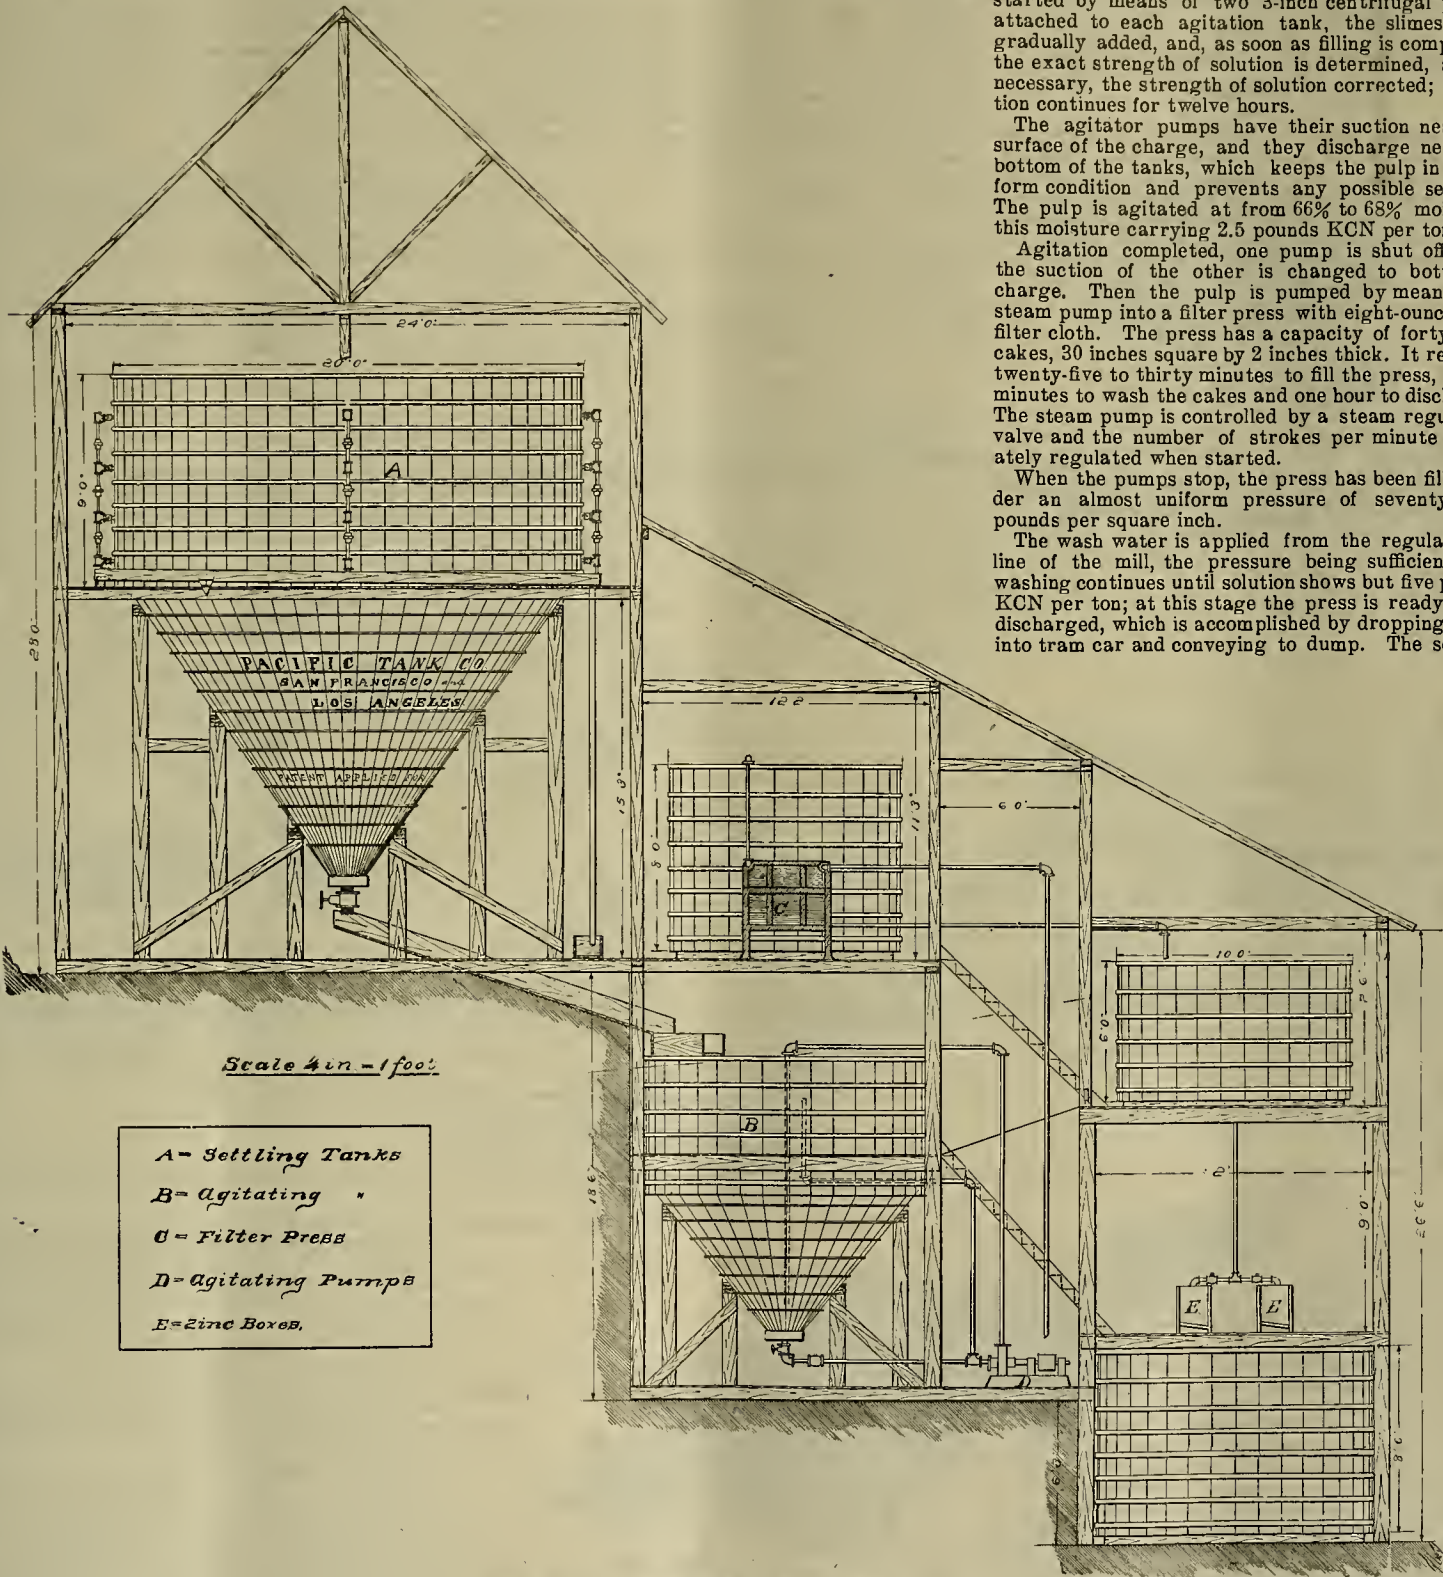

ization being sufficient to flocculate and settle the charge in seven hours; when completely settled, the water is decanted by means of four sets of 2-inch valves running spirally around the tank, each set lowering the water about 18 inches. In this way the decantation is conducted with least possible movement to body of water, no values whatever being carried away. The remaining slimes carry about 40% of moisture, and in this condition the slimes are discharged through an 8-inch gate valve, placed at the lowest point of the settling tank, into a flume leading to the agitating tanks. The agitating tanks are 12 feet diameter, with 8-foot staves and 6 feet depth of cone-shaped bottom, the bottoms sloping 45°. Before the slimes are run into the agitating tanks a certain amount of cyanide solution is run in and agitation started by means of two 3-inch centrifugal pumps attached to each agitation tank, the slimes being gradually added, and, as soon as filling is completed, the exact strength of solution is determined, and, if necessary, the strength of solution corrected; agitation continues for twelve hours.

The agitator pumps have their suction near the surface of the charge, and they discharge near the bottom of the tanks, which keeps the pulp in a uniform condition and prevents any possible settling. The pulp is agitated at from 66% to 68% moisture, this moisture carrying 2.5 pounds KCN per ton.

Agitation completed, one pump is shut off while the suction of the other is changed to bottom of charge. Then the pulp is pumped by means of a steam pump into a filter press with eight-ounce duck filter cloth. The press has a capacity of forty-eight cakes, 30 inches square by 2 inches thick. It requires twenty-five to thirty minutes to fill the press, thirty minutes to wash the cakes and one hour to discharge. The steam pump is controlled by a steam regulating valve and the number of strokes per minute accurately regulated when started.

When the pumps stop, the press has been filled under an almost uniform pressure of seventy-eight pounds per square inch.

The wash water is applied from the regular pipe line of the mill, the pressure being sufficient, and washing continues until solution shows but five pounds KCN per ton; at this stage the press is ready to be discharged, which is accomplished by dropping cakes into tram car and conveying to dump. The solution

Slimes Plant at Confidence Mine, Tuolumne County, Cal.

fer altogether from any other slimes plant now in operation.

The Confidence mine formerly operated a canvas plant, and the problem was how to save the values they were losing in their tailings, since these tailings carried from 50% to 60% slimes of high value.

It was decided to engage the services of A. S. Additon, who for a number of years has thoroughly investigated cyaniding in all its branches, and, after extended experimenting with the tailings, designed the plant now in operation. Acknowledgment is due Mr. Additon for furnishing the following description of the plant:

The tailings are conveyed from the mill in a flume

automatic distributor and are discharged through bottom-discharge doors by sluicing.

The slimes (mostly clay slimes that will pass a 120-mesh screen) are conveyed from classifiers by flume to three settling tanks, 20 feet in diameter, 9-foot vertical staves, beneath which is a cone-shaped bottom 14 feet deep (see drawing), the bottom sloping at an angle of 50°, each tank having a capacity sufficient to hold the separated slimes for eight hours' run of stamp mill. As soon as one settling tank is filled, the slimes are turned into the next one; lime is then added to the full tank by scattering it over the surface, the amount of lime being determined by accurate acid tests, the amount required for neutral-

recovered from the slimes in the press is pumped to the gold solution storage tank, and from there to the standard zinc boxes, where precipitation takes place in connection with filiform zinc.

The extraction of values from the slimes is 98% by this method, and 94% of the head value is recovered.

In the treatment of the sand by percolation 85% is saved, making the total value a very satisfactory saving on a difficult product. The actual cost for treatment does not exceed 85 to 90 cents per ton.

The wooden tanks used in this plant were furnished by the Pacific Tank Company of San Francisco, Cal., who are the sole manufacturers of conical-bottom redwood tanks, having patented this feature. Pre-

vicious to the erection of this plant, the Confidence mine made a good saving from their tailings with a canvas plant, and impounded their tailings after passing over the canvas plant. These accumulated tailings still retaining some values, a tailings plant of 100-ton daily capacity was designed and put in operation by A. S. Additon, who leached 10,000 tons last season with satisfactory results. Owing to a very large percentage of slimes in these tailings, it is impossible to work these during the winter months; but their treatment will continue next summer, and it will require several seasons to clean up this dump; meanwhile the canvas plant has been discontinued and the present plant is taking everything direct from the mill. The successful treatment of slimes has always been a problem confronting cyanide workers, and it is pleasing to note the success of this plant in California.

Hydraulicling Under Artificial Pressure.

The placer miner frequently locates gravel deposits which would pay to hydraulic, but where sufficient elevation is not obtainable to give the required water pressure. The accompanying diagram shows an arrangement which John A. Yeatman & Co., hydraulic engineers, of No. 13 First street, San Francisco, Cal., are putting in operation in Califor-

The Permanganate Process.

To THE EDITOR:—I have carefully read Mr. Stow's article in which he takes exception to some statements that I made in my description of the permanganate process.

In April, 1901, my first tests were made with Dr. Black's process. In August, 1901, I could apply it successfully and at a cost of 30 cents per ton of ore treated for chemicals. That statement can not be taken in any other way. I had not yet applied the process on a large scale, and I had no idea where my first work would be; hence I could not add the freight to my estimate.

In November, 1902, I made a practical run and gave the cost of working at \$2 per ton, which included cost of tailings.

I gave no details; but, in order to put Mr. Stow right, I will add that the total cost of chemicals was 56 cents per ton of tailings delivered at Sierra City. As to the average value of these tailings, I give in detail the first series of practical tests made:

Sept. 21, 1902, five tons of tailings from oldest part of the dump, charged into Tank No. 1, washed and treated with 500 gallons of solution:

Assay value of heads.....	\$14 47
" " of tailings	7 20
Extraction.....	\$7 27
Total recovery of gold after precipitation.....	\$34 80

reasoning is faulty. He recovers \$9.30 gold from material assaying \$18.60, which is 50%. I recover \$6.10 gold from material averaging \$12.20, which is 50%. Yet Mr. Stow claims a greater extraction by 52%.

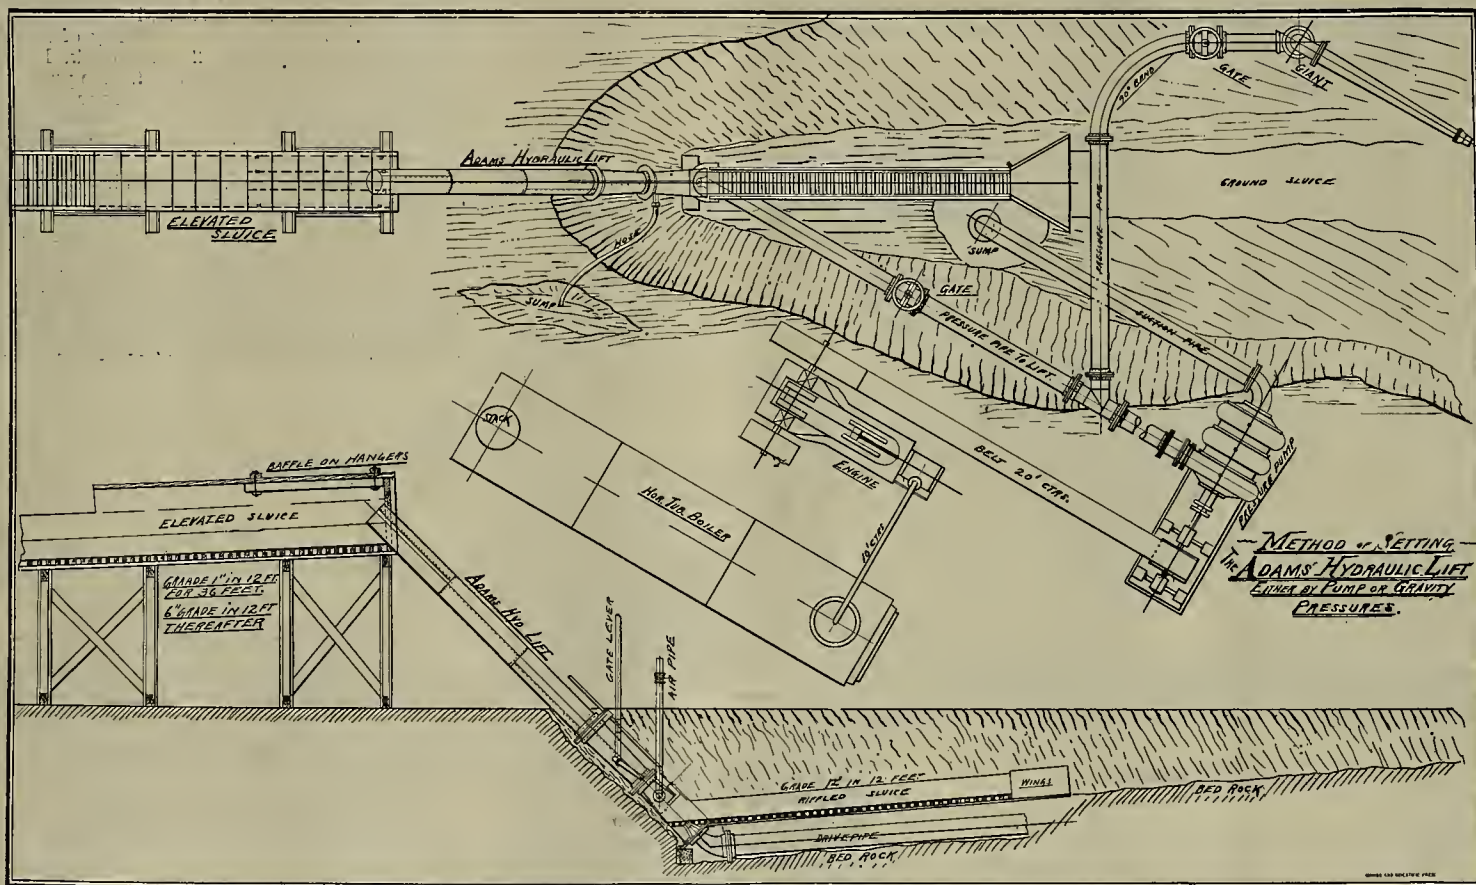

Mr. Stow's recovery of 1.55 ounce of silver is economically impracticable at the present price of silver.

The amount of gold extracted from the tailings by the silver leach is not an advantage, because the same would appear any way by chlorination. If Mr. Stow's silver leach took out gold that chlorination would not effect, then the silver leach would be advantageous.

As to Mr. Stow's application of barrel chlorination, I have this to say:

T. N. Smith, the chlorination expert, at present superintendent of E. C. Voorhies' chlorination works at Sutter Creek, Cal., and myself made many tests by the harrel process and succeeded in making a 50% recovery. We recognized and agreed that the barrel process applied to chlorination tailings would prove successful where the amount of tailings was sufficiently large to warrant the erection of a barrel plant.

My experiments have taught me to draw my conclusions as to the forms in which the gold exists in chlorination tailings, just as I stated in my first paper, and the values at present existing in the old tailings, without one word from me, shows that the operations

nia and in Alaska. Pressure is obtained, if a sufficient quantity of water is available, by a series, pressure, high-head, three-step centrifugal pump. This furnishes pressure for both the giant and the gravel elevator. The 6-inch pump is designed to give the equivalent of 250 feet head, but gives the best results operating at 180 to 200 feet head. The horse power required to run it is 62 when handling 75 miner's inches, and 82 H. P. for 100 inches. With the gates on the branch pipes, the giant and the elevator may be operated singly or simultaneously. The Adams hydraulic lift takes care of the tailings—this requires 5 feet head of pressure water for each 1 foot of lift (i. e., to elevate 20 feet will require a 100-foot head). The lift has a removable throat of sheet steel which takes the wear and is easily and quickly replaced. Two sizes of nozzles are used. The opening is controlled by a sliding door—regulating the size of houlders admitted. One of its features is an air vent, opening into the side of the throat (see lower part of diagram). By this, in case the lift becomes submerged, air is admitted and the column of water and gravel in the pipe readily started upward. By attaching a hose to this air vent, small sumps and pot holes may be pumped out. The elevator is built of sheet steel and in sections, so that it can be readily transported by pack animals. The series, centrifugal pump is also built in sections.

The discovery of gold is reported at Arltunga, in the northern part of South Australia. The new district is reported to have produced rich quartz specimens. The mines are about 1000 miles north of Adelaide.

Or \$6.96 per ton. Solution then run into the copper tank.

Oct. 1, 1902, a similar test made on tailings nearest old works:

Heads.....	\$9 20
Tails.....	4 10
Total recovery from 5 tons.....	24 60

Or \$4.82 per ton. Solution run to copper tank.

Oct. 9, 1902, a third test was made on tailings taken from all over the pile:

Heads.....	\$12 60
Tails.....	7 20
Total recovery from 5 tons.....	28 00

A summary of the three tests is as follows:

15 tons of tailings, total assay value.....	\$181 35
15 tons of tailings yielded in gold.....	87 40
10 pounds copper residue, @ 60c.....	6 00
Total gold recovery.....	93 40

There is a discrepancy between my assaying and recovery, in that the total value by heads assays was \$181.35, while my tailing assays, plus the total recovery, shows \$185.90; but the most careful work was done on these tests; and, as a whole, the work was as accurate as possible.

We have had many tanks as low as \$8.20 and a few as high as \$18.60; but the average has been about \$12.20, and our recovery has averaged 50% on rich and poor. I must say that my work here is a far better basis on which to figure the average value of the tailings as a whole, based as it is on a great number of assays, than Mr. Stow's one sample sent to him, from which he estimates the value of these tailings at \$18.60.

A comparison of results shows that Mr. Stow's

at the old plants were faulty. But it must be remembered that the men who operated these plants were the pioneers in chlorination and had to depend upon inexperienced roasters and generator men and had to work concentrates that were far from clean. Today we have the advantage of experienced men, cleaner concentrates, better furnaces, and, where oil can be used, a far better fuel.

With oil as a fuel, the roasted product from a furnace is far superior to the product of a furnace where wood is used, and the values left in the tailings are consequently much lower.

Without making any comparison with harrel chlorination, I believe, from my own tests, that the permanganate process is superior in many respects to the ordinary vat chlorination.

In conclusion, I should like Mr. Stow to suggest a better method of treating a small pile (800 tons) of chlorination tailings 47 miles from the railroad, and would like to ask why Mr. Stow did not work these tailings if he could make a recovery of \$9.30 in gold and 1.15 ounce of silver per ton? These tailings have been for sale for a number of years.

D. F. MEKLEJOHN.

Tailings at Ely, Nevada.

To THE EDITOR:—L. F. Shepard of Ely, Nevada, quotes some results on samples obtained from the tailings dump of the Chainman mine.

Mr. Corning's samples of the dump, as far as the writer remembers, averaged \$2.80 per ton.

These were taken over the slope of the dump and represent the last tanks discharged, among which

were the two quoted as being run without lime and averaging \$2.11 per ton, and, considering the fact of the occurrence in this ore of occasional specks of free gold, may be taken as a practical check.

The high sample taken from the tank was taken from the face of four boles dug in the tank at the time of draining, when the ore contained not less than 40% of moisture, and may clearly be considered as due to superficial enrichment on the surface by evaporation, a condition the writer called attention to in his first article.

In the company's prospectus appeared a statement to the effect that "there was in the mine more than 100 000 tons of 'ore in sight,' of an average value exceeding \$11 per ton."

In view of the fact that this statement was based very largely upon the report of Mr. Shepard, the (at that time) general superintendent of the property in question, a word to the wise should be all sufficient.

WINTHROP H. WICKHAM.

The Chemistry of Ore Deposition.*

By W. P. JENNEY, E. M., Salt Lake City, Utah.

At Silver Reef, Utah, silver has been deposited in lignitic sandstones, determined by Newberry to be of Triassic age. The mines since 1885 have only been worked by lessees in a small way. During the height of production in 1877-79 the total output was 2 122,471 ounces of silver. The ore-bearing beds were 30 to 40 feet in thickness, of which usually only 16 feet was pay ore. The ore occurred in flat shoots that were, in some places, 300 feet wide, and extended 400 to 500 feet deep on the dip of the formation. The ore was richest near the outcrop, and, as it was followed in depth, gradually got poor. Near the surface the silver was in the form of chloride, associated in places with the blue and green carbonates of copper in very small quantity. As the ore was followed in depth, the chloride gave place to silver sulphide, and scales of native silver came in, especially in the branches of trees and distributed in the plant shales. No other ores were found, and the gangue minerals usually occurring in ore deposits, as quartz, calcite, barite, etc., were absent. When, following the inclination of the strata, the workings attained a vertical depth of 400 to 500 feet, the ore changed, becoming low-grade and difficult to amalgamate in pans, the ore shoots at the same time contracted, becoming narrow, and only 2 or 3 feet in height. Exploration was continued for several years, but finally all search in depth for pay ore was abandoned.

Many writers report that traces of silver and copper occur in the extension of these same sandstone reefs, which can be traced by their outcrop for a distance of 10 to 20 miles to the southwest. An unknown author, in the early development of the district (May, 1877), thus describes the peculiar occurrence of the ore: "The formation is a beautifully stratified red and white sandstone, but greatly broken up and eroded. Where the strata have been undisturbed they rise to a height of perhaps 1000 feet above the adjacent valley, in table mountains, alternately banded in red and white, and plainly showing the former height of the whole country. The numerous extinct volcanoes and vast quantities of volcanic rock found throughout southern Utah, and particularly this section, point to at least one agent, and no doubt a powerful one, which served to produce the numerous foldings and contortions of the strata, while the great sandy deserts, covered with sage and cactus, bear abundant evidence to the erosion. On the northern side of what was once a vast basin, lying between several ranges of high mountains of old rock, where the erosion of an anticlinal has left ridges of reefs cropping out at various angles, are situated the mines. * * * The sandstone consists of red and white deposits, carrying some lime as cementing material, with occasional layers of clayey or sandy rock, and considerable carbon scattered throughout. This carbon, which is evidently from the decomposition of drift material, of which the impression in the rock and even the plant itself is yet distinct, occurs in important layers in places. * * * Petrifications are not uncommon, some of which form a valuable ore. The white sandstone, which appears to have been of a somewhat finer texture than the red, seems, so far, to have carried the ore. * * * These veins, as they are called, are entirely conformable with the strata, and in no case do they cut across the adjacent layers of rock. They appear to be richest where there is the most carbon, which evidently has acted as a reagent to precipitate the silver from solution and to deposit it sometimes as flakes of metallic silver. In some cases the form of the plant, of apparently a reedy nature, is yet distinct, in which the cells are yet visible, but to a great extent filled with valuable ore. Other beds carry considerable copper in the form of blue or green carbonate, and also iron in nodules which run very high in silver. * * * A light sandstone, containing streaks or fine layers of a dark material, which elsewhere would not attract attention, is there found, sometimes, to run from \$50 to \$100 a ton, while the darker rock, containing considerable carbon, cop-

per or iron nodules, will at times run into the hundreds, or even thousands."

W. M. Nesbit, who was connected with mining operations at Silver Reef from 1878 to 1888, gives the author the following statement of the manner of occurrence of the ore: In the Barbee & Walker mine water was struck at a depth of about 500 feet vertically. Near that point the ore changed in appearance and character, and gave great trouble in amalgamation, the extraction being very low. The ore was treated bot, in pans; a thick scum rose on the pans, like heavy petroleum oil, and had to be removed from time to time during the amalgamation. From a charge of 1½ ton of ore as much as a gallon of this oily material would be obtained. The ore at water level, if carefully stoped, averaged 12 to 16 ounces of silver per ton, but only a part of the silver could be saved in the pans. A very little pyrite appeared at water level—the first seen in the mines. About 100 to 200 feet above water level, on the slope of the beds, the ore was in places very rich, and small bunches of lignite coal, 4 to 10 inches across, were found imbedded in the soft sandstone, with native silver deposited in thin scales on the joints of the coal. Most of the ore at this depth was silver sulphide. At one place a tree trunk, 18 inches in diameter, was found. The heart wood was silicified and very hard, and carried 8 to 10 ounces of silver per ton. The sap wood and bark, 3 to 6 inches in thickness, were altered to soft, crumbling lignite, full of silver sulphide. It assayed 5000 ounces of silver per ton. The ores from the Silver Reef mines never showed any gold by assay, but in leaching the ore by the Russell process the silver sulphides produced contained a trace of gold.

Light is thrown on the change in the mineral character of the ore at water level, and on the difficulty experienced in amalgamation, by the discovery that the ores carried selenium, the average of four analyses giving 0.23% selenium and 0.26% silver. The selenium in one specimen amounted to 90 ounces per ton.

The structure at Silver Reef may be stated as a broad anticlinal arch, broken up by faults coursing northerly and southerly, rudely parallel to the axis of the fold. A basin, nearly 3 miles across, occupied by the valley of the Virgin river, was eroded through the crest of the arch, leaving the two cliffs facing one another, the strata dipping away from the basin on the two sides. The total area of the several ore-producing belts of sandstone outcrop, left by erosion, covered less than 500 acres.

Silver Reef conforms to the general law of areal distribution of mining districts, namely, that "ore deposits have been formed only in local areas of disturbance. Between and surrounding such areas of mineralization extend broad, barren tracts of undisturbed strata," and also conform to the law of mineral occurrence, namely, that "all workable deposits of ore occur in direct association with faulting fissures traversing the strata, and with masses of crushed and shattered rock, produced by movements of disturbance. The undisturbed rocks are everywhere barren of ore." The descriptions apply to a mineral area which, prior to the recent erosion of the basin, may have possibly covered 4 or 5 square miles, with pay ore found in no place outside this special area.

A writer notes that only the fractured, jointed and permeable portions of the bed are rich; where undisturbed and massive, the sandstone is barren. Also that vertical fault planes frequently bound the ore. These are conditions that are found in impregnated beds of zinc and lead ores in southwest Missouri and northern Arkansas, and also in the flat deposits of gold, associated with tellurium, in the

fissures. It appears that secondary enrichment has taken place on an extensive scale, and that the silver was deposited originally in the sandstone in combination with selenium and probably with sulphur by the reducing action of the lignitic matter. Afterwards these primary ore bodies were enriched by the secondary precipitation of silver sulphides, by the agency of descending surface waters, aided greatly by the progressive erosion of the basin.

The Mietz & Weiss Kerosene Engine.

This engine, the general appearance of which may be seen from the accompanying illustration, is manufactured by Aug. Mietz, 128-132 Mott St. and 87 Elizabeth St., New York City, and is claimed to be among the very best apparatus of its kind in the world. It is said to embody all features necessary for the production, with perfect reliability, of the maximum of power with the smallest consumption of gas or kerosene. The drawbacks and defects ex-

Mietz & Weiss Kerosene Engine.

perienced in other engines are claimed to have been avoided in this type and many improvements added. On account of its simplicity, this engine is particularly adapted for the use of common kerosene or lamp oil (50° test), and when so arranged, it is absolutely the safest and simplest power-producing machine conceivable. A catalogue giving more definite information in regard to this engine will be sent by Mr. Mietz to anyone who is interested in the subject.

New Portable Cylinder Boring Bar.

The accompanying illustration shows a new portable cylinder boring bar, designed for reboring all makes and sizes of steam engine cylinders, pump cylinders, gas engine cylinders, air compressors, blowing engines, mining and hoisting engines, Corliss engines, hydraulic cylinders, etc. The bar is made of a hollow steel tube accurately turned and ground to size; the tool head is so arranged that the tool can be fed out and the back counter bore of a cylinder can be rebored without changing the bearings of the bar. It is easy to face a joint or flange of the cylinder without putting any cumbersome attachments on the bar; this will be found very convenient on pump repairs. The feed gears and screw are made of steel and the feed nut of the best bronze. There is also a right-angle drive that can be used in boring vertical cylinders, and also in boring horizontal cylinders where the side of the cylinder is too close to the wall of the building. These bars are made in all sizes to bore cylinders from the smallest up to 72

New Portable Cylinder Boring Bar.

Cambrian sandstone near Deadwood, South Dakota.

Selenium usually occurs with minerals believed to have been formed by highly heated vapors and solutions and in direct association with igneous disturbances. Its presence at Silver Reef seems to favor the theory of the deposition of the silver through the

inches diameter, and larger sizes if required. The bar is driven by a train of cut gears, either by crank, belt or sprocket chain. The cut shows all attachments with the bar for boring cylinders with one bead removed. An additional cross plate and bearing for boring cylinders where both heads are removed is furnished. Each bar has two tool holders with two self-bardening steel tools. These bars are manufactured by Hugh Mathews, Kansas City, Mo.

THE discovery of a new district in which native copper occurs is reported in Canada about 300 miles north of the copper mines in Michigan, on Keweenaw point.

*Trans. Am. Inst. Min. Engs.

Mining and Metallurgical Patents.

PATENTS ISSUED MARCH 24, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

METALLURGICAL AND CHEMICAL FURNACE.—No. 723,251; C. A. Doremus, New York, N. Y.

Furnace which consists of horizontally rotating covered hearth, on which materials to be treated are spread, burners placed radially within furnace and extending over surface of hearth in such position as to project flames issuing from them upon hearth.

PROCESS OF CONCENTRATING ORES.—No. 723,362; H. F. Campbell, Melrose, Mass.

Process of concentrating ores to remove definite proportion of constituents capable of being rendered paramagnetic, consisting in heating ores to render constituents paramagnetic and passing same through magnetic field of strength inversely proportioned to degree of exposure to heat.

APPARATUS FOR CHANGING WINDING ROPES IN MINES.—No. 723,437; A. Beien, Herne, Germany.

Combination of winding reel a upon which substitute rope is wound, friction-gear steam crane b provided with two drums around which substitute rope passes from reel a in single convolutions side by side, rope wheel c under which substitute rope passes to be temporarily connected to rope to be replaced, driving wheel e and rope wheels d, f, for driving and guiding rope, and reel g upon which rope to be replaced is wound.

FURNACE FOR LIQUID FUEL.—No. 723,564; A. Wengenroth, West Hoboken, N. J.

Conduit for liquid fuel, composed of troughlike base having semicircular depression in upper face and top piece fitting into base, having longitudinal groove approximately in center, of transverse grooves at intervals, perforations communicating with longitudinal groove.

MELTING FURNACE.—No. 723,443; F. H. Daniels, Worcester, Mass.

Furnace comprising firebox, main chamber, floor forming melting basin, with facilities for drawing melted metal therefrom, preheating chamber or annex extending from basin toward exit flue, having floor overlaid with water pipe for supporting materials charged, pipes being arranged to permit feeding of miscellaneous scrap, feed door at outer end thereof, stock car and tramway adjacent to feed door, mechanical charger disposed opposite feed door adapted for transferring carload of material from stock car into preheating furnace chamber.

TREATING COPPER ORES AND ORES OF COPPER AND NICKEL.—No. 723,500; H. C. Thofehn, Paris, France, and B. de Saint Seine, Widnes, England.

Treatment of copper ore, matte of copper and raw copper in reverberatory furnace, consisting in blowing into furnace on surface of bath mixture of superheated steam and air carrying silica and lime.

PACKING DEVICE FOR DRILL RODS OR THE LIKE.—No. 723,740; B. Selfridge, Butte, Mont.

Longitudinally split bonnet, means for attaching bonnet to cylinder of drilling machine, longitudinally split sleeve in bonnet and forming along length, surface closely embracing piston, stuffing-box on bonnet, stuffing-box having longitudinally split gland, inner end of bonnet being spaced from outer end of sleeve to receive packing between them.

PROCESS OF EXTRACTING METALS FROM ORES.—No. 723,787; S. Trivick, Clapham, England.

Process evolving nascent chlorine and effecting

chlorination of metallic substances that may be extracted from metalliferous mass by rendering them solvent, consisting in adding to mass mixture of dry chloride of lime and a metallic salt, proportions being such as to result in formation of hypochlorite of metal of added salt and chloride of metal which will evolve nascent chlorine.

FUSE SPLITTER AND CAP CRIMPER.—No. 723,520; J. Fischler, Silverton, Colo.

Fuse splitting device consisting of pivoted handles, blade carried by extension of one of the handles, jaw carried by other, elastic plates fixed to jaw, separable blocks carried by plates and guides extending above blocks, stop at inner end of splitting block, against which fuse abuts when being split.

BUCKET DUMPING APPARATUS.—No. 723,771; T. E. Anderson, Denver, Colo.

Combination with suitable frame, of bucket holder, counterbalance normally holding holder in elevated position and in path of bucket to be dumped, means connected with bucket holder for supporting latter in operative position on frame and adapted to invert holder and bucket as they are carried downwardly by gravity of load which overcomes counterbalance.

Southern California Enterprise.

TO THE EDITOR:—The city of Santa Barbara, Cal., will increase its domestic water supply by the completion of a tunnel beneath the Santa Ynez range of mountains, near that city, and the construction of a storage reservoir in the basin of that river. The total length of the tunnel would be over 19,000 feet. About 5000 feet of this has been constructed in small contracts of from 500 to 1000 feet at a time. It is now proposed that the city should vote bonds for the completion of this tunnel, letting all the remaining portion of the tunnel in one contract. The tunnel will be approximately 5x7 feet, run in a sandstone and shale rock from both headings, but without any intermediate shafts. It will call for mechanical devices for handling the material out of the tunnel, and also for effective air compressing machinery.

The bond election has been called in Santa Barbara, and there seems to be little opposition to its passage. Bids will then be called for for the completion of this tunnel. The building of the storage reservoir will follow the completion of the tunnel.

I give you this information as the city would be glad to have contractors who read your publication bid on the work.

Communications may be sent in this connection to E. S. Sheffield, Chairman Board of Water Commissioners, Santa Barbara. J. B. LIPPINCOTT, Los Angeles, March 28. Consulting Engineer.

The bond election carried by a large majority, and the work will go on.—ED.

Sound travels faster in a heated atmosphere than in a cold one. At 30° F. below zero sound travels 1030 feet in one second, at 60° above zero at 1120 feet, and at 120° F. 1180 feet per second. Sound travels faster through a denser than through a rarer medium. The distance that sound may be heard through solid rock in mines varies greatly, depending upon the character of the sound and the kind of rock. If there are zones of soft ground these tend to deaden the sound. The strokes of a machine drill may be heard through 300 to 400 feet of hard rock, and possibly further. Blasting can be heard from 1000 feet to 1500 feet, and in some cases at a still greater distance.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

At least ten companies or private concerns will have drilling outfits at work in Alaska before June 1, says the Pacific Oil Reporter. There are three principal oil districts—Cold Bay, Cook's Inlet and Kyak.

ARIZONA.

COCHISE COUNTY.

P. G. Sawyer of Kansas City, Mo., and E. Smith of Douglas, directors of a company of Douglas and Kansas City men, operating near Douglas, say a 10-stamp mill and other machinery will be put in this spring. The mine is in the Pineta mountains and shows free milling gold ore.

The Bisbee Superior Development Co. has incorporated at Houghton, Mich., to develop a group of claims 4 miles north of Bisbee. Superintendent Wilcox of the Mass mine at Mass City, Mich., is a director.

The Burns group of copper mines, 25 miles from San Simon, are reported sold, and J. H. Knowles of Solomonville is superintendent.

GILA COUNTY.

The report of the Old Dominion M. Co., at Globe, for the year ending Dec. 31, 1902, shows the production of refined copper to be 7,992,550 pounds, as against 10,094,787 pounds in 1901. It is expected when the improvements in the plant are completed the production will be at the rate of 20,000,000 pounds of refined copper per annum, says the Citizen.

Finletter & Harvey are shipping ore to the smelter from their Keystone mine, near Oak Spring, near Globe. The ore averages 20% copper, says the Silver Belt.

W. Pobl and H. T. Wendleborn, who have a lease on the Big Johnny mine, near Globe, are delivering ore at the smelter. The ore runs 20% copper and carries silver.

W. H. Mercer and J. A. Valentine of the Mercer Tunnel Co., operating at the head of Mineral creek, near Globe, say the tunnel is in 600 feet, and, to provide better air, a gasoline engine has been set up to run the blower. It is intended to put in power drills to hasten the work. The tunnel is in a low-grade sulphide for the greater part of its length.

GRAHAM COUNTY.

The Shannon Copper Co., at Metcalf, resumed the production of copper last week, says the Arizona Bulletin. The concentrating plant has been in operation for two weeks. During the construction of the concentrator work has been pushed in developing the ore bodies of the mine. The company owns a group of several claims near Metcalf.

MOHAVE COUNTY.

(Special Correspondence).—A gold discovery is reported in the Colorado river range, 9 miles west of Chloride. M. Dempsey and W. O'Dea, who made the original discovery, are sinking on their find with good results, the ore being worth \$150 a ton in gold. The pay shoot is about 5 inches wide, in a shaft down 8 feet. The gangue is lime spar. Work is being done by others on the same vein. Many locations have been made and a camp has been established in the new district.

In the Chloride district the S. Smith gold discovery on the Emerson mine is proving, with development, to be a bonanza. The discovery was made in sinking a shaft at water level, 70 feet from the surface, where a crosscut has developed 7 feet of ore. Assays run two and a half ounces gold to the ton. H. Shaefer of Los Angeles, Cal., is interested with Smith.

A gold strike, 3 miles east of Chloride, has been made by J. Flynn on the south extension of the Samoa.

The Philadelphia & Arizona M. Co. have put in a steam hoist at the three-compartment shaft on the Mother Lode mine. A body of gold, silver and copper ore is being developed. Water for the 225-ton concentrating plant at the Minnesota mine, 1/2 mile distant, will be supplied by this shaft.

The Elkhart mine has a large tonnage of milling ore in the mine and on the dump. The 100-ton mill is running on full time. The mine is producing less shipping ore than formerly.

The Altata, Redemption, Clyde and Samoa are also doing well and developing. It is reported that the 300-ton milling and cyaniding plant of the Gold Road Co. at Acme will be in operation by June 1. Development is being done in the mine.

The Queen Bee mine at Mineral Park,

under bond and lease to J. Deter, is producing high-grade silver ore, and a new steam hoist has recently been put in.

Chloride, March 31.

The Sheeptrail group of mines on the Colorado river, near Kingman, have been sold to the New Comstock M. Co., says the Searchlight. The sale includes a 20-stamp mill, cyanide plant, hoisting works, air compressors and power drills. It is intended to build a railroad from the mines to the mill, which is on the river, a distance of 6 miles. The mine is 10 miles north of the Gold Roads group. S. C. Bagg is manager.

A. B. Robbins is operating a 20-ton cyanide plant at the Cyclopic, in Gold Basin district, near Chloride, with H. Barnes superintendent. He has fifteen men at work developing the mine and is testing the ores. The Cyclopic is a blanket ledge 1 1/2 mile in length, 200 feet wide and 10 feet thick, the ore averaging \$8 in gold per ton.

SANTA CRUZ COUNTY.

The Santa Cruz M. Co. will put in a steam pump and a hoist at their mine near Nogales, and sink the shaft to 300 feet.

YAVAPAI COUNTY.

The Yeager Canyon Copper Co., near Jerome, has sunk its shaft 630 feet in the incline and ore is blocked out in several levels. It is said reduction works are contemplated.

G. W. Hull, president and manager of the Cleopatra C. Co., near Jerome, says he will increase development work on their group and a smelter is proposed.

Manager Parker of the Palo Alto group of copper and gold mines on Eugene gulch, near Prescott, says a mill of fifty tons daily capacity will be put in this spring.

The Hackberry mine, near Bighug, owned by the Treadwell M. Co., has men at work and the shaft has been unwatered. Ore is showing in the bottom.

The Ideal M. Co. has bonded the Blake mining group, on Groom creek, near Prescott, and will put in machinery and begin sinking a double-compartment shaft 100 feet deep. Later on they will put in a steam-power stamp mill. This company is operating the Canaris mine, 2 miles from the Last Chance, and last week shipped a carload of ore to the Sharpneck mill.

At the Gold Link mine, 18 miles from Hillside, in Santa Maria district, a 20-stamp mill and cyanide plant are being erected.

LOS ANGELES COUNTY.

The Whittier-Fillmore Oil Co., near Whittier, began pumping their first well last week, averaging 125 barrels a day. The hole is 2300 feet deep.

SISKIYOU COUNTY.

The Scott Valley Advance says Manager Hickey of the Hickey mine on White's gulch, near Etna, reports development work progressing. A 3-foot vein of gold quartz has been opened up, and he will probably put in a mill this spring.

CALIFORNIA.

AMADOR COUNTY.

G. W. Horn and G. S. Andrews have bought the Porteous mine, adjoining the Horn mine near Defender, for \$3000. A tunnel runs through the Porteous to the Horn claim.

J. J. Cranmer has bonded the Emmons mine at Pine Grove for two years at \$4000. Cranmer Bros. have been operating a 2-stamp mill on the Blakely mine on Elsie creek, which is thought to be on the same vein as the Emmons mine.

BUTTE COUNTY.

C. Faul and A. T. Haynes are erecting a 4-stamp quartz mill on their mine—the Jennie May—at Bidwell Bar, near Honeycut. They have 150 tons of quartz on the dump ready to mill, a former test run of which yielded \$13 a ton.

The Gold Bank mine, near Forbestown, has forty men at work and the mill and chlorination works are in operation.

The Miller mine, near Forbestown, will be reopened. The development consists of an inclined two-compartment shaft 200 feet deep, with a drift at the 150-foot level, 325 feet on the vein and 80 feet of crosscuts, a drain tunnel 1000 feet long connecting with the shaft at the 200-foot level, and 600 feet of tunnel on two veins.

CALAVERAS COUNTY.

The '49 Gold Placer M. Co., operating near Douglas Flat, is preparing for heavier operations this season. They have a three-compartment shaft down 60 feet, on which they are erecting a hoist and will put in two 14-inch plunger pumps. The hoist will be fitted for either steam or water power, the latter being used most of the time. J. M. Evans, superintendent, has twenty men at work.

The Crystal mine at Angels is down 500

feet and good rock is being found, says the Record.

EL DORADO COUNTY.

O. A. Ingraham has bought the McGraw & Peters 5-stamp mill and engine near Kelsey and will move them on to a prospect he is developing near El Dorado.

A hoist is being set up at the Eureka slate quarry at Kelsey to be used in connection with the air compressor.

INYO COUNTY.

The Reward mill, near Bishop, began work with ten stamps this week, and the other ten will be dropped next week. It is run by electricity, generated by the company's dynamo, says the Inyo Register.

KERN COUNTY.

T. O. Turner, manager of the Eastern Con. Oil Co., at Kern river, near Bakersfield, says his company will begin construction work next week on its refinery. The refinery will have a capacity of 1000 barrels a day—five stills of 200 barrels each. The company has eighty acres in the building site.

The Menona Oil Co. has incorporated to operate near Bakersfield, principal place of business San Francisco, with J. W. Anderson, W. W. Allen, Jr., M. Burns, C. E. Benson, C. O. Huber, directors.

J. M. Wright, president of the Peerless Oil Co., has leased several sections of oil land west of McKittrick.

The Yellow Aster M. Co., near Randsburg, has both its mills running steadily. A timber-framing machine will be added to the carpenter shop.

MONO COUNTY.

J. L. Wedekind, part owner of the Golden Gate mines, near Bodie, says they have incorporated under the name of the Wedekind G. M. & M. Co., and, as soon as the snow melts, will begin to erect a mill. The ore is free-milling, assaying \$35. A crosscut is being driven to tap the vein at a depth of 100 feet.

NEVADA COUNTY.

Underground operations began this week at the Slate Ledge mine at Forest Springs, near Grass Valley, owned by the New York-Grass Valley Co. Grading for the mill is finished, says Manager G. W. Root. The mill will have eighty tons daily capacity. A water power hoist has been put in.

At the Black Bear mine on Deer creek, near Nevada City, owned by D. B. Marwick, W. Torpie and C. Schroeder, a 3-foot vein of quartz carrying free gold and sulphides is reported opened up, and a stamp mill is proposed.

An additional air compressor capable of developing 300 H. P. is being set up at the power house of the North Star M. Co., near Grass Valley, says the Tidings. This will make a total capacity for the plant of 700 H. P. A. D. Foote is superintendent.

It is locally reported that the North Star M. Co. at Grass Valley is about to take over the holdings of the Gold Hill M. Co., of which R. Walker is superintendent.

The Allison Ranch mine, near Grass Valley, is reported by the local papers closed down and the pumps pulled.

The Ironclad mine, at Rough and Ready, E. Morgan superintendent, is running its 2-stamp mill steadily. Drifting and stoping are going ahead on the 200-foot level north, and the incline will be sunk deeper. It is believed the developments will warrant putting in a 10-stamp mill next summer. The company owning the Hudson, on Deer creek, will resume.

The Slate Ledge mine (the Perrin mine), at Forest Springs, near Grass Valley, is being reopened by the New York-Grass Valley Co. A. W. Culp is manager. The shaft is down 540 feet below the drain tunnel.

PLACER COUNTY.

The Blue Canyon M. & D. Co. at Blue Canyon will drive an additional 400 feet in the Azalla tunnel.

The Annie Laurie mine, 5 miles from Colfax and near the American river, has been sold to Manager Russell, says the Sentinel. He will begin development next week.

Five stamps are to be added to the mill of the Shady Run mine near Blue Canyon, of which R. A. Watson is superintendent.

The Fowler & Gallagher placer claims on the American river near Colfax are to be worked by a dredger, with F. B. Jackson, of Sacramento, superintendent.

SAN BERNARDINO COUNTY.

The Times-Index reports W. Slocum of Monrovia is preparing to erect a 5-stamp mill on his mines near Barstow.

SAN DIEGO COUNTY.

A strike of rich ore is reported in the Washington mine, near Julian. Ore is being taken out of the ledge of the Oroflamme mine at Banner.

SANTA BARBARA COUNTY.

It proposed at Lompoc to erect storage tanks near the beach and load the oil into vessels by means of rubber hose. From the wells to the sea is a sufficient difference in elevation to pipe the oil to the coast without the necessity of pumping.

SHASTA COUNTY.

Manager Keating of the Bully Hill mine at Winthrop, 13 miles from Redding, says the negotiations for a consolidation of the Bully Hill and Mount Shasta mines, that have been pending for several months, are off and that De Lamar will hereafter conduct his Bully Hill mines with his own company.

A strike has been made on the 570-foot level of the Bully Hill copper mine at De Lamar (Winthrop), says Superintendent Anchor. The ore body varies in width from 2 to 12 feet. At the smelter coke and fluxing materials are accumulating and the ore bins are being filled. Lime rock is being hauled from Grey Rocks, 5 miles distant.

At the Tamarack mine at Copper City, near Winthrop, owned by Wall & Meyer, 5 feet of copper ore has been opened up 100 feet from the surface in a tunnel which runs in at a depth lower than that reached by the main shaft.

At the Minnesota mine on Town Creek mountain, the owners, J. T. Wall and C. J. Teass, are doing development work.

SIERRA COUNTY.

(Special Correspondence).—M. D. Howell, who has the Grey Eagle mine, near Sierra City, under bond, has cut a ledge of free-milling rock in two crosscuts and has 12 feet of \$3 ore in the face of the main tunnel. Howell expects to develop the mine extensively. At the Keystone mine, near Sierra City, the vein was cut several weeks ago and has increased gradually in size until the face of the drift shows 5 feet of quartz. An Eastern company expects to open up the San Louis and Santa Zahina mines early in the spring.

Sierra City, March 28.

SISKIYOU COUNTY.

(Special Correspondence).—This is an excellent water season and everything is booming in placer and quartz mines. The Y. M. & M. Co. is in steady operation and will have a good season. A strike of ore in the Mountain Laurel mine shows rich sulphurets plentifully sprinkled with free gold. A sale of this property is pending. The new company expect to open up on a large scale.

At present there is a scarcity of good miners in this country. Men are put on as fast as they come along, but there are not enough to fill the bill.

A. J. Ball will put up a small mill this spring to work the ore already blocked out in his mine.

L. A. Carter of the Cliff Top mine is taking out good ore and expects a prosperous season. It is likely that the Fagundes mill at Rollin will be kept busy this spring and summer crushing custom ore.

Rollin, April 1.

H. Mattern will start up his quartz mill at Rocky gulch, near Hornbrook, as soon as wood can be obtained for making steam.

SONOMA COUNTY.

The Devil Creek M. Co. has incorporated at Healdsburg; A. Gintner, H. Graper, G. Seebaker, J. G. and F. W. Ortman.

TRINITY COUNTY.

J. H. Porter, superintendent of the Fairview mine near Minersville, says he has twenty-three men at work, and the mill is crushing 1000 tons of ore per month. The company intends to add ten stamps to the mill, which will be in operation by June 1st.

Near Dedrick, the tramway from the Jenny Lind group of mines to the mill, a distance of 1 1/2 mile, is completed. At the Chloride mine 130 men are at work and thirty stamps are dropping in the mill. R. A. Skinner, superintendent of the Glohe mine, started work this week. He will build a road from Dedrick to the hoarding house on Bear gulch. He has twenty men.

The Yellowstone G. M. Co. has been incorporated under the South Dakota laws to operate the Yellowstone mine on the east fork of North Fork Trinity river, near Coleridge; G. H. Gill, M. H. Gridley, F. C. Thomas, J. H. Gill of New York. Work has begun this week.

The Chonchilula Gold Reef M. Co. has been organized in New York to operate quartz claims in Chonchilula district, south of Douglas City. M. W. Musgrave, M. Manley, W. B. Heyburn, W. T. Wintemuts, P. M. Paulsen, S. T. Church and T. P. Estes are directors.

TUOLUMNE COUNTY.

B. B. Montgomery of Columbia last week bought a one-half interest in the

Nightingale quartz claim, 2 miles northwest of American Camp. J. G. Thoma of Arizona and A. W. Magel of Barmen, Germany, have bought the Temple gold quartz claim and the Barmen mine, near Sonora.

F. Foster and F. Berg are operating their 2-stamp mill on the Miner's Dream, near Groveland, which is run by a windmill. When the wind falls horse power is used, says the Carters New Era.

A double cylinder hoisting engine has been set up at the 700-foot station in the Harvard mine, near Jamestown, and sinking in No. 1 shaft resumed from that level to go down 200 feet.

W. S. Estey has bought the deep river gravel diggings of J. Woodside & Co.—the Wat Clark claim—in Springfield precinct, near Columbia, for \$75,000, says the Magnet. The pay channel has been opened up 50 feet wide and 6 feet deep.

The Cosmopolite mine, near Groveland, was sold last week to J. M. Merrill, who held a bond on it.

J. M. Meighan has begun operations at the Bourne mine, near Groveland, on the Divide, between the Cosmopolite and the Canonous mines. There is a shaft down 85 feet and a drift 110 feet. A new shaft will be sunk.

The Mexican group of mines near Groveland has been bonded to E. C. Hahn of Stockton. There is a shaft down 100 feet, the bottom showing a vein 4 feet wide of rock which mills \$7 per ton.

The Santa Ysabel Co., operating on the south end of Quartz Mt., near Stent, has reorganized as the Santa Ysabel M. Co. of Phoenix, Ariz. Directors—F. Tent, J. F. Macdonald, C. M. Flint, A. N. Parlin, S. Rothschild, R. C. Hayward, H. E. McIntyre, E. C. Loftus is superintendent.

The John Royal M. Co. has incorporated to work the John Royal mine, near Columbia. G. Christ, Jr., and A. G. Stark of Phoenix, Ariz., are directors and W. A. Holmes superintendent, says the Magnet.

YUBA COUNTY.

It is reported that a company of New York men, C. R. Hill manager, have bought placer ground covering 6 miles in length along both sides of the Yuba river below the restraining dam being built by the Government near Marysville. It is proposed to put in five dredgers to work this ground.

COLORADO.

ARAPAHOE COUNTY.

Operations are resumed by the Union Ore Extraction & Reduction Co. at Denver, having rebuilt their plant destroyed by fire last fall. Although not in full blast, they are treating thirty tons of copper-bearing ore daily, employing the Gardner process of extraction by leaching with sulphuric and other acids, says the Denver Post. P. W. McCaffrey is manager.

ARCHULETA COUNTY.

A. Bender of the Valley Seco Oil Land & Exploration Co., drilling 6 miles from Edith, says he struck a heavy flow of gas in a fine sandstone formation last week. This gives the company an abundance of fuel with which to operate its territory. The gas flow was opened at a depth of 2060 feet.

BOULDER COUNTY.

The Elkhorn Tunnel Co., near Wall Street, resumed work on the crosscut this week.

The Skandie mine, near Wall Street, has been unwatered and development resumed. Foreman Litzenberg says they will begin shipment of ore by May 1.

In the 10-foot shaft of the Argo claim, near Boulder, a vein carrying sylvanite is reported, averaging \$30 per ton. This claim is on the west side of the Buckhorn mine.

The Colorado Northern Co. has bought the Smoky Hill mine at Sugar Loaf. It will be worked extensively by the company, as they have a tunnel running towards it, which is in 2300 feet, and will cut it at 1400 feet in depth.

CLEAR CREEK COUNTY.

The St. Paul Co. are preparing for extensive operations on their group, which is a north extension of the Aliunde, near Silver Plume. A contract has been let for driving 200 feet of tunnel, and a number of leases have been let.

The East Argentine M. Co., owners of the Sidney tunnel being driven into Pendleton mountain in East Argentine district, near Silver Plume, propose to put in an air compressor and power plant this season. The machinery will be operated by water power under a 300-foot head.

Near the Jo Reynolds mine, near Lawson, Stannish & Co. have a lease and option on the Last Chance mine. Machinery will be put in and sinking resumed.

A. H. Colburn of Idaho Springs, owner of the Sporting Times group of six claims

on Independence mountain, near Georgetown, says work will be resumed next week. Work will be done mainly through the Moore tunnel, which is in 967 feet on the main vein, crossing the claims diagonally. Stopes will be opened every 100 feet.

At the Little Jack mine, near Georgetown, worked by the St. Paul Co., in 35 feet, the grade of the ore has changed from two ounces in silver to 200 ounces in silver, 15% lead and \$2.37 in gold per ton. C. Carpenter & Co. have taken a lease on the upper workings and are breaking ore which mills 200 ounces in silver per ton. They have a 6-inch streak. A terminal site has been located and a contract let to drive the tunnel ahead to cut this group of claims 1000 feet deeper than the present workings, says Manager Teagarden.

The Gem Co. resumed operations this week in the Newhouse tunnel, near Idaho Springs.

It is reported the Vulcan M. Co. will resume on their group, near Silver Plume, this month.

CHAFFEE COUNTY.

The Ohio & Colorado S. & R. Co. has opened a lime quarry at Maysville, near Salida. The preliminary work is complete, the ground ready to patent, and the quarry will be furnishing lime to the smelters here by the 15th. E. C. Kavanaugh is superintendent. It is estimated that at the present rate of consumption the saving to the company will amount to \$25 per day, aside from the fact of the ownership of their own quarry making the company independent in the matter of lime fluxes.

CUSTER COUNTY.

The Little Bernice G. M. Co. of Florence will build a matte smelter at its mine near Custer. The sinking of the shaft another 100 feet was begun last week.

DOLORES COUNTY.

Adams & Spurlock shipped three cars of high-grade ore from their lease on Nigger Baby hill, near Rico, last week. The ore is being taken from the mine to the railway on pack animals.

FREMONT COUNTY.

At Canon City, March 26, the main portion of the smelting works of the United States R. & R. Co. was destroyed by fire, the loss being \$200,000. The fire broke out in the refinery from an unknown cause; the plant is not a total loss as its entire value was \$800,000; 150 men are made idle. Manager C. M. MacNeill says the plant will be rebuilt, using brick and steel, and the capacity will be increased.

GILPIN COUNTY.

The Sydenham M., M. & L. Co. has a lease and bond on the Maine and Hamlet groups, near Central City, and have begun developments, with S. W. Brereton as superintendent.

GUNNISON COUNTY.

The Colorado S. & M. Co., A. E. Reynolds manager, is driving two tunnels, near Pitkin—one into Terrible mountain and one under the Mineral Farm basin. Both are in over 450 feet and are nearing the ore-bearing contacts. The Hall's gulch tunnel goes into the ground in which are the Maid of Athens and Citizen mines, both of which are producing regularly. The lower tunnel level on the Maid has struck the ore shoot opened in the upper workings.

The Ben Ezra, owned by R. R. Williams & Co. of Pitkin, is in a body of silver-lead ore. They have made shipments from the upper workings, but are driving a tunnel lower down to cut the ore deeper.

The Red Cloud mine, near Tin Cup, has 250 tons of ore sacked and ready for shipment, which averages \$58 per ton.

A. Lejune of the Blistered Horn Tunnel Co., operating on West Gold hill, near Tin Cup, says that, owing to the condition of the roads, no machinery will be placed in the tunnel until spring, but, in the mean time, hand drills will be used.

The Big Four group, near the head of Cement creek, near Crested Butte, will be operated extensively this season by the Tilden M. Co. of Chicago. A body of silver-lead ore has been opened up. The ore will be brought out by pack train to the Overstep siding.

After a shut down of a few weeks the Headlight M. Co. has resumed operations on its shaft. It is down 130 feet and will be sunk deeper before drifting is begun. Manager Ehlerding says a flow of water was struck which necessitated a pumping plant, which has been put in.

J. E. Berryhill, superintendent of the Davenport and Adair tunnels, near Vulcan, reports the Davenport tunnel in 1050 feet and has cut several large low-grade veins of gold ore. The Adair is in 430 feet, with the main vein still ahead 200 feet. When sufficient ore is opened a concentrating plant will be erected.

JEFFERSON COUNTY.

W. W. Bess, manager for the South Boulder Oil & Gas Co., reports that drilling has begun on its first well on the Wagoner ranch, in the Boulder oil basin, between Ralston and Coal creeks, 6 miles north of Golden. He says the company has 500 acres in the oil basin between the oil and coal horizons, the oil sand coming to the surface in the Dakota formation, 3 miles from the land on which this well is located and east from the coal. It is expected the oil sand will be reached at 1500 feet.

LAKE COUNTY.

The Louisville mine, near Leadville, has 1000 tons of ore on the dump which it started to ship last week, says Manager Hannifen. He does not expect to open up any large bodies of ore until the sulphide contact on the Cambrian quartzite is reached. The Ulster-Newton, also under Hannifen, has men at work. The shaft will be sunk another 100 feet.

The American S. & R. Co. has sold to A. Goodstein of Denver the Union smelter and the Bi-Metallic smelter at Leadville. They will be dismantled.

The Cloud City M. Co., near Leadville, have resumed. W. S. Jones is superintendent. Shipments of manganese iron ore were begun this week. The ore body is opened up at a depth of 460 feet. It is expected to begin other development work next week.

The Arkansas Valley smelter at Leadville has started in operation its automatic sulphide sampler, which has a capacity of 250 tons per day, and is built especially to handle low-grade sulphide ores. It is operated by continuous elevator belt passing along four cars at a time; ore is shoveled in the belt and is carried to the crusher; then it is sent through sizers, the coarse being returned to the roll. From the crushers and rolls the fine is taken through an automatic separator, where one-fifth of it is automatically taken out. This one-fifth is passed through another separator and one-fifth again cut out. The smelter is running full capacity, having eight furnaces in operation and handling 900 tons of ore per day, says Manager McDonald.

The Nisi Prius mine on Iron hill, near Leadville, has resumed, being worked by J. D. Murphy and M. Starne, and a good grade of iron is being shipped, which is coming from above the water level.

The increased output of the mines around Leadville during the last ten days of March brought the production of the district up to 2800 tons a day. Smelters are in the market for all the good iron ore they can get. To the production will be added another 100 tons by the opening of the manganese market by the Pueblo Steel Works, which contracted to start with 125 tons a day. This will come principally from the Sixth Street and Catalpa-Crescent mines.

MINERAL COUNTY.

W. H. Bryant of Denver, manager of the Humphreys mill, near Creede, says they have resumed, having been closed down since the early part of the winter, due to shortage of water. They are handling 350 tons of ore daily. It will treat all of the ore of the Big Kanawha M. Co.

OURAY COUNTY.

The Fowler smelter, 1 mile north of Ouray, opposite the Grand View mill, has been sold to the Ouray Chief M. Co. and Manager D. Woods says it will be ready to blow in by May 1. The smelter has a capacity of 100 tons per day.

SAN JUAN COUNTY.

The Astor M. Co. has organized at Silverton and has taken over the claims of the Sioux M. Co. and the Wigwam G. M. & M. Co., near the mouth of Picayune gulch. The new company will build a mill and will enlarge the power plant.

The Galty Boy group, in Dry gulch, near Gladstone, will be reopened and improvements made, work on which will be started this month. A tunnel has been driven on the group, opening up the vein with 300 feet depth which has been drifted on for 75 feet, the ore being 3 feet wide. This drift will be continued till it comes under the ore shoot, 350 feet ahead.

The Magnet mine, owned by D. J. Wells, near the Burro bridge near Silverton, will resume.

SAN MIGUEL COUNTY.

The Gazette says there are a few mills near Telluride which close down every winter because of the water supply freezing, resuming when the snow melts in the spring. Among those idle the past winter, and which will start up this month, are the Smuggler-Union and Tom Boy. One of the Smuggler-Union mills has been running steadily crushing 250 tons of mineral daily. The idle mill has a capacity of 200 tons and when it resumes it will be necessary to put 200 more men in the

Smuggler-Union mines. The new mill of the Tom Boy Co., handling ore from the Argentine and Cincinnati, has been steadily in operation since November 1, but the Tom Boy mill proper, capacity 225 tons daily, has been hung up since December 1.

J. McDonald and C. Trone of Telluride have a lease on the Santa Cruz mine, near Ophir, and have started development work.

SUMMIT COUNTY.

The Gold King mine in Clinton gulch, near Kokomo, is being worked and a mill will be built this spring.

The Miller group, 1 mile from the Little tunnel (the Klondyke), on Fletcher mountain, near Kokomo, will resume, says H. Miller, the owner. A mill will be built this spring.

V. E. Myer intends starting up the Aetna and Vesuvius gold mines on Fletcher mountain, and C. Anderson will open up the Peerless and Matchless.

TELLER COUNTY.

Operations are started on the Ajax claim of the Beacon Hill Ajax Co., on Beacon hill, Cripple Creek, by A. P. Gallagher & Co., who have a three years' lease. They will sink a two-compartment shaft to 500 feet before they do any extensive lateral work.

The directors of the Maggie G. M. Co. last week granted a lease on the north 500 feet of the Maggie claim on Bull hill, Cripple Creek, to Blair, Harris, Dickson & Crompton, for 2 years at 20% royalty, and the lessees are to sink the shaft an additional 150 feet. The shaft is down 300 feet, with crosscutting and drifting. The property adjoins the Gold Sovereign.

Work on the reduction plant being built by the Globe M. & R. Co. in Goldfield is progressing and it is expected the mill will be ready for operation by the 10th inst. It will have a capacity of 100 tons of ore per day. The company is putting in a steam plant of machinery at the mine.

The directors of the Golden Cycle Co. at Cripple Creek have closed the mine, due to the inability of the company to market the ore which is being mined. One of the directors stated that there are 15,000 tons of ore already broken down in the mine, running \$20 per ton. In addition to this amount, there are 500 tons of ore in transit.

The Cripple Creek M. Co., near Cripple Creek, has suspended work on the Giorietta shaft, and is working that block through the main shaft of the Hull City placer mine. Ore of a smelting grade, value \$40 per ton, is being shipped regularly.

Superintendent Taor of the Cripple Creek Gold Temple M. Co., leasing on the Gold Sovereign group at Cripple Creek, says the Fox vein has been opened up 150 feet south of the shaft, at a depth of 600 feet from the surface. The vein is 6 feet wide and carries free gold giving an average assay of \$32.

The Ophella tunnel, near Cripple Creek, will use electricity for lighting their entire workings; also a machine to operate a blower for ventilating purposes will be put in.

No leases have yet been granted by the executors of Stratton's Cripple Creek M. & Dev. Co. Owing to the suit now on trial at Colorado Springs and to the mill strike, the executors decided to postpone the granting of leases for the present.

J. L. Morris & Co. have a lease on the dump of the Ingham mine, at Cripple Creek, and they propose to build a cyanide plant this month.

It is reported the Electro-Chemical Ore Reduction Co., backed by Chicago men, will build a 300-ton mill at Victor next summer. C. Smedeker says a site for their mill has been bought near the Florence & Cripple Creek depot.

IDAHO.

BOISE COUNTY.

The concentrating mill at the Lincoln mine, near Pearl, J. T. Hodson, manager, is in operation. The plant has a capacity of 100 tons of ore a day and is operated by a 40 H. P. gasoline engine. The mine is developed to a depth of 300 feet, with 365 feet of drifts run on the ledge, which is 5 feet in width.

CUSTER COUNTY.

P. L. Fearn, consulting engineer of the White Knob copper mine at Mackay, says the company will blow in their smelter installed last season. It has a capacity of 900 tons a day. There are sixty men at work in the mine blocking out ore, which carries 3% copper and \$2 gold and silver. The shaft is down 700 feet, which connects with a tunnel 3000 feet long. The company has an electric railway 10 miles long connecting the mines with the smelter. It has a grade of 6% and carries a train of ten cars of five tons each.

The Haggan-Salisbury mine (the Ram's Horn), near Custer, has suspended operations.

GRAND COUNTY.

McCormick & Co. will start work April 10 on the Gold Coin group, east of the Tornado, on Gold Hill mountain, near Basin.

IDAHO COUNTY.

The two cleanups of the American Eagle mine at Elk City, owned by Spokane men, for the first half of March amounted to \$5700. In January the 10-stamp mill began operations and since that time \$23,000 has been produced. Superintendent R. M. Sherman says 14 feet of ore has been opened in the lower tunnel at the depth of 200 feet, showing values in gold.

The Bullion group of claims on the east slope of Thunder mountain, near Roosevelt, joining the Gold Eagle on the east, are reported sold to the company represented by D. McKenzie, for \$15,000. Development work will begin this month.

It is reported the Big Buffalo mine, near Hump in the Buffalo Hump district, will close down this month till the summer season, and they will equip the property with a 60-stamp mill, electric plant and a cyaniding plant.

JEFFERSON COUNTY.

The Montana Ore Purchasing Co., operating the Katie concentrator, near Basin, have had surveys made for a dam in which to discharge the slums from the mill, which heretofore have been dumped into Boulder creek. A flume is being built from the mill to the flat east of the concentrator.

OWYHEE COUNTY.

Electric drills have been put in operation at the Alta Vista mine, near Silver City.

INDIANA.

WARRICK COUNTY.

Porphyritic ore assaying \$40 gold is reported in the Snake Knobs mountains, near Lynnvill, on the Harrington farm, owned by C. Zimmerman. A shaft, a crosscut and a drift have been driven, opening up a 4-foot vein for 20 feet.

LOUISIANA.

CALCASIEU COUNTY.

In the oil field 3½ miles from Welsh fourteen derricks are up, of which nine are completed wells. Some of these came in as gushers, but are now pumping. Two wells on the Welsh Oil, L. & D. Co. were abandoned on account of the pressure of gas, which at the beginning of operations here was not understood, says the Record. The producing wells so far are Nos. 3 and 4 of the Welsh Oil, L. & D. Co., Nos. 1 and 2 of the Southern Pacific Co., and one each of the Southwestern Co. of Mobile, Ala., the Colorado & Texas Co., of Denver, Colo., the Metropolitan O. Co. of Mobile, Ala., the Hill Top Co. of New Orleans, La., and Lively & Brown of Beaumont, Tex. The present producing wells in this field average from 1000 to 1200 feet in depth.

MICHIGAN.

HOUGHTON COUNTY.

The directors of the Tamarack M. Co., operating near Calumet, submit the following report for the year ended Dec. 31, 1902:

Gross value of fine copper produced (15,961,528 pounds, at 11.87c).....\$1,894,320
Running expenses.....1,744,598
Construction expenses.....154,877

The rock coming from No. 5 shaft has not shown the copper contents expected. The amount of development work so far done, while quite extensive, is yet small in comparison to area of ground tributary to the shaft; but development will be increased as rapidly as possible. Meanwhile the reserves opened up in the past will still furnish ample rock of grade to maintain production.

Comparative results for 1902 and 1901:

	1902.	1901.
Tons rock mined....	837,568	773,783
Tons rock hoisted...	763,209	688,622
Tons rock stamped...	658,720	626,905
Pounds mineral obtained.....	25,747,931	29,998,094
Cost per pound at mine, exclusive of construction.....	9.51c	8.48c
Cost per pound construction.....	0.97c	1.56c
Cost per pound of smelting, etc.....	1.42c	1.63c

Total cost per pound refined copper....11.90c
Cost of stamping per ton of rock.....23.299c 24.953c

The principal construction expense for the year has been incurred for the purpose of completing the equipment work in No. 5 shaft. The mill has run steadily during the year.

The 45-drill compressor at the North

Kearsarge, at Calumet, went into regular service last week, furnishing air for the entire mine. The work of dismantling the two old compressors has begun and the 30-drill machine will be moved to the new compressor house. Six additional drills have been started at the South Kearsarge, making twelve drills in that part of the Osceola put on recently.

Baltic mineral, near Houghton, exclusive of stamp copper, is showing thirty-one pounds to the ton. Isle Royale for the past year shows 60 pounds of pure silver, 700 pounds half breeds (half copper and silver) and balance of silver up to \$8881 gathered from mineral cast into anodes and separated by electrolytic process at Perth Amboy, N. Y., from anodes shipped from Quincy smelting works.

MISSOURI.

JASPER COUNTY.

(Special Correspondence).—The rumored advance of lead concentrates to \$65 per ton has not materialized, the price remaining the same as the preceding week—\$58 50 per ton, delivered. The top price of zinc concentrates was, however, advanced one-half dollar per ton, two lots bringing \$41 per ton. The assay basis price for the best grades of ore was as high as \$37 per ton for ore assaying 60% metal, but considerable ore sold on a basis of \$36, and some even less, during the forepart of the week. Although the sales for the first twelve weeks of this year were 6599 tons of zinc and 1179 tons of lead less than the first twelve weeks of last year, the value is greater by \$12,929—the effect of higher price for both zinc and lead this year. A year ago zinc sold at \$34 per ton, and lead is \$15 per ton higher than this time last year. The following is the sale of ore from the Joplin district for the week ending March 21:

	Pounds.	Value.
Zinc.....	20,256,540	\$176,390
Lead.....	903,310	27,424

Total.....\$203,814

The following is the sale of ore for twelve weeks:

Zinc.....	105,963,970	\$1,678,947
Lead.....	12,069,680	319,268

Total.....\$1,998,215

Joplin, March 28.

MONTANA.

BEAVERHEAD COUNTY.

From the Ajax mine, near Dillon, owned by A. J. Noyes and J. E. Morse, was shipped last week two bars of gold bullion, value \$2500, the result of twenty-two days run of the mill. The mill is 4500 feet from the mine and the ore is hauled over a wagon road. It is intended to put in five more stamps and other machinery this spring. Assayer T. B. Landers tells the Dillon Tribune that during this winter the ore worked has averaged \$125 a day on the plates and the concentrates will go 25% lead, 7 ounces in silver and \$25 in gold. The ore averages \$10 a ton. W. B. Stanchfield is superintendent and has twenty-five men at work.

CHOTEAU COUNTY.

A. G. Staten reports finding anthracite coal 10 miles south of Havre. The vein stands vertical, is 4 feet thick and strikes into one of the peaks in the chain of Bear Paw mountains.

DEER LODGE COUNTY.

At Anaconda the Amalgamated C. Co. has several hundred men at work on the smelter excavation and foundation for the flue which is being put in place at the Washoe smelter. The stack will be on one of the highest peaks near the works, and it is proposed that the smoke, fumes and other poisonous substances from the furnaces will be conveyed to it by means of a flue built along the mountain. By this it is expected the fumes will be carried to such a height that they will not settle and destroy the vegetation.

FERGUS COUNTY.

J. W. B. Parry of Denver, Colo., has bought the Gudgell group of five claims in the North Moccasins, near Lewistown, and will begin development work next week.

LEWIS AND CLARKE COUNTY.

The mill of the Big Indian M. Co., 4 miles south of Helena, has sixty stamps dropping. It is the intention of the owners to enlarge the mill.

The New World M. & D. Co. has been incorporated at Helena by B. B. Kelly, D. Boyd et al.

The Butte & St. Paul M. Co., incorporated under the laws of Arizona, filed its articles at Butte last week; F. H. Pilling, J. P. Hansen, C. J. Smith.

The Sullivan M. Co. have secured \$100,000 for the completion of their smelter at

Marysville, says Manager Finley, and it is intended to begin operations at the mine this month.

P. Solaro, from the Mary Aloys mine, near Rimini, is taking out ore from an 8 inch streak, and a former shipment gives returns of 110 ounces silver and 34% lead.

Operations were resumed at the cyanide plant of the Montana M. Co., at Marysville, this week.

MADISON COUNTY.

W. Parker, manager of the Maggie Gibson dredger, operating near Virginia City, has men at work overhauling the machinery preparatory to the summer's work. They have a lease on the placer ground of the Conrey Co.

H. Lloyd, who, with J. D. Land and R. T. Smith, is developing the Gold Bug mine, 4 miles from Pony, says shipments will begin next month. The snow is deeper in the mountains this spring than it has been for many years past, assuring plenty of water for mining and milling purposes this season. In the Ben Harrison mine, owned by Lloyd, he says free-milling gold ore has been opened, and a 5-stamp mill will be built this summer.

The Pony Sentinel says work was resumed on the Clipper-Boss Tweed group of mines near Pony last week. In addition to the work on the Boss Tweed mine, the Clipper will be further developed, both of which mines can be ultimately operated from the workings now under way. A tramway from the mine to the mill, in a direct line 2.1 miles, will be built next month and the 100-stamp mill completed. A. C. Carson is superintendent.

MISSOULA COUNTY.

The coal deposits near Missoula are to be developed this season by the Missoula Coal Co., organized last week by Missoula and Lincoln, Neb., men. It is proposed to begin operations on the coal that has been opened on the Richili ranch, 2 miles northwest of Missoula.

Since the recent strike of 8 feet of concentrating galena on the Tarbox, 3 miles from Selteese, the company has decided to erect a 100-ton concentrator the coming summer. The company own a millsite below the mouth of the working tunnel and a water right. Average assays made last week gave 27% lead. The ore was taken out 250 feet below the surface. R. Dixon of Wallace, Idaho, is president and manager.

SILVER BOW COUNTY.

Manager Buckley of the Travona mine of Butte has in twenty-eight shifts driven a drift 310 feet, the men working eight-hour shifts, says the Inter-Mountain.

The Butte M. & D. Co. will develop the Emma mine to 1200 feet. At 800 feet the lead shows 2% copper, 20% lead, twenty ounces silver and two ounces gold. In the upper portions of the mineral zones of Butte lead, silver and gold values predominate, but with depth copper appears.

NEVADA.

ELKO COUNTY.

Machinery for the mill at the Latham mine, near Wells, is on the ground.

HUMBOLDT COUNTY.

The Arizona mine, operated at Unionville, by the California-Nevada M. Co., has been shut down.

LINCOLN COUNTY.

The Nevada Keystone M. Co. in Yellow Pine district has started up its mill at Sandy and is handling twenty tons a day. The mill had been closed down since Dec. 15 last, during which time improvements were made in the mill and around the mine, including the addition of a hoisting plant.

At the Cyrus Noble mine, near Searchlight, an upraise is being driven from the 100-foot level north drift to the surface. Sinking in the main shaft is down 170 feet.

NYE COUNTY.

E. Hirschler of San Francisco, Cal., has bought the Osborn group of eight claims at Lone mountain, the Johnson group of eight claims at Gold mountain and the Estell group of six claims, 1½ mile south of Butler, for \$13,000.

J. C. Griffin reports gold quartz found on the south end of the Cutting & Griffin group, near Butler. The ledge is 4 feet wide on the surface. The eleven southern claims of this group have been incorporated as the Minetta M. Co.

A strike is reported made in the Fraction mine at Butler, on the south drift of the 400-foot level, showing a 9-foot ledge which averages \$100 a ton. The winze on the 300-foot level has cut a ledge 4 feet in thickness that averages \$80.

D. G. Doubleday of San Francisco, Cal., has bought the Moonshine and Blue Forge claims, on the same ledge as the Newhouse mine, at Hannapah, near Butler, and the Hannapah Mutual M. Co. of

San Francisco has been formed to work the group.

F. W. Johnson has bought the Pequot group of six claims on the southwest slope of Lone mountain, 11 miles from Butler. A ledge 2 feet in width and carrying values of \$60, with a percentage of copper, has been opened up.

STOREY COUNTY.

The Enterprise says one shift has been laid off at the Butters cyanide plant in Six-mile canyon, near Virginia City, and the system of working changed. The company made a cleanup of \$40,000 last week, the tailings, after leaving the tanks, assaying 25 cents a ton. Changes will be made in the method of delivering the tailings to the tanks whereby three men and four horses will do the work of forty-five men.

The three Reldler pumps placed on the 2150-foot level in the Con. Cal. & Va. shaft at Virginia City were put in operation on the 28th ult. and measurements showed that in an hour's run the water was lowered 10 feet. They are run by electricity. The 16-inch shaft of the main hoisting engine at the C. & C. shaft was found to be fractured, and until replaced all underground work except that required about the pumps will be suspended, putting 100 men temporarily out of work.

WASHOE COUNTY.

H. Olinghouse shipped a gold bar of \$3300 value last week, the result of milling 125 tons of ore from the Gold Center mine in Olinghouse canyon, near Wadsworth, says the Journal. He has taken up the bond for \$8000 which he has held on the Gold Center.

WHITE PINE COUNTY.

J. R. Leask, superintending the erection of smelting works at Keystone, near Ely, for the New York & Nevada C. Co., received a telegram from the East last week ordering all work stopped and the discharge of all employees, pending the arrival there of J. P. Evans, when the location may be moved.

At Cherry Creek P. H. Cannon & Co. will put up a 20-stamp mill. They have bought the Exchequer mine. The mine was never operated below the water level, but it is known that rich ore exists at that point, says the Reno Journal. This mine is near the Star mine, owned by the Glasgow & Western Exploration Co.

NEW MEXICO.

COLFAX COUNTY.

At Baldy, A. W. Ward has men at work on the Aztec mine, which is equipped with a 40-stamp mill.

On Aztec hill J. James is opening up and blocking out ore on the Rosita. In places the lead is 12 feet wide.

A. Monroe has a lease on the Black Horse group. He is taking out ore and crushing it in the 10-stamp mill.

Work has been resumed on the Thelma. The milling plant, including a cyanide outfit that will treat twenty tons of ore daily, is in operation. The parties in charge of the Thelma are also developing the Montezuma. It is proposed to consolidate the Thelma and the Montezuma interests.

GRANT COUNTY.

The Jack Doyle lead carbonate claim, 5 miles south of Stein's Pass, has been sold to W. Morris. A shaft is down 50 feet, at which point the vein is 2 feet wide, running 30% lead.

At Stein's Pass, the Beck mine of the National G. & S. M. Co. has put men at work. A boiler, pump and hoisting machinery are being put in.

Men are at work on the McKinley mine, at Burros, sinking the shaft. The first shipment will be made April 15. The McKinley is an extension of the St. Louis vein and is owned by R. P. Thompson and O. J. Westlake.

C. R. Smith, superintendent and manager Wilson M. & M. Co., at Stein's Pass, says the 10-stamp mill is being overhauled and a hoist is being put in on the Volcano mine. The ore carries gold and silver, averaging \$9 gold a ton, and is free-milling. Pan amalgamation is used.

LUNA COUNTY.

The Tres Hermanos G. M. Co., of Boston, has bought the Yellow Jacket mine at Tres Hermanos and machinery will be placed. The company has located two other claims, a total of forty acres, adjoining the Yellow Jacket.

OTERO COUNTY.

W. H. Price and A. C. Kerr of the Jarilla C. Co., near Jarilla, says development work will be resumed and shipments begun next month.

SOCORRO COUNTY.

The New Mexican says the F. A. Jones iron mines, at the north end of Oscura mountains, southeast of Socorro, have

been sold to the Colorado Fuel & Iron Co. The ore is hematite, running 40% iron. They are 17 miles west of the El Paso & Rock Island Railway and 30 miles south-east of Progresso, Torrance county. Foundries and rolling mills will be erected. Coal can be obtained from Clark, in this county, or Dawson, in Colfax county.

A 50 stamp mill and a cyanide plant are in process of erection by the Socorro G. M. Co. in Cat Mountain district, near Socorro. Four shafts and much tunnel work has been done on the group. It is claimed the ore will average \$18 per ton. It will be carried to the mill by tramway.

OREGON.

BAKER COUNTY.

The North American G. M. Co. of Seattle, Wash., have sunk a shaft on their Porcupine mine, near Sumpter, to a depth of 100 feet. The ore shoot is showing 18 inches wide, assaying \$16. It is proposed to put in a compressor and power drills and drive a crosscut tunnel 1200 feet to cut the ledge at a depth of 800 feet. The plant will be built below the present workings, on Wind creek.

On the Gold Bug-Grizzly group of ten claims in Ibex district, near Sumpter, controlled by Eastern men, development work will begin next week, says Manager J. J. Hennessey. The group adjoins the Ibex on the west.

The Golden Wizard Co. are preparing to erect a mill on their group, near Sumpter, this summer, says Superintendent J. M. McPhee. It is proposed to put in a plant of 100 tons daily capacity.

F. P. Schultz of Milwaukee, Wis., president of the Old Abe mine, in Minersville district, near Baker City, says two 80 H. P. boilers, a 6-drill compressor, a double-cylinder 9x14 hoist and a sinking pump with a capacity of 350 gallons a minute are to be put in. In addition to this the company propose to install a mill and cyanide plant in the fall capable of handling 200 tons of ore a day. They have 600 feet of development work done. Cross-cutting has advanced 105 feet and is still in ledge matter. Average samples assay \$3.81. The ore contains neither chalcocite nor galena.

All the machinery for the Sumpter smelter at Sumpter is on the ground and is expected to blow in by May 1. The lime quarry has been opened up. A reservoir is being built on the hill above the smelter. The Sumpter Valley railroad will build yards and switches running to the smelter.

The Gold Pan M. Co., near Sumpter, say a hoist will be erected this spring, capable of sinking 500 feet. The group has been developed by a series of tunnels and shows high-grade ore. The Geiser-Hendryx Co., which has the management of the Gold Pan group, will also install a sinking plant at the Midway Con. group.

DOUGLAS COUNTY.

The Flamm mine, on Hogem creek, a tributary of Starveout, near Glendale, is reported sold to A. Scott of Chicago, Ill., for \$12,000.

PENNSYLVANIA.

SOMERSET COUNTY.

The Berwind White Co. of Windber, employing 4000 miners, has posted a notice of an advance of wages to machine miners of 12%.

SOUTH DAKOTA.

CUSTER COUNTY.

(Special Correspondence)—The Crown mica mine, 3 miles northwest of Custer, is preparing for a good season's shipment. This mine has shipped over \$300,000 worth of mica, the last shipment being about ten carloads in 1901-02. It is intended to make large shipments during the present year. D. H. Hault is superintendent.

Custer, March 30.

LAWRENCE COUNTY.

The shaft house of the Hidden Fortune Co. on the Bingham mine, Poorman gulch, near Lead City, which was burned on the 25th ult., will be rebuilt. This shaft is sunk on the large ledge of the Bingham which is found in the schists. Overlying the schists is a sedimentary formation which also carries ore, and which will supply the new mill recently completed below Deadwood, says Secretary G. D. Begole.

The Minerva mill in Blacktail gulch, near Central City, has been reconstructed and will be operated as a cyanide mill. The mine has considerable development, and will produce 150 tons daily.

A strike of good ore is reported in the Cleopatra mine in Squaw Creek canyon, near Cold creek, in the lower quartzite of the Cambrian. There are values in this vicinity in both the upper and lower quartzite and overlying limestone.

The Hidden Fortune M. Co. will rebuild their hoisting works, near Deadwood, which were burned down last week. The

plans call for a shaft house and hoisting machinery (capacity 1000 feet), electric light and power plant and carpenter shop. W. R. Dickinson and N. R. Treweek are local directors.

Articles of incorporation were filed last week by the Homestake Belt G. M. Co. of Deadwood, and also the Burlington M. Co. at Deadwood.

The Gladiator M. Co., near Deadwood, is putting in an air plant, consisting of a 100 H. P. boiler and an air compressor, as well as a pump and a double-cylinder, friction-gear drum hoist.

PENNINGTON COUNTY.

(Special Correspondence)—The Cochran mine, near Rochford, is reported being negotiated, the Black Hills Copper Co. being the prospective purchasers. The mine was discovered in 1878, and was known as the Jenny Lind. It was sold to a corporation known as the Alta-Lodi Co. They built a 40-stamp mill, and after a brief existence the mine was closed and the mill removed to the Look-out mine, on Castle creek. J. Cochrane relocated the mine after several years, did a little development and opened a good-sized vein of \$15 gold rock, which he worked in a Huntington mill. He sold the property, after taking out a large amount of money, for \$25,000. The new owners did not make a success of it, and Cochrane again came into possession of the mine, which he has reopened and is now selling again.

Rochford, March 26.

The Holy Terror mine at Keystone is now down 1200 feet and is the deepest mine in the Black Hills. The vein is composed of crystallized quartz containing free gold with pyrite and arsenical iron sulphide. The vein produced a large amount of gold in its upper working and then became poor, though the vein continued uninterrupted. Exploration was continued in depth and a new pay shoot discovered, which has continued to the lowest levels thus far opened. R. B. Hughes is superintendent.

E. L. Hurlbut, secretary of the Rapid City Light & Fuel Co., says they will begin boring for oil near Rapid City the coming season.

The Sunbeam, near Redfern, is down 240 feet with its shaft, at which depth a station is being cut. Machinery for a 10-stamp mill is on the ground. The ledge has widened from 1 foot at the top to 8 feet at 240 feet, and shows an average assay value of \$100 per ton, says the Black Hills Review.

The Servian-American G. M. & M. Co., operating in Oro district, owns 500 acres of ground 2½ miles east of Redfern, adjoining the Sunbeam. The ore bodies run 5 feet wide, with values of \$10 per ton in gold, free-milling, and concentrates have been obtained giving an assay value of \$55 per ton. On one of the ledges a 50-foot shaft has been sunk on a 3-foot quartz ledge which shows an average value of \$15 per ton. Manager Stankovitch says a 10-stamp mill will be built.

UTAH.

BEAVER COUNTY.

A group of ten claims adjoining the Montreal and Old Hickory in Rocky district, near Milford, has been sold to a Salt Lake syndicate, J. C. Stewart manager, for \$25,000. A 70-foot shaft has been sunk.

GRAND COUNTY.

Manager Clark, owner of the Clark group of claims at Gold Basin, La Sal mountains, will put up a 100-ton cyaniding mill this month. There are 1500 feet of development work done on the group.

JUAB COUNTY.

The Mona mill at Mona resumed this week.

F. L. Wilson of the Lucy L. mine of Deep Creek district, near Fish Springs, says work has resumed.

PIUTE COUNTY.

S. F. Mount has a bond and lease on the L. & N. group, south of Gold Mountain district, near Marysvale. About 500 feet of work has been done on the group, including open cuts, shaft and tunnel. The shaft is on the south border of the 300-foot lode, which averages \$4 gold a ton.

SALT LAKE COUNTY.

The Bingham Bulletin says the Boston Con. C. Co. instead of depending on an extension of the Copper Belt railroad will build an aerial tramway to the Rio Grande Western depot, paralleling the Highland Boy tramway. The survey has been made.

Manager Wall has started development work at the Kempton mine at Bingham.

Manager T. Jacobson of the Columbus Con. mine of Alta, says it is proposed to erect a concentrating plant at the mine and to put in an electric power plant in Little Cottonwood canyon, to generate

power and light for use of all the mines of the camp which may choose to contract for such.

The Dewey mill at Bingham will resume.

SUMMIT COUNTY.

Articles of incorporation of the Avondale M. Co. were filed last week; L. Moore of Cincinnati, Ohio; D. S. Taggart, E. W. Wilson and C. E. Hudson, Salt Lake City. Their claims adjoin the Naildriver at Park City.

Superintendent C. L. Rood of the Naildriver, at Park City, says the galloways-frame is in position and the engine is being set up. It is expected to resume sinking by the 25th inst.

TOOELE COUNTY.

It is reported that the Mono mill in Dry canyon, near Ophir, will resume.

UTAH COUNTY.

The Colton Wax M. & Oil Co., principal office at Milwaukee, Wis., has been incorporated by T. J. Pringle, B. Hauser, P. Auschuetz and J. C. Grieb, to transact a general mining business, including boring for oil and refining petroleum and oil. The company owns wax claims near Colton.

WASHINGTON.

OKANOGAN COUNTY.

The Prospector says the Copper World mine, near Loomis, is under option to Eastern men, with W. B. Moore manager.

SNOHOMISH COUNTY.

The Imperial M. Co. of Marysville resumed work on the Imperial group, near Silverton, last week. M. Swinnerton is superintendent.

WYOMING.

BIGHORN COUNTY.

The Cody Oil & D. Co. will begin drilling its first oil well near Cody May 1st.

CARBON COUNTY.

It is expected that the reduction plant of the North American Copper Co. at Grand Encampment will be in operation May 1st. At the concentrator the machinery is all in place. The roaster building above the smelter is completed. At the smelter the additions consist of a 300-ton blast furnace, two converters, mud mill, twenty-ton crane. At the sampler a 50 H. P. motor has been put in to be used instead of the steam engine. A 4-foot 4-mile pipe line, to convey water from the Encampment river to the power house, is being built.—At the Ferris-Haggerty mine of the company development work continues and Superintendent Bunce says they will supply the smelter with 200 tons of ore per day. An aerial tramway has been put up.

CROOK COUNTY.

North and east of Moorcroft, in the southern part of this county, there are six companies, besides other parties operating in the oil fields. The Butte Crude Petroleum Co., of Montana men, H. Albertson of Butte, manager, have a well down, and are in red sandstone. Last season the Nebraska O. & A. Co., H. Rathbun of McCook, Neb., president, put a well down 1500 feet, on which work will resume this spring, and another well will be started. Drilling will be begun May 1st by the Senate A. & O. Co., W. B. Hunt of Winchester, Ind., president. They control 1600 acres, both as an oil and an asphalt proposition.

FOREIGN.

AFRICA.

RHODESIA.

The Rhodesia Chamber of Mines reports production for January, 1903:

	Ozs.	Dwts.	Value.
From mill.....	13,400	1.87	£48,508
From tailings.....	2,606	17.52	7,916
From other sources.	237	11.90	861
Totals	16,244	11.29	£57,285

AUSTRALIA.

QUEENSLAND.

The recently discovered lode in the 750-foot level in the Mount Morgan mine has been followed 140 feet. For 110 feet the average of the assays shows one ounce per ton; but the last 30 feet shows poorer values. It is believed the ore in that part will not average more than five pennyweight. The opening of this lode is being watched by owners of gold leases adjoining the Mount Morgan, as it is considered possible the lode will extend for considerable length, says the London Mining Journal.

At Gladstone it is reported that men in the Dawes mountains, 60 miles from Gladstone, have discovered a large body of

ironstone which is auriferous. Samples yielded as high as five ounces of gold per ton. Large numbers of miners are flocking to the ground, and already three miles of leases have been pegged.

At Wolfram camp most of the wolfram mines are yielding fine molybdenite, which is selling for £170 per ton on the field. The mineral occurs in vugs associated with wolfram and bismuth and has to be separated by hand picking. Some of the claims have large outputs and are yielding good profits. The camp is on the upper waters of the Walsh river, and 14 miles from Dimboola.

VICTORIA.

Pay copper ore in quantity has been found near Buchan, in Gippsland. The necessary fluxes abound. Trial samples in bulk have been sent to New South Wales Metallurgical Works for treatment, says the Standard.

WESTERN AUSTRALIA.

The Mining Standard reports Kalgoorlie January crushings include: Ivanhoe battery treated 12,052 tons for 4590 ounces, cyanided 6710 tons for 2012 ounces, slimes 4722 tons for 1588 ounces, telluride 348 tons for 463 ounces, concentrates 620 tons for 1958 ounces. Total, 12,400 tons for 10,611 ounces fine gold, valued at £45,043. The Hainault crushed 860 tons for 490 ounces, valued at 77s 10½d per ton. Brown Hill Extended treated 2041 tons of sulpho-telluride ore at Hannan's Star Ditch plant for 5115 ounces. Kalguril treated 3630 tons for 3441 ounces 19 pennyweight of gold of standard fineness. Hannan's Reward and Mount Charlotte crushed 400 tons for 338 ounces, valued at 76s per ounce; Hannan's North, 412 tons for 149 ounces 10 pennyweight, valued at 76s per ounce.

Kalgoorlie mines have been connected with the temporary pipe line from the Mount Charlotte reservoir until such time as a permanent and larger pipe line is laid down. The price at which the water is being sold to the mining companies is nearly £1 per 1000 gallons less than the cost of condensed water. At the Great Boulder, where 20,000 gallons of that class of water is used daily, a reduction of about 1s 6d per ton of ore treated will now be made.

BRITISH COLUMBIA.

The Wakefield mines at Silverton, in the Slokan, will start up May 1, and its concentrator will be put in shape to run on the reserves of ore that were blocked out last season.

The Minnesota Silver Co.'s mill, near Slokan City, has started on Ivanhoe ore. There are twenty men at work at the mines.

At the Kootenay mine, near Rossland, machine drills have been added to the equipment, making five in operation on the third and fourth levels.

The Yreka C. Co. at Quatsino is making additions to its plant at Quatsino, says Manager W. C. Spicer. They will also put up a sawmill on the water front, capacity 10,000 feet a day. The company is shipping 3500 tons of ore per month.

W. J. Robinson of Philadelphia, Pa., manager of an Eastern company, has bought the Ophir group of hydraulic leases, containing 200 acres, near Atlin, for \$35,000. They will exploit this ground by means of prospecting drills preparatory to putting in a dredger.

The members of the Stevedyke Hydraulic M. Partnership, Ltd., at Atlin, have decided to consolidate their holdings and incorporate as the Stevedyke Con. G. Fields, Ltd.

During the strike of the coal miners in East Kootenay, shutting off the coke supplies of Boundary smelters, which has now lasted seven weeks, the Granby and the Snowshoe companies, in Phoenix camp, were about the only ones in Boundary that kept steadily at work. Up to a few days ago the Snowshoe was shipping, but was forced to discontinue when the Sunset smelter at Boundary Falls ran out of coke. However, the miners are still at work at the Snowshoe and ore is being blocked out in larger quantities. At the Granby mines Superintendent Williams kept a large number of men at work during March, but they are now being somewhat reduced. But two furnaces at the smelter are in blast. This cuts the ore shipments down to 750 tons daily. In the meantime ore has been broken down in both the Knob Hill and Old Ironsides mines, in preparation for resuming shipments on the 1500 tons per day basis. The smelter's ore bins are full, as well as those at the mines, making a combined tonnage of 30,000 tons. In the Knob Hill the workings are so filled with ore that work on the property, except in the upper glory hole workings, has had to be temporarily suspended. At the smelter they have been dependent entirely on the limited supply of coke that is coming in from the Vancouver Island collieries.

CANADA.

NOVA SCOTIA.

The Boston News says Halifax advices report that the fire in Dominion No. 1 colliery at Glace Bay is increasing. Men are working with brick and mortar to dam the fire within an area of 200 yards square. When this is finished that section will be flooded and if the dams hold and no explosion occurs the mine will likely be saved, but the loss to date is serious.

INDIA.

Manganese is being mined at several places in India, and is being very largely railed from Tharsa and Kampti stations on the Bengal-Nagpur Railway, in the Central Province, says the Mining Standard. In both cases the ore is carted from Ramtek, from 12 to 15 miles north of these stations. Recently good ore has been found near Balaghat, on the southern section of the Satpura Railway, and it has been decided to run a branch to the mines by the Bengal-Nagpur Railway.

KLONDIKE.

Twenty-seven Klondike claims, comprising 1½ mile of Gold Run creek, near Dawson, have been sold for \$2,000,000 to a syndicate of London and Paris men, who have incorporated the Gold Run M. Co. A. E. Willis is manager, with headquarters in London. Most of the ground included in the deal comprises consecutive claims, permitting its operation by hydraulic methods on a large scale.

NEW ZEALAND.

The Wahi mine has paid nearly \$5,000,000 in dividends and interest. The value of the hulkion to Jan. 1, 1903, was \$12,132,134.65, all of this amount, except \$467,079.25, having been obtained during the past ten years.

MEXICO.

CHIHUAHUA.

The Guggenheims started up the other two units of their concentrating mill at Santa Barbara this week, making the capacity 450 tons daily. Only one unit of 150 tons daily has been used since the plant started up a few months ago, owing to a shortage of water.

Manager J. R. Harbottle of the Guazapares M. & M. Co., operating at Guazapares, says men have been scarce to operate the mine this season. Their 50-ton lixiviation plant is in operation.

The tunnel of the Josephina mine at Cusihuiriachic is in 150 feet on a 300-foot contract. Shipping ore is being taken out carrying values in gold, silver and lead. It is the intention to extend this tunnel 1000 feet. The vein is 15 feet wide and a 1000-foot tunnel will give a depth of 700 feet.

At Santa Eulalia last week C. A. Aiken and D. Jackson of San Francisco, Cal., were given an option on seven mines aggregating 115 pertenencias, and work will begin this month. The group includes the Buena Tierra, San Antonio, La Carolina, La Fortuna and Nueva Santa Eulalia.

Roasters are being put in at the Red Hill mine, near Chihuahua. The process heretofore has been pan amalgamation only.

Electric drills are in operation at the San Francisco del Oro mines, near Santa Barbara. The Montezuma Lead Co. at Santa Barbara is working on 4200 pertenencias of mineral ground.

A. L. Rossen and A. B. Callender have had to stop work in their Maria mine at Parral and will put in pumps and drilling machinery.

E. J. De Witt has a bond and lease on the St. Augustine mine, south of the Santa Fe mine, near Parral. He is down 110 feet and has ore which he will cross-cut at the 150-foot level. At 55 feet he struck native silver.

OAXACA.

P. Gram has a sixty-day option for \$320,000 on a gold and silver group 8 miles south from Etzatlan.

G. D. Truth and M. B. Katze have an option on a petroleum prospect 6 miles from Etzatlan and 2 miles from the railroad for \$125,000. Development work will begin next week.

F. W. Harrell has bought the Candelaria, Patrocina and San Pedro mines, 6 miles from Etzatlan. They carry gold and silver.

Near Oaxaca, La Escudra group of mines has been sold to an American company (La Escudra M. Co.), who will put in machinery.

SONORA.

(Special Correspondence).—The La Dura M. & M. Co., operating the Prietas mine, are doing development work in the central shaft, down 800 feet, and will sink to 950 feet. When connections are made

with the north shaft, all the ore will be taken out through the central shaft, which has double compartments, equipped with cages, double-drum hoist and air compressor. Air drills are used. The first-class ore is packed to the railroad, about 100 miles distant, for shipment to the smelter. The second-class ore is taken to the mill for treatment. The Gloria mine, which the above company is operating, has an incline shaft over 1000 feet deep, taking out about 200 tons per month. The ore is handled the same as the ore from the Prietas. The Gloria is 1 mile from the mill and the Prietas 2½ miles distant. The ore goes through crushers and revolving screens to jigs and tables. They have twelve jigs in use and two round tables. The ore is rich in silver. P. Schabrum is superintendent, A. S. Graff assistant superintendent.

La Dura, March 18.

(Special Correspondence).—The Bufo M. & S. Co., at Bufo, is putting in a concentrating plant and reverberatory furnaces and will ship high-grade matte instead of concentrates. At present they are working the ore by the lixiviation process. The high-grade ore is shipped without concentrating. At present they are developing the Bufo property. The company has been in operation the past five years and has paid all expenses from the mine. They are 160 miles from the nearest shipping point. Everything is packed in and all ore packed out. The company is putting in a pumping plant. D. Richardson is president, F. Richardson secretary, W. Richardson general manager, E. George acting superintendent, E. M. Clark metallurgist.

La Bufo, March 19.

(Special Correspondence).—Los Coches mine, at Los Coches, has one shaft down 120 feet, one 84 feet and one 70 feet. The vein is from 5 to 8 feet wide. The ore is quartz carrying gold and silver, averaging \$15 per ton. They have a steam hoist, pump, etc., on the property. They will erect a 20-stamp mill. W. J. Burdick is superintendent.

Los Coches.

(Special Correspondence).—The Yaqui S. & R. Co. is erecting a 125-ton custom smelter and refinery at Toledo, a new camp on the Yaqui river at San Antonio, 90 miles east of Torres. The smelter site is on the west bank of the river, in the heart of a rich mining section, and within 6 miles of coke and anthracite coal mines. Water will be supplied from the river. Foundations for the plant are completed and machinery is arriving. The machinery is being furnished by the Allis-Chalmers Co. of Chicago, Ill., and will consist of one 100x36-inch and one 36-inch circular blast furnace, softening and calcining furnaces, Howard zinc stirring machine, etc. All furnaces are supplied with blast from the main blast pipe line. This is provided for burning native anthracite coal. They expect to be in operation within six months. The company owns mines carrying lead, silver and gold. Many properties in the district, too low grade to ship out of the country, are waiting the completion of the smelter, when they will commence active operations. This is the first custom plant of its kind in Sonora. A. E. Klausner is president, J. R. Moorman secretary, H. C. Gerber constructing engineer, F. Davis general manager.

Camp Toledo, San Antonio, March 20.

(Special Correspondence).—The Sunset Development Co. is operating the coal mines at La Barranca, where they have anthracite coal and coke. At present they are supplying the surrounding camps with coal and will furnish the smelter, when completed, at Camp Toledo. They are putting in coal sheds and also intend putting in a chain hoist. H. M. Martin is superintendent.

B. A. Ogden, superintendent of the Las Gateras mine, La Barranca, reports a strike of ore that runs high in silver and 7 ounces in gold.

La Barranca, March 21.

(Special Correspondence).—According to the old records, the Jesuits and Indians took \$4,000,000 out of the Mina Blanca, now owned and operated by La Sonora G. & S. M. Co., at Sauqui Grande, who will erect a concentrating mill and, possibly, a smelter. This mine was worked as early as 1710, and has 4000 feet of tunnels and shafts and a dump of 30,000 tons left by the early workers. The new work was started in November, 1900, and consists of 1200 feet of tunnels and shafts, which cut under the old workings 160 feet. The vein is 16 feet wide, all concentrating and smelting ore, running in silver, copper, gold and lead. They have erected their engine and shaft houses, hoist, etc., and can ship ore at any time. The property consists of seventy-eight acres. Ortiz is the shipping station. J. D. McArde of Minneapolis, Minn., is president, C. E. Wenzel vice-president, F. W. Webster treasurer, F. Chambers secretary, T. F.

Collins superintendent, F. E. Dickinson general manager.

Sauqui Grande, March 20.

In the Yecora district, and near the Chihuahua boundary, a vein of silver ore has been found and is being worked by the Colon M. Co., organized by Chihuahua men.

The El Tigre mine, south of Douglas, Ariz., has been sold to a company of Kansas City, El Paso and Bisbee men for \$650,000 gold. The company has organized as the Lucky Tiger-Combination G. M. Co., with B. F. Graham of Bisbee, Ariz., president, F. M. Sturges of El Paso, Tex., vice-president and manager, and W. J. Morse superintendent. Machinery will be put in and extensive operations begun.

* PERSONAL *

C. F. MAUNDER is superintendent Liberty mines, near Butler, Nev.

J. P. EVANS of the Colorado Iron Works Co. is in Ely, Nevada.

P. G. SAWYER of Kansas City, Mo., is in Douglas, Ariz., on mining business.

J. HOAG of Denver, Colo., has charge of a property at La Dura, Sonora, Mexico.

J. D. DEBEQUE of Santa Eulalia, Mexico, is in Boston, Mass., on mining business.

J. R. FINDLEY is general manager Portland G. M. Co.'s mines at Cripple Creek, Colo.

M. HOUK, president of the Trilby M. & M. Co., near Silverton, Colo., is in the East.

F. W. HARRELL is in New York City, on mining business, from Etzatlan, Oaxaca, Mexico.

A. LEJUNE has returned to Tincup, Colo., from New York City, on mining business.

J. J. MCSORLEY has resigned as superintendent of the Calaveritas mine at Calaveritas, Cal.

L. GINGER, manager Gold Coin mine of San Javier, Sonora, Mexico, is at Colorado Springs, Colo.

E. B. CANNAN has returned to Minneapolis, Minn., from Sauqui Grande, Sonora, Mexico.

J. B. HARRELL goes to Texas Flat mines, Madera, Cal., to take charge of their new mill.

GEO. S. TYLER has returned from San Fernando, Durango, Mexico, and is in San Francisco, Cal.

JOHN R. TREGLOAN of the South Spring Hill mine, Amador, Cal., is in San Francisco, Cal.

R. B. HUGHES, superintendent of the Holy Terror mine at Keystone, S. D., is in San Francisco, Cal.

C. EGAN, manager of the San Marcial Coal Co., San Marcial, Sonora, Mexico, is in San Francisco, Cal.

THOS. J. BARBOUR of the Risdon Iron Works has returned from San Pedro, Cal., to San Francisco.

C. A. AIKEN has returned to San Francisco, Cal., from an examination of mines at Santa Eulalia, Mexico.

F. E. WILSON, manager Friday mine, near Baker City, Or., is in Baker City from Salt Lake City, Utah.

J. SCOBEE, manager of the Pride of the West mine, has returned to Washington, Ariz., from Denver, Colo.

F. MOTT, consulting engineer of the Los Coches mine, Los Coches, Sonora, Mexico, is in San Francisco, Cal.

C. F. MASEY, manager Iron Springs gold mine, near Weiser, Idaho, has returned from a business trip East.

C. CAPP, with S. R. Nickles, mining engineer, have recently examined the Phoenix mine at Sierra City, Cal.

F. H. HUSTED has resigned as president of the Guazapares M. & M. Co., at Guazapares, Chihuahua, Mexico.

C. R. SMITH is manager and superintendent of the Wilson M. & M. Co. at Stein's Pass, Grant county, N. M.

MANAGER STANKOVITCH of the Servian-American G. M. & M. Co., near Redfern, South Dakota, is in the East.

T. F. SINGISER, president of the American Flag mine of Park City, Utah, has returned from a business trip East.

H. W. CROWTHER, manager of the Bluebird mine in Beaver county, Utah, returned to Salt Lake City, Utah, last

week, from Missouri, where he went to report on a nickel-cobalt-lead mine for New York men.

C. L. ROOD, superintendent of the Daly and Ontario mines at Park City, Utah, returned last week from California.

H. C. DAVEY, superintendent quicksilver mines at New Almaden, Santa Clara county, Cal., is in San Francisco, Cal.

MANAGER W. SNYDER of the Western Exploration Co. has returned to Salt Lake City, Utah, from an Eastern trip.

MANAGER W. C. SPICER of the Yreka C. Co., at Quatsino, B. C., has returned from Victoria, B. C., on mining business.

H. E. CAREY, who has been in Mexico for several months on mining business, returned to Salt Lake City, Utah, this week.

B. A. CARDWELL has resigned as manager Siskiyou M. & D. Association, at Yreka, Cal., and will go to Denver, Colo.

W. S. WEYMOUTH is superintendent of the Commodore mine, on Barkhouse creek, near Oak Bar, Siskiyou county, Cal.

W. M. ORR, formerly of Salt Lake City, Utah, is chief chemist for the MacArthur-Forrest Syndicate, with offices in Denver, Colo.

C. WALL is master mechanic at the Crestone-Colorado mine, La Colorado, Sonora, Mexico, vice J. W. Goodman, resigned.

J. MAY, formerly with the Valadena Co., Durango, Mexico, is assistant manager Gold Coin Co., San Javier, Sonora, Mexico.

F. A. GOURLEY of Nevada City, Cal., is superintendent of the Calaveritas mine at Calaveritas, Cal., vice J. J. McSorley, resigned.

W. A. FARISH of Salt Lake City, Utah, manager of the Majestic M. Co., near Milford, Utah, is in the East on mining business.

J. L. SHEPHERD, president of the Tril-metallic S. & R. Co. of Nogales, Ariz., is in Ohio on business connected with his company.

MESSRS. YAMADA, president, and Koda, secretary, of the Hoden Oil Co. of Japan, are examining the oil fields of southern California.

W. PARKER, manager Maggie Gibson Dredging Co., near Virginia City, Mont., has returned from an extended visit to Chicago, Ill.

E. L. DOHENY of San Francisco, Cal., president Mexican Petroleum Co., is examining the company's holdings at Tampico, Mexico.

W. BOSTWICK of New York is president of the Guazapares M. & M. Co., at Guazapares, Chihuahua, Mexico, vice F. H. Husted resigned.

J. W. GOODMAN, for a number of years master mechanic at Crestone-Colorado mine, La Colorado, Sonora, Mexico, has resigned and gone East.

SUPERINTENDENT F. J. HARRINGTON of the Quartette M. Co., at Searchlight, Nev., returned this week from a short trip to Los Angeles, Cal.

T. A. VARDEN, recently foreman De Lamar Gold Mt. mill, San Bernardino county, Cal., is now foreman Pine Hill mill, Nevada county, Cal.

L. E. AUBURY, State Mineralogist of California, has returned to San Francisco, Cal., from a visit to the oil fields in the southern part of the State.

D. H. JACKSON, formerly of El Dorado county, Cal., and later of Tonopah, Nev., is now permanently located at 1019 North American Building, Philadelphia, Pa.

F. BETTLES, metallurgist for the Newhouse Co., returned last week to Salt Lake City, Utah, from an inspection of the Hannapah mine, near Butler, Nev.

W. B. THOMPSON of the Thompson Investment Co. of Boston, Mass., is in San Francisco, Cal., from Clifton, Ariz., where he has been examining mining property.

A. M. SMITH, formerly foreman Nevada Reduction Works, Dayton, Nev., has gone to Punta Arenas, Central America, where he will have charge of a large milling plant.

F. L. BROWN, formerly assistant superintendent Tacoma smelter, Tacoma, Wash., is in charge of the laboratory and analytical work for the Oregon S. & R. Co., at Sumpter, Or.

C. M. FASSETT of Spokane, Wash., is drawing plans for a combination amalgamation and cyanide mill, which will be built this spring for the Bodie M. Co. on the north half of the Colville Indian reservation, 16 miles from Midway, B. C.

Commercial Paragraphs.

THE Ironsides Co., Columbus, O., manufacturers of special lubricants and preservatives for a variety of operating departments, recently held a convention at the Hartman Hotel of that city, at which the greater portion of the sales agents were present. The several day's sessions, which were given to matters pertaining to the various fields, culminated in a banquet. All attendants were greatly benefited through the interchange of ideas and, further, enjoyed all the social features.

THE Brown Corliss Engine Co. of Corliss, Wis., have an order from the Middlesex & Somerset Traction Co. of New Brunswick, N. J., for one 16x30x42-inch horizontal cross compound engine and one 18x34x36-inch vertical cross compound engine, and also an order from the American Locomotive Co., Dunkirk, N. Y., for one 26x42x42-inch tandem compound engine.

A. LESCHEN & SONS ROPE CO., manufacturers of wire rope and aerial wire rope tramways, with headquarters at 920 to 932 North First street, St. Louis, Mo., have opened an office and warehouse at 1717-1723 Arapahoe street, Denver, Colo., where they will carry a full stock of their various grades of wire rope and likewise manila rope, etc. This gives them four branch offices and warehouses in addition to their headquarters at St. Louis, viz., 92 Center street, New York City, N. Y.; 137 East Lake street, Chicago, Ill.; 85 Fremont street, San Francisco, Cal., and the Denver office above referred to. The A. Leschen & Sons Rope Co. manufacture all ordinary grades of wire rope and are also sole manufacturers of Hercules colored strand wire rope and patent flattened strand wire rope. They also manufacture automatic tramways which load and unload automatically, likewise several types of friction grip tramways, also single-line and two-bucket tramways.

Obituary.

H. HALE, formerly engaged in mining near Yuma, Ariz., died March 22 at his home in Tucson, Ariz., of heart failure. Deceased was 61 years of age and a veteran of the Civil War (12th Iowa Infantry). He served one term as assistant superintendent of the territorial prison and was elected to the lower house of the Legislature from Yuma county in 1896.

Catalogues Received.

Catalogue No. 5 E of the Colorado Iron Works of Denver, Colo., is a neat illustrated pamphlet on concentration of ores of all kinds by the use of the Bartlett table.

New Patents.

DEWEY, STRONG & Co's SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING MARCH 24, 1903.

723,227.—**TOY GUN**—Mark Anthony, Oakland, Cal.
723,513.—**FUMIGATOR**—G. E. Brown, Selma, Cal.
723,545.—**JAR CLOSURE**—W. E. Brown, Los Angeles, Cal.
723,440.—**FEED WATER REGULATOR**—Casey & Standehach, S. F.
723,241.—**ENGINE BOILER**—C. E. Chambers, San Jacinto, Cal.
723,243.—**CONCRETE FLUME MACHINE**—C. R. Cook, Chicago, Cal.
723,373.—**NET**—Duryea & White, Los Angeles, Cal.
723,517.—**ROLL PAPER PRINTING MACHINE**—G. H. Dworzek, S. F.
723,458.—**RELIEF VALVE**—E. R. Graham, Bakersfield, Cal.
723,602.—**FLANGING CAN BODIES**—H. L. Gushner, Ch. Cook, Wash.
723,773.—**ANIMAL TRAP**—Harter & Brown, Riverside, Cal.
723,672.—**TOBACCO PIPE**—F. Holland, Porterville, Cal.
723,676.—**PUMPING APPARATUS**—D. W. Jones, S. F.
723,471.—**TELEPHONE RECEIVER HOLDER**—G. Konigstein, S. F.
723,474.—**HARVESTER**—W. C. Matteson, Stockton, Cal.
723,495.—**DREDGER**—R. A. Perry, Oakland, Cal.
723,545.—**HOLSTER**—R. M. G. Phillips, Los Angeles, Cal.
723,305.—**B AS CUTTER**—T. B. Reardon, S. F.
723,49.—**POLE AND SHAFT**—G. A. Schenck, S. F.
723,411.—**GAS GENERATOR**—A. Schewitzer, Glendora, Cal.
723,496.—**CRYSTALLIZING**—G. E. Stadtger, S. F.
723,417.—**SPEED GOVERNOR**—C. E. Sterns, San Diego, Cal.
723,497.—**PICTURE FRAME**—C. H. Strauss, Port Gamble, Wash.
723,498.—**PUZZLE**—L. A. Svenson, Oakland, Cal.
723,436.—**BUILDING**—L. B. Valk, Los Angeles, Cal.
723,427.—**WATER ELEVATOR**—B. Van Cleave, Echo, Or.
723,566.—**CRYPTOGRAPH**—L. H. Weston, Holbrook, Or.
723,69.—**PRUNING SHEARS**—J. H. Wiles, Reeburg, Or.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co's SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

POLES AND SHAFTS.—No. 723,492. March 24, 1903. G. A. Schenck, San Francisco, Cal., assigned to Hooker & Co., a firm of San Francisco. This invention relates to improvements in metal connections for shafts and cross bars, and its object is to provide a cheap, rigid and durable connection and one which will permit shafts to be knocked down to be changed, so that any desired amount in combination with the cross bar and shafts of a casting secured to the cross bar, upper and lower plates integral with the casting, and between which this shaft is held, dowels integral with the casting and disposed intermediate of said plates, and a bolt intermediate of and parallel with the dowel and extending through the cross bar, the said dowels and plates having coincident perforations.

AUTOMATIC ROLL PAPER PRINTING DEVICES.—No. 723,517. March 24, 1903. G. H. Dworzek, San Francisco, Cal. This invention relates to an apparatus for printing the names, advertisements, or other matter upon roll paper such as is employed for wrapping packages and the like. It consists of a mechanism actuated in unison with the revolution of the roll, whereby a single impression is imparted upon the roll during the first revolution of the roll carrier, and the mechanism is then disengaged, so that any desired amount of paper may thereafter be taken from the roll without further imprint being made.

CRYSTALLIZING PROCESSES.—No. 723,496. March 24, 1903. G. E. Stadtger, San Francisco, Cal. This invention relates to a process for crystallizing rock candy and the like within bottles in which it is desired to produce an inner crystalline coating previous to the filling of the bottles with liquor. It is designed for the preparation of liquors in the form known as "rock-and-rye" or similar compounds. The process consists in the production of a thin coating of crystals granular in sugar adhering to the inner walls of the glass bottles, and in filling the bottles with a thick saturated saccharine liquid, so that the crystals of said liquid will be more readily and evenly started upon the roughened surface thus produced, and also in removing air bubbles from the crystalline surfaces.

DREDGER.—No. 723,485. March 24, 1903. R. A. Perry, Oakland, Cal. This invention relates to an apparatus for dredging material from beneath the water, and it consists in a means for advancing and fixing the apparatus at intervals, so that the excavating device can be made to work over a certain stated space while the apparatus remains stationary, and after this space has been cleared or completed the apparatus can be again advanced and start at a new station. This construction does away with the use of exterior fixtures and guides which have hitherto been placed along the sides of the boat and which are ordinarily very much in the way and which are liable to become cramped if the boat tilts from one side to the other by reason of the swinging of the weight of the excavator to one side or the other.

FUSE SPLITTERS AND CAP CRIMPERS.—No. 723,521. March 24, 1903. J. Fischler, Silverton, Colo. This invention relates to a device especially designed for splitting fuse and crimping caps upon the ends thereof in readiness for use. It consists of a pair of handles pivoted together, the operating end of one consisting of a fuse-splitting blade and one-half of the crimping segment, and by which it is operated to draw the fuse carrying the elastically mounted splitting blocks in conjunction with which this blade operates, and also carrying the other half of the crimping. This side walls of the splitting blocks may also be formed to receive the fuse transversely, so that the same blade will serve to cut it into desired lengths. By means of this tool all the work of preparing fuses and attaching the explosion caps thereon may be easily effected.

RELIEF VALVE ATTACHMENT FOR OIL WELL PUMP.—No. 723,458. March 24, 1903. E. R. Graham, Bakersfield, Cal. This invention relates to improvements in devices for relieving the pressure and preventing sand settling on the pump valve of oil and other wells. It consists of a cylindrical valve casing or cage embracing a section of the sucker rod and adapted to be supported at a suitable point in the well, a conical valve in said cage through which the sucker rod reciprocates and by which it is operated to draw fluid up, and upwardly through the cage, said cage adapted when the valve is closed to support the column of oil above the pump, and means by which this valve may be lifted to allow said column to fall when it is desired to remove the apparatus from the well. This device is applicable to any pump.

AUTOMATIC FEED WATER REGULATOR.—No. 723,440. March 24, 1903. V. F. Casey and J. P. Standehach, San Francisco, Cal. This invention relates to improvements in apparatus by which the supply of water to steam boilers is regulated automatically. It consists of a receiving chamber, a stand water pipe connecting said chamber with the water space of the boiler, a superposed supply chamber, a pipe connecting the steam space of the boiler and the stand pipe below said receiving chamber, valves controlling the admission to and discharge from said chamber, and a float valve therein and mechanism whereby said controlling valves are alternately opened and closed to admit water to the boiler according to the water level in the latter below a predetermined level.

PUZZLE.—No. 723,498. March 24, 1903. L. A. Svenson, Oakland, Cal. The object of this invention is to provide an ingenious and simple toy which will afford both entertainment and instruction, and may be called a "railroad and geographical puzzle." It consists essentially of a series upon which is depicted a map of a State or country, pockets or recesses thereon representing cities of that State or country, each pocket represented by a different color, intersecting grooves representing railroads connecting the cities, and balls representing trains traveling in the grooves, each ball corresponding in color to a particular city, the object being to get the balls into the relatively colored pockets.

HOLDER FOR TELEPHONE RECEIVER.—No. 723,471. March 24, 1903. S. Konigstein, San Francisco, Cal. The object of this invention is to afford a means for relieving the operator of the weariness and cramping of the arm often incident to this holding of the receiver in the hand when carrying on a conversation over the telephones, and it allows both hands of the operator to be

free, at the same time holding the receiver in proper relation to the ear. It is equally adaptable to portable stand telephones or to the wall telephones.

TRAVELING HARVESTER.—No. 723,474. March 24, 1903. W. C. Matteson, Stockton, Cal., assigned to The Holt Manufacturing Co., a corporation, of Stockton. This invention relates to improvements in apparatus designed to cut, thresh, clean and sack grain. It consists in a mechanism which will hereinafter be described and claimed by which the apparatus is enabled to travel upon sidehills and maintain the body of the threshing and cleaning machine in a horizontal position and the wheels in a vertical position at all times, whatever may be the inclination or variation of inclination of the ground upon which the machine is working. The object is to enable a traveling harvester and thresher to be used upon sidehills of any description and maintain the frames of this thresher and cleaner at all times in a horizontal position and at the same time maintain the harvesting wheels in a vertical plane.

Latest Market Reports.

SAN FRANCISCO, April 3, 1903.

METALS.

SILVER.—Per oz., Troy: London, 22½d (standard ounce, 925 fine); New York, bar silver, 49½c, refined (1000 fine); San Francisco, 49½c; Mexican dollars, 38 @39c San Francisco, 38½c New York.

COPPER.—New York: Standard, \$13.75; Lake, 1 to 3 casks, \$14.75@15.00; Electrolytic, 1 to 3 casks, \$14.75@15.00; Casting, 1 to 3 casks, \$14.25 @15.00; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £63 17s 6d spot per ton.

Exports of copper for the month of March were 12,840 tons, against 20,012 tons for same month last year. For the first three months of 1903 the total export of copper has been 23,354 tons.

LEAD.—New York, \$4.67½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £12 12s 6d per long ton = 2.74½c per lb.

SPELTER.—New York, \$5.65; St. Louis, \$4.60; London, £23 5s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$30.00@30.05; San Francisco, ton lots, 32c; 500 lbs., 32½c; 200 lbs., 32½c; less, 33c; bar tin, 3½c, 35c @37½c. London, £138 15s spot.

PLATINUM.—San Francisco, crude, \$18.00 @oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$45.50@46.00; large lots; London, £8 15s; San Francisco, local, \$45.00 @flask of 7½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 21c; San Francisco, Plumbers', 100-lb. lots, 17.65c.

NICKEL.—New York, 50@60c @ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.10; gray forge, \$20.50; San Francisco, bar, 3c @ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

CHICAGO CURRENT QUOTATIONS.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8. Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c @ set; 14 oz., 40s., 9½c.

CEMENT.—Germania, \$2.50 @ 2.75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50@2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8 50, long ton.

OILS.—Lined, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 22½c; Astral, 22½c; Star, 22½c; Extra Star, 25½c; Eocene, 24c; Elaine, 27½c; Water White, in bulk, 16c; Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22½c; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50@60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 50@55c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 25@26c @ lb.; carloads, 24@24½c; in tins, 35c; soda ash, \$2.60 @100 lbs.; hyposulphite of soda, 24@26c @ lb.; caustic soda, in drums, 3@4c @ lb.; Cal. a. soda, bbls., \$1.25@1.50 @ 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 8c; caustic potash 10c in 40-lb tins; borax concentrated, 7@8c @ lb.; roll sulphur, 4@6c; powdered sulphur, 2@3c; flour sulphur, French, 2@3c; alum, \$2.00@2.25; California refined, 2@2½c; sulphide of iron, 9c @ lb.; copper sulphate, 5@7c; chloride of lime, spot, \$3.00@4.00; sulphuric acid, in carboys, 66% B, 2½c @ lb.; nitric acid, in carboys, 8c @ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 5-lb. tin cans, 100 lbs. per case, ¾c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @9c per lb.

BONE ASH.—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

BORAX.—Concentrated, 7@9c per lb. powdered, 9@12c; fused, 25@30c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c @ lb.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5@7c.

MANGANESE.—(90% and over) ¾ oz., \$1.25.

MOLYBDENUM.—25c @ gramme; 1000 grammes = 2½ lbs.

CHROMIUM.—(90% and over) per lb., \$1.25.

SODIUM.—Metal, ¾ lb., \$1.25.

MERCURY.—Bichloride, ¾ lb., 90c.

PHOSPHORUS.—(American) ¾ lb., \$1.00.

SILVER.—Chloride, ¾ oz., 90c@1.00; nitrate, 55c.

URANIUM.—Oxide, ¾ lb., \$3.50.

ZINC.—Metallic, chemically pure, ¾ lb., 50c; dust, ¾ lb., 10c; sulphate, ¾ lb., .04c. (These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Drill Sharpening Machine.

Among recent devices for economizing the expense of mine operation are the power-driven drill sharpening machines. One of these ingenious mechanisms, invented and patented by Word Bros., accomplishes the ordinary work of several hand drill sharpeners and is operated by a single man. The machine possesses a number of unique features aside from its speedy operation. It forges a chisel bit for hand work or a cross-bit for machine drilling with equal speed and facility, upsetting the heated steel and forging it into a finely-formed bit of the desired shape and size. It dispenses with the "cross steel," usually welded onto machine drills, thereby doing away with the expense of cutting the heavy cross bars and welding them to the drill shank. The machine is complete within itself and will make bits of all sizes from $\frac{3}{4}$ -inch to 1 $\frac{1}{2}$ -inch steel without change in dies. It has been estimated that one man can make from the new steel bars 500 finely finished drills, unaided, in ten hours. In making a drill from new steel, or reforming and sharpening drills from the mine, no matter what their condition, broken or otherwise, no cutting off or loss of material is necessary. The first Word drill was made and operated at the Franklin copper mine, near Houghton, Mich., where it has been in use for several months. Another machine has been in constant service at the Black Oak mine, at Soulsbyville, Tuolumne county, Cal., for more than six months. Concerning it the superintendent, W. G. Scott, says: "The machine ran 183 days with nominal repairs. Average hours run daily, 4; total, 732 hours. One man operated the drill, attended his own forge and made necessary repairs. Any man who can set up and run a machine drill can run the drill sharpener. Approximate number of drills upset and sharpened, 36,000; average, 50 drills per hour. Fuel used is less than one-half that required in hand work. One and one-half minutes are required to form and sharpen a new drill. Over sixty drills have been repointed by this machine in one hour. The life of a bit sharpened by this drill is longer than when done by hand, the bits being better formed and more compact, taking a better and more even temper. The different-sized points are made with uniformity. By a change in the dies the machine will sharpen hand drills. Before we used this machine we employed two drill-sharpening blacksmiths and two helpers to make and sharpen drills. The saving of the machine over hand labor in six months has been \$1738.50; saving on coal (183 days), \$183; or a total

Drill Sharpening Machine.

saving for six months of \$1921.50." The drill is set up and working at the establishment of the Compressed Air Machinery Co., 24-26 First St., San Francisco, Cal., who are the agents and sole manufacturers of the machine. The accompanying engraving illustrates the drill sharpening machine, showing its general construction and method of operating.

The Machine Drill.

One of the difficulties which manufacturers of machine drills have to face is the lack of knowledge, mechanical skill and common sense on the part of some of the men who run their drills in mines. A machine drill is an engine carefully constructed of steel and iron, but no other type of engine made is required to stand the abuse that falls to the lot of the machine drill. Carelessly set up, fitchered holes often result, and then the chuck tender beats the drill bar with a wrench or hammer in the hope of causing the drill to become loosened, and often this has the desired effect; but if a few blows fail to ac-

complish this, he aims a heavy blow at the chuck, as many a battered chuck will testify. Now and then a man who ought to be breaking rocks in a quarry, instead of tending chuck in a mine, misses the chuck altogether and breaks the flange of the drill carriage. Neglect to oil the machine results in the piston cutting; and when this once occurs, it is more likely to reoccur, often ruining a new machine before the damage is discovered. A first-class machine man is worth the highest wages paid to miners, but a poor one is a constant source of expense. Before men are given the highest wages to run a machine drill, they should be required to demonstrate their ability to properly handle and care for the drill and to accomplish a reasonable amount of work with it.

The making of machine drill miners out of chuck tenders of two weeks' experience, who have risen recently from the ranks of the muckers, is a mistake and is a direct reflex on the mine superintendent. Machine drills are an advantage in almost every mine, in drifting and stoping, though there is much difference of opinion as to their economy in shaft sinking. The smaller machines—2 and 2 $\frac{1}{2}$ inches—are advisable in small stopes and raises and the large machines—3 $\frac{1}{2}$ to 3 $\frac{3}{4}$ inches—for drifting and in large stopes. Some object to the employment of large drills in stopes, owing to the loose character of the ground, and the fact that the heavy concussions of the drill shake down the ground while drilling, rendering the work extremely dangerous. This is entirely a matter of judgment on the part of the superintendent or foreman. If the ground be hard enough to warrant the employment of the large machines, it will usually stand well enough; but heavy charges of No. 2 powder in this hard rock may loosen and fissure the rock extensively, while not breaking it down, and in this way make the ground dangerous for the drillers on the next shift. In such cases the employment of 2 $\frac{1}{2}$ -inch machines, with at least 100 pounds of air, and the use of No. 1 powder will generally obviate the danger. As previously stated, this is a case for the exercise of the judgment of the superintendent, as no two cases are exactly alike, but experience will suggest the proper course to pursue. In using the smaller machines a drill runner, if experienced, can dispense with the aid of a chuck tender. If two machines are run in the same face, the machine runners can assist each other in setting up, each then running his machine singly.

Mine vs. Mill Samples.

Car samples, feeder samples, samples dipped from the mill battery, and others taken in this haphazard fashion, can only give approximate information, though, on the theory that, "taken at stated intervals, the several samples will average up." These methods are much in vogue, and may be employed as a rough check on mine samples. The latter, if properly taken, should give a more reliable result. Where the ore bins in mills have large capacity, ore sampled at a given date may not reach the stamps for two, three or four days, so that average results only are obtainable by this method, at best, but the monthly average should check fairly well with results obtained in bullion and tailings. The mine sampler takes his samples from the working faces in the mine daily. He estimates as closely as possible the number of tons of ore taken from each place, whether drift, winze, raise or stope, and enters the results in a book kept for the purpose. This is repeated daily, until at the end of the month the sheet shows the estimated number of tons broken daily from each portion of the mine, with its assay value. These in the aggregate give an approximate idea of the amount of ore broken and sent to mill, together with its value.

The amount of ore estimated as broken may be checked at several points along the line on its way to the reduction works. First, the number of cars trammed to the shaft; second, if skips are in use the number and capacity of skips hoisted will afford a check on report of the trammers; third, the number of cars sent from the bins at the shaft to the reduction works, and lastly, the estimated average capacity of the mill or smelter. While in practice it is found that none of these agree exactly, they harmonize sufficiently well to afford a valuable estimate of tonnage and value of headings, which approximates fairly close to the actual result.

Tailings samples are as important, and even more so than headings samples, and these should be the mill man's standby, for in them the mill foreman finds a check on what is being accomplished, and facilities should be provided in the assay office to get tailings assays as promptly as possible after samples have been taken. Particularly is this the case at a mine

where the values are not distributed with uniformity. Where this condition obtains an effort should be made to send the rich and poor ore to mill in such amount as to keep the average grade as nearly even as possible, or the rich ore should be worked separately in certain batteries. There is little satisfaction in the knowledge that the mine produces rich ore, but that the greater part of the values pass down the tail race. The construction and operation of expensive auxiliary plants for treatment of material which could have been made to give up its values in the ordinary process of milling, is expensive economy. Wherever possible the values should be obtained direct, and not by subsequent treatment. The mill man can never afford to feel satisfied until he knows from his tailings samples that he is doing the best work that can be done, or if he can, the manager cannot. The mill man who to-day is in the rut of "old times" methods must needs have a care that a younger man, with broader ideas of modern practice and a desire to apply them, does not displace him. No mill man need fear a new device being placed below his mill in the tail race when he knows from properly taken samples that his tailings are worthless. The bullion produced and the values lost in tailings afford a true statement of values, and tonnage may be ascertained by actual weighing of each car of ore, if it be desired.

A Desert Rush.

Old mining districts often develop surprises in the way of new discoveries. The latest in this direction is the discovery of placer gold in the broad drainage running southeasterly from the New York mountains to the Colorado river, in eastern San Bernardino county, California, known as the Sacramento wash. The wash is dry, excepting in time of heavy rains, which are infrequent. It drains an area of several hundred square miles, in a gold region, and the announcement that dry placers have been found is not surprising. The gold veins of the Exchequer district, north of Homer station, those at and near Ibox and numerous other districts in which it has been known for years that gold veins occur are tributary to this drainage, and as some very rich gold quartz has been found in these districts at various times, coarse gold may occur in certain localities. Whatever may be the value of the newly reported discoveries, the claims are likely, as a whole, to be disappointing, though, as usual, a few may do well. The region is typically desert—coarse sand, with scattering cobbles, and an occasional boulder, sparsely scattered sage brush and Spanish bayonet, with here and there a tuft of gamma grass. Water is scarce and only obtainable by sinking wells in favorable spots, as springs are few. In summer the heat is intense. In fact, it is not a country to invite residence, and nothing but a "gold rush" would induce men and women to tempt fate in going to such a place. Dry placers in the desert region are much the same everywhere.

The gold freed from its matrix in the vein by disintegration is moved downward on the slope of the hill together with the crumbling rocks. Heavy rains carry the detritus to the valley, leaving the rocks bare, an easy prey to further disintegration from extremes of heat and cold, tempestuous winds and torrents of rain. All of the drainage channels of the region are torrential and the large amount of water quickly collects during one of the downpours characteristic of the desert, and moves great volumes of the accumulated debris onward to a lower level. These streams subside almost as quickly as they form, and in an hour or two the fierce heat of the sun has evaporated every drop of surface moisture. To these extremes are due the arid appearance of the valleys, and the sharp, rugged outline of the hills. In some instances where the gold-bearing veins occur in low ridges, which barely project above the desert level, if the quartz be rich in gold, a good dry placer is likely to result in the immediate vicinity where the wash covers the rocks and extending out beneath the surface. In numerous desert districts large amounts of gold have been found under similar conditions, as in the Cargo Muchacho mountains, San Diego county, Cal., at Red Rock and Goler, Kern county, Cal., and in Western Australia, where conditions identical with those described occur. These dry placers not only occur in the valleys, but in the mountain slopes

and tops, as at Antelope and Rich Hills in Yavapai county, Ariz. The discovery of such districts always stimulates prospecting and usually leads to the discovery of other districts, remote from the original.

Up-to-Date Survey.

The latest notice issued by the United States Geological Survey announces that there is now in press for immediate publication Bulletin No. 213, which will be a report of the contributions to economic geology in 1902. This is somewhat of a new departure in the work of the Survey which will be greatly appreciated by mining men.

In some cases in the past reports on important districts have been unavoidably delayed and the mines have been in some cases worked out and the public interest has waned before the reports were issued, when they were practically ancient history. Director Walcott of the Survey has undertaken to meet the popular demand for prompt information from a reliable source. Among important papers in the forthcoming bulletin will be "Investigation of Metalliferous Ores," by S. F. Emmons; "Placer Gold Mining in Alaska in 1902," by A. H. Brooks; "Gold and Pyrite Deposits in the Dahlonega District, Georgia," by E. C. Eckel; "Ore Deposits of Tonopah and Neighboring Districts, Nevada," by J. E. Spurr; "Ore Deposits of Butte, Montana," by W. H. Weed, and "Lead, Zinc and Fluorspar Deposits of Western Kentucky," by E. O. Ulrich and W. S. T. Smith.

AN effort is being made to establish a fixed ratio between gold and silver. The ratio of 32 to 1 has been suggested, but it is thought some higher ratio may be adopted. Under the stimulus of the purchase of a large amount of silver by the Government for Philippine coinage the price has advanced the past week, and under the continued demand will probably go above 50 cents per ounce, but unless some fixed ratio can be established the price of the metal will continue to fluctuate as heretofore. At 55 or 60 cents per ounce, and the expectation that the value might remain fixed at that indefinitely, silver mining would receive a stimulus and many plants and mines now idle would be rehabilitated and operate at a profit.

THE Government by Act of Congress has opened to location the gilsonite-bearing lands in northeastern Utah, reserving the odd sections. Locations made prior to 1891 will be recognized, those made since that date being rejected. The mineral claims which are recognized by the Government must be relocated and the locations perfected within ninety days from the passage of the date of the Act. Locations made subsequent to 1891 are subject to relocation by the first party on the ground. The gilsonite district, which is in Uintah county, is at present the scene of unusual activity. One company, it is reported, claims 112 locations, which they are now busily engaged in perfecting.

EFFORTS of the advisory committee, appointed by Governor Peabody of Colorado to arbitrate the strike of the Colorado City millmen, has resulted in bringing about an amicable settlement of the difficulty and the mills are again running. The mines of the Cripple Creek district, which were obliged to suspend operations by reason of having no market for their ores, have also resumed work. This strike lasted forty-five days, from February 14 to April 1, during the latter part of which time the mining industry of Cripple Creek was almost at a standstill. The strike originated over the discharge of certain union millmen whom the manager refused to reinstate.

FOR several years past the Waihi Mining Co., of Waihi, New Zealand, has been a prominent operator in the dry-crushing cyanide field. During 1902, however, a change was made to the wet-crushing system and recent reports from the management of that property indicate a notable increase in bullion output and higher saving of values, showing the advantage, in that case, of wet crushing over dry. That similar results are obtainable in every other instance where the two methods are tried is not likely. The cyanide process is essentially one of experimentation, until the best possible results are obtained.

CONCENTRATES.

BARIUM OXIDE is manufactured by E. de Haven, at List, near Hanover, Germany.

MUNTZ'S METAL is 38% to 40% zinc and 62% to 60% copper and is easily attacked by sea water when made of pure zinc and pure copper. When it contains 0.2% iron or nickel it is more resistant.

A **CONVENIENT** method of testing a molybdenite ore is to dissolve in nitric acid, filter, make solution alkaline, and add an excess of lead acetate, filter off lead molybdate and determine lead in same by any of the trustworthy volumetric methods.

In many mines skips for bailing are preferred to pumps, as bailing more economical. They may be run tandem where there is room in the head frame, and where this is possible a large amount of water can be handled cheaply.

THE presence of sulphuric acid in water may be detected by the use of blue litmus paper which it turns red. Barium chloride is also used to detect sulphuric acid. When barium chloride is added to water containing sulphuric acid an insoluble precipitate is formed (barium sulphate).

MILL TAILINGS are not usually suitable in the making of concrete, as they generally contain sulphide minerals, which on oxidation will tend to disintegrate the mass. Moreover, they are usually too fine. A coarser sand is better for the purpose, and can be obtained by screening creek sand.

ACTUAL OR BRAKE HORSE POWER is the power the engine develops for use; indicated horse power depends, in fact, upon the efficiency of the engine. Nominal horse power is usually understood to mean the power developed with sufficient surplus to enable the engine to continuously run at that load.

A **RETAINING WALL** can be made stronger if the several courses are laid so as to have an inclination inward toward the bank it is to support. The base of the wall should also be broader than the upper portion of the wall. Where rock is to be supported often a dry wall will answer as well as masonry.

THE Dalmatia mine in Kelsey district, El Dorado county, Cal., in 1888 is believed to have been the first mine to be equipped with electric power in that State. Water from Rock creek ditch was utilized to drive a Pelton wheel, which ran a dynamo of 120 H. P. The current was transmitted 1 mile to the Dalmatia works and 1½ mile beyond to the Gopher Boulder.

GILSONITE, which is also called uintabite, is a hydrocarbon compound occurring near Fort Duchesne, Utah. It is brittle and has a black color with brilliant luster. It fuses readily in the flame of a candle and burns like sealing wax. Elaterite is a soft hydrocarbon compound, being elastic bitumen, resembling india rubber, and of considerable commercial value.

It is not always possible to identify a surface rock that has been much altered by oxidizing, though familiarity with certain rocks make it more easy to recognize them. Diorite and diabase, hard, tough rocks when in normal condition, often weathers to soft, decomposed masses of brownish color, wholly unlike the original rock; yet miners familiar with both are not likely to be mistaken.

THERE are in California several thousand Chinese laborers, some of whom find employment in the mines, but of these comparatively few are employed by American companies. The greater number work for Chinese companies or individuals, or work in placer mines for themselves. The total number of Chinese thus employed, however, does not probably exceed 3000 out of a total of 18,000 miners in the State. Of these very few work underground, being mostly employed in the large hydraulic mines in the northern counties.

A **SMALL** machine drill will not cut as many feet in hard ground in a given time as a large one, but the cost of operating a small machine, for wages, consumption of air, cost of repairs, etc., often make drilling with the smaller machine really less expensive than with the large ones, and the general result more satisfactory in underground mining operations. In driving tunnels of large size through hard rock and in extensive quarry work the larger drills are preferred and do cheaper work.

MATTER assumes various forms, but these may be reduced to two classes, namely, solids and fluids. A solid is a body which offers resistance both to change of shape and to change of bulk. A fluid is a body which offers little or no resistance to change of shape. The fluids may be subdivided into two types, liquids and aeriform bodies. Liquids are those which resist forces having a tendency to increase their bulk, as well as those tending to diminish it. Liquids are practically incompressible into a lesser volume. Aeriform bodies are those which

oppose any force tending to diminish their volume, but do not resist those which tend to increase it. A liquid can be poured in drops, but an aeriform fluid cannot.

BEGINNING at Gold Bluff, in the extreme northwestern part of Humboldt county, Cal., continuing past Crescent City, Cal., and to Port Orford, Or., is the ocean district most profitably worked in that section for gold beach sands, the ocean acting as a sort of gigantic concentrator, forming fresh deposits and sweeping away old workings. So far as known there has not been any successful commercial effort to utilize the force of the waves in any way in the working of any automatic gold saving device.

COPPER produced by the several mines of the Lake Superior region is not considered of equal value for certain commercial purposes, principally the manufacture of wire. That from the Calumet & Hecla, Tamarack, Osceola and Quincy being considered superior for this purpose; but all of the Lake copper brings a higher price in the market, by reason of its freedom from impurities, than the Western or foreign copper. For some purposes Lake copper is preferred to electrolytic, which is supposed to be chemically pure.

THE amount of gravel that may be moved by a miner's inch of water varies greatly, depending largely upon the character of the gravel and on the pressure of the water, as well as to a certain extent upon the volume of water employed. It is obvious that a large volume of water will move more gravel per inch than a small volume, other conditions being equal. The size and grade of sluices and height of bank attacked are also important factors. An average duty of the miner's inch would be from 2.5 to 3.5 yards per twenty-four hours.

"**OIL INDICATIONS**" are the occurrence of bituminous matter oozing from the rocks; crude petroleum flowing from rock strata; the occurrence of an outcrop of sand, shale or other formation, known to be oil bearing in depth, by having been penetrated by wells. A district may be known to be underlain by oil bearing strata, though there are no oil-bearing strata exposed within the district. Petroleum occurs in rocks of almost every geological age, from lower Silurian to recent. Shales, sands and sandstones are the most prolific producers of oil, though limestone also is sometimes oil bearing.

IN the "electrical ore detector" of Daft & Williams, the secondary current of an induction coil is taken to two iron rods which are stuck into the ground to a depth of 2 inches at a distance apart of 400 yards. It is argued that the presence of a mineral vein of higher conductivity than the average ground changes the electric waves radiated from the rods. When two other rods, connected to a telephone, are moved about, any change is made audible, and in this way lead and zinc ores are claimed to have been located in Wales and hematite in England. Similar unauthentic claims have been made for like contrivances.

A **PUMPING ENGINE** such as described by the Breckenridge, Colo., Inquirer would give precisely the same service against a hydraulic bank that a stream of the same quantity of water under the gravity head corresponding to the pressure of the engine would give. Practically, however, one would not or should not use the pumping engine to pump directly against the bank. In hydraulic mining a constant stream is not kept on the bank. One could in the case specified pump to a reservoir and take a separate gravity pressure therefrom. In that way a smaller pumping engine would give the same service that a larger engine used directly could.

MISFIRES are sometimes caused by failure on the part of the men priming the fuses failing to see that the exploding cap is free from sawdust or other foreign substance. When an obstruction in a cap can not be shaken out, or blown out, it is extremely dangerous to attempt to pick it out by means of a pin or other sharp point. Caps once placed on the end of the fuse should be "crimped"—that is, secured to the fuse by firmly pinching the open end of the cap about the fuse. For this purpose a crimper is usually provided. The practice of securing caps to fuse with the teeth is also extremely dangerous.

A **MACHINE DRILL** which has outlived its usefulness in a mine may still be good enough for use in the machine shop or for pounding samples. Mounted on timbers and provided with a suitable pestle, a machine will pulverize a 2 pound sample of hard quartz in about two minutes. It requires a deep, heavy mortar to withstand the blows of the machine, but the facility and speed with which the work may be accomplished suggest the employment of an old drill for this purpose at any mine where a large number of samples are daily taken. The machine also makes a valuable accessory to the blacksmith as a trip hammer, to be used in welding and other heavy work requiring prompt and heavy blows.

APLITE is a type of granite occurring in dikes. It is of uniformly fine texture, and is composed of orthoclase (potash feldspar) and quartz, sometimes some plagioclase (soda-lime feldspar), usually without mica, or with a very small amount of silvery white or greenish potash mica resulting probably from alteration of the orthoclase. Aplite dikes occur in granite, and in some instances the

aplite passes over from that of normal type to a phase in which quartz largely predominates, if not wholly excluding other minerals essential to the normal rock. In some regions dikes of this character have been considered as quartz veins, particularly where they are gold bearing. J. E. Spurr of the United States Geological Survey has named this dike rock "alaskite," from the abundant occurrence in Alaska of veins of this type. It is improbable, however, that quartz veins generally are formed in this manner. It is also a question if the predominant silica were not introduced at a period later than the intrusion of the dike rock, as the gold must also have been.

PROSPECTORS should take steps to inform themselves as to the character of the most important rocks, such as limestone, quartzite, slate, etc., and of minerals which occur most frequently, like quartz, calcite, clay, talc, etc. A knowledge of crystallography is not essential to the prospector, though it is well to know that certain minerals crystallize in particular form—as, for instance, quartz occurs when crystallized in six-sided prisms; galena, fluor spar, pyrite often occur in cubic form; calcite in rhombs, etc. Of course, a thorough course in mineralogy is to be recommended; but a mere smattering of it is not of great assistance to the searcher after gold, copper, lead and zinc. When starting out in the business of prospecting, the miner should learn all he can about the mineral or minerals he intends to look for, their occurrence and physical appearance particularly on the surface, as it is there he will probably make his discoveries, and not underground. Most miners present a very different appearance in the croppings of an ore body or vein from that in the sulphide zone.

CONCRETE, when employed as a foundation for machinery, should be made of the best materials. The proper materials are broken stone, free from dirt; sharp sand, not too fine, and first-class cement. The firmest concrete is made by mixing with just enough water to thoroughly dampen the cement. Too much water retards setting. Where concrete is used in building foundations for stamp batteries, nothing but the best concrete will give satisfaction. The introduction of large-sized stones in the center of the block should be avoided. Soft, crumbling rock is not serviceable. Salt water may be employed in the making of concrete, but retards setting. For one cubic yard of concrete of broken stone and sands without voids requires: 1 cubic yard broken rock with .5 of its bulk voids; .5 cubic yard of sand with 5 of its bulk voids; .25 cubic yard of dry cement. Rammed concrete is stronger than that which has not been rammed. Slow-setting cements are best for concrete. Masonry can not be employed with concrete, as it is likely to crack apart from unequal settlement. The usual formula for concrete is one part cement, five parts broken rock and two parts sand.

TOURMALINE is of several varieties, the most common being the black, known also as jst. The mineral is a complex silicate of boron and aluminum, with also iron, magnesium or alkali metals present. Gem tourmalines are comparatively rare. They are of ruby red color, have a hardness equal to or greater than quartz, and are transparent. Other colors are green, blue, brown, occasionally white or colorless. Tourmalines other than the black variety are strongly dichroic—that is, exhibit different colors when viewed from different directions. Crystals have usually the sides strongly striated in the direction of the longer axis. Often the outer portion of a crystal is one color, as green, while the center is rose red or pink. The crystals are often slender to acicular, and sometimes arranged in radiated groups, as the variety rubellite. Gem tourmalines occur at a number of localities in the United States, notably at Paris and Hebron, Maine; Hemet valley, Riverside county, Cal., and Mesa Grande, San Diego county, Cal. The value of gem tourmalines depends wholly on the color, transparency, freedom from flaw, size, etc. Tourmalines occur in dykes of coarsely crystallized granite, and are generally associated with the lithia mineral, lepidolite.

THE same rules regarding resistance due to gravity apply the same in mine haulage as in any other case where parallel rails are laid. Such resistance varies directly as the grade, and is always twenty pounds per ton, or 1% of the train weight for each per cent of grade. If there is a grade of 1%; that is, an elevation of 1 foot in a distance of 100 feet, the gravity force to be overcome is $\frac{1}{100}$ of 2000 pounds, or twenty pounds. Thus the resistance due to gravity is 1% of the train weight for each per cent of adverse grade. This gravity force is against the haulage going up grade, and in favor of it going down. The other main resistances in mine haulage, or any other kind of haulage on parallel rails, are rolling friction and curvature. In the case of a mine car train weighing fifty tons, the gravity resistance being 1%, the rolling friction resistance 1%, and the curve resistance 1%, the total resistance would be 1.5 tons, and that is the tractive effort or drawbar pull necessary to keep that train in motion whatever be the power. In the case of a locomotive the tractive power or drawbar pull is its pulling strength in pounds, measured by a dynamometer. It is the weight in pounds the locomotive could lift out of a shaft if it took the place of the stationary hoisting engine, providing the locomotive were on a straight, level track, speed not being taken into account. A locomotive will usually develop a tractive power of one-sixth of its own weight.

Mining Engineering in the Valuation of Mines.

Written for the MINING AND SCIENTIFIC PRESS by
G. W. MILLER, E. M., C. E.

The modern mineral industry in all its various scientific phases embraces perhaps a greater number of technical professions than that of any other branch of industry. Among the most conspicuous of these are civil engineering as applied to mining, or "mining engineering" and mechanical engineering as applied to mineral-chemistry or "metallurgical engineering."

Unlike the customs of former years, which included both mining and metallurgy under one head, metallurgical engineering nowadays has assumed the dignity of a profession, and claims the right of occupying a technical field peculiar to itself—distinct from that of mining engineering; nevertheless each of these still, and perhaps always shall, remain, one a

authority to confer upon its graduates any degree in engineering or science. This is not always the case, however, and in many instances members of the profession are found quite as capable as those who possess superior educational advantages. But without wishing to detract from the merit of either class, it may be truly said that a good technical education with lots of practical experience is manifestly preferable to lots of practical experience without a good technical education at the bottom of it.

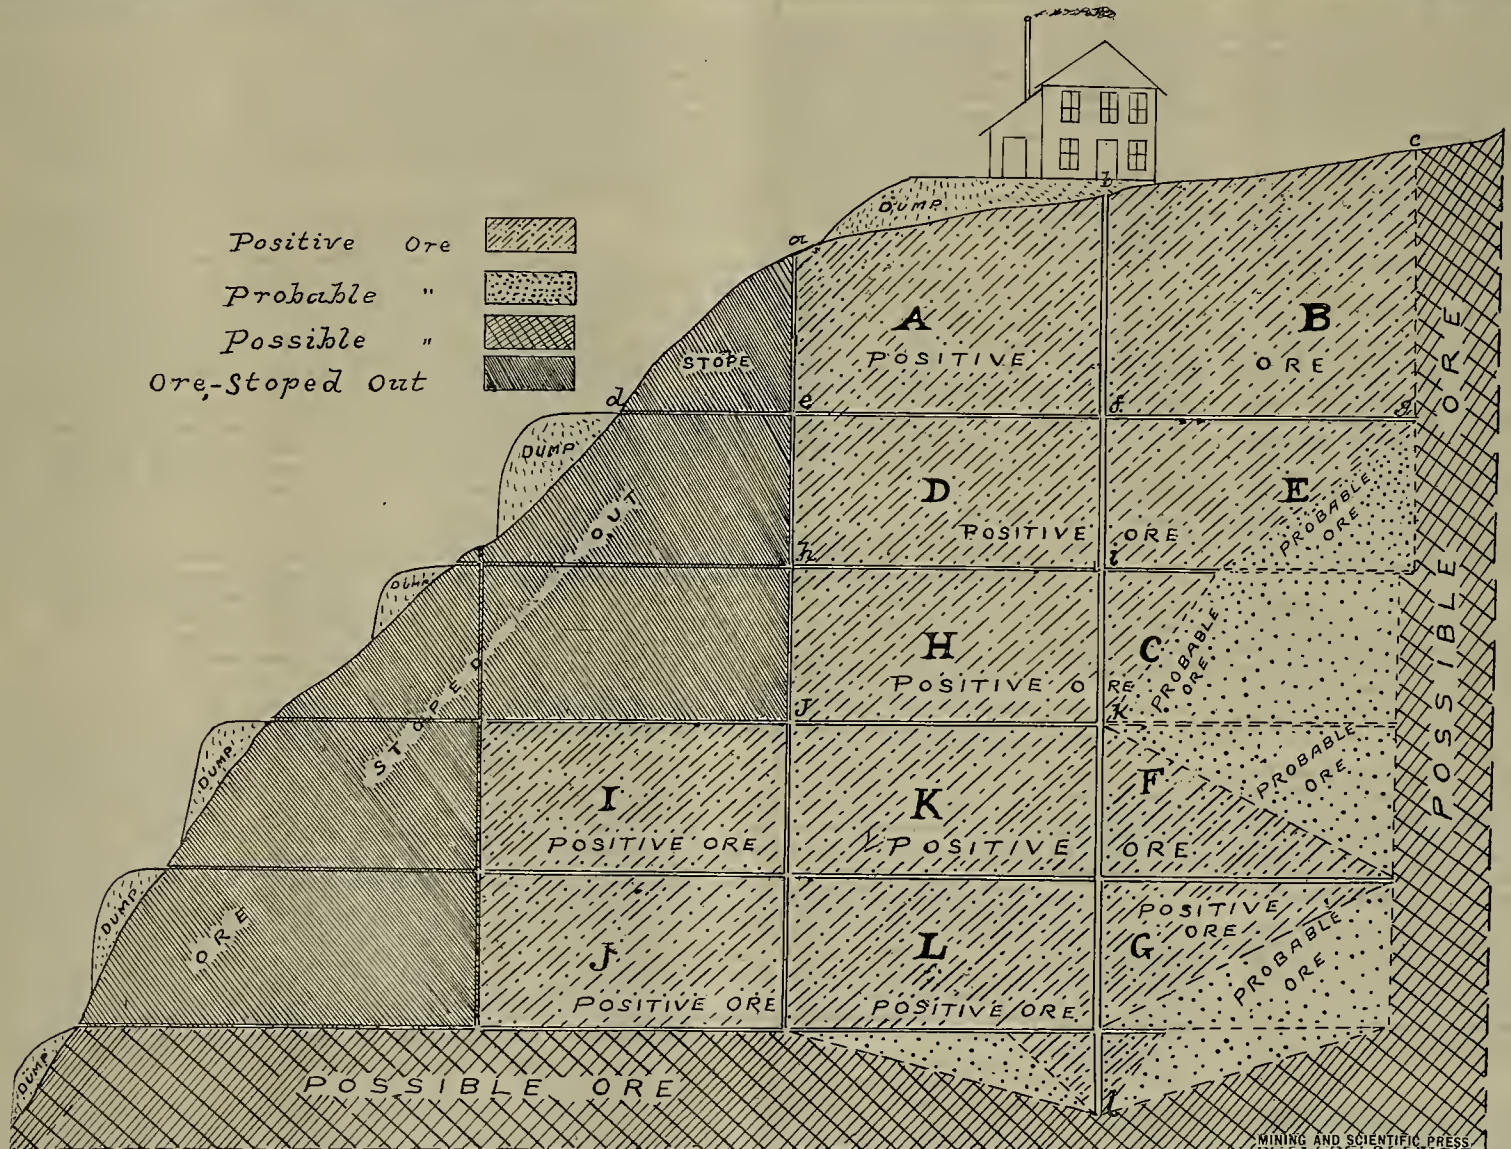

We may include under the following general divisions the prescribed duties of mining engineer proper, viz: (a) Mine examination and valuation; (b) exploration and economic operation of mines. Under division (a) is commonly included that class of the profession who have had wide and varied experience throughout the many mining regions of the world. This class of men are supposed to be well versed in the sciences of mining geology, mineralogy, etc., and hence especially expert in judging a mining property by comparison of its external geological features rather than by means of the more general systematic and expensive routine of sampling its exposed ores, if any. This class of the engineering profession

means well traveled and a good judge of a mine or prospect.

(3) He should be a good mineral chemist, familiar with the fundamental principles of the various ore mills and metallurgical processes, and especially skilled in the work of assaying and making laboratory tests of ores, proving their adaptability for certain metallurgical treatment.

A first-class school of mines places the educational qualifications of its graduates much higher than this, as will be seen from its catalogue. But as thoroughness in practice may be substituted to a certain extent for school training, the above is believed to be all that is necessary under ordinary circumstances.

ATTENDING DUTIES.—Mine operators and investors are not always technically educated mining engineers and in many instances they are quite unable to judge of such enterprises, but it is often required to determine the value of mining properties that such operators and investors already own or contemplate buying. In such cases it is customary to employ some experienced mining engineer, giving him instructions to make such investigations of the property, and procure such data as will enable him to

Method of Classifying the Ore in a Mine.

complement to the other. Some practitioners would include both under one specialty, but in the present stage of advancement of these sciences, we are unable to see how any one man can ever hope to become master of either, much less proficient in both. In the examination of mines, as well as in the operation of the same, the above distinction should be regarded, and it should be borne in mind that technically every man properly belongs to his specialty. All questions, therefore, relating to the final reduction of the ores should be given entirely into the hands of the metallurgist, who will do the rest. By this it is meant that, with regards to any mine examination, the mining engineer's duties should be considered performed and his responsibility at an end when he has designated the "ores," tested their value, and proven their adaptability for certain methods of treatment, and reported the facts as determined, together with all other pertinent conditions affecting the enterprise as an investment or resource.

EDUCATIONAL QUALIFICATIONS.—It is generally concluded that a mining engineer shall, in the first place, be a graduate of some technical school, or of some institution of learning having the lawful

are commonly known as "mining experts," or that class whose specialty is generally limited to that of judging the merits of "prospects" more than in determining the valuation of developed mines. Under division (b) belongs the more technically trained and conservative engineer, or that class of the profession who make the economic operation of "mines" a specialty rather than the geology, history, etc., of the same. This class of men go almost altogether on routine and generally estimate the value of a mining proposition from the basis of values in sight, and hence often err as seriously by undervaluation as class (b) sometimes does by overvaluation. That each class has its sphere of usefulness should not be overlooked, while absolute competence in either case is assured. But as evidence of this, the following prescribed course of training and educational requisites are considered indispensable to a successful career of either class:

(1) The mining engineer should be a thorough, practical miner, trained from boyhood in all the details and methods of underground mining.

(2) He should be a technically educated civil engineer, skilled in the sciences of structural geology, practical mineralogy, mining geology, and by all

pass opinion upon the enterprise as an investment, or a resource, as the case may be. Such instances as these are very trying, as the responsibility is generally very great, often calling forth the highest technical skill; and it is here that the three general requisites above mentioned as constituting a mining engineer's education come into play. It is manifest from the speculative aspect, that must necessarily be considered as forming an important factor in most all mining propositions, that any attempt to place a definite or real valuation upon any given mining property would most likely meet with many questions and endless ridicule, and indeed it might be alleged by some that this could not be accomplished save through purely charlatanic assumptions. But if we will divide or classify into three separate estimates the kind of valuation which it has been found reasonable to place upon any given mining property, the question then becomes a feasible one and can be handled in a legitimate and professional manner. As the valuation of any mine depends upon the value of its ores, the gross value of which is taken as a basis from which all items of expense are deducted, it is manifest that the ores should not only be considered the fundamental representative of value, but

also that these should be termed "ores" only when they will stand such expense deductions and yet show a remaining profit.*

If we will then begin with the ore of a mine, and after sampling and assaying the samples, divide the ore up as follows:

(a) Positive ore, or ore in sight, sampled on three sides.

(b) Probable ore, or ore not fully proven, including also low-grade ores in sight.

(c) Possible ore, or ore reasonably assumed to exist, but not sampled on more than one side.

(See accompanying sketch.)
We shall have, therefore, after deducting all items of expense from the ores, the definite valuation that it is proper to place upon the "mine," expressed in the following terms:

(1) Positive value.....\$	} Total
(2) Probable value.....\$	
(3) Possible value.....\$	
	} "estimated value"
	of mine, \$

In estimating the "positive value" of the mine besides the net value of "ore in sight," the value of all property, machinery, buildings, improvements, etc., belonging to the mine in any way whatsoever, should be considered as a resource, and entered as such in a separate item.

In the estimate of "probable value," the net value of all ores which are known to exist, but which are too low grade to pay at present, but which could be made to pay under certain conditions in the future, should be included; this, together with the estimated net value of all pay ores which are not sufficiently exposed to be classed as "ore in sight" or positive ore, should be entered as forming the "probable value" factor.

The third factor, or that of "possible value," is manifestly a more elastic term than that of "probable value," and both should be kept within due and conservative bounds, more especially the latter. "Possible value," of course, will depend altogether upon the tentative assumption made upon ores not known to exist, but reasonably believed to exist, within moderately defined limits. The net value placed upon such ores, after considerable qualification, may be taken to represent the "possible value factor."

SAMPLING AND ESTIMATING THE ORE IN A MINE.—It would perhaps be impossible to lay down general rules suitable for any case, or to propose a method which could be universally and advantageously applied to the sampling and estimating of the ores of any mine. (But, wherever possible, the plane of vein should be shown in graphic drawing.)

Each mine presents problems peculiar to itself which must be solved by the engineer in charge of the examination. Questions are constantly arising which must be decided by that judgment which comes only from experience and knows no set rules or formulae.

NOTE.—B. B. Lawrence of New York City is entitled to credit for suggesting the use of the terms "positive ore," "probable ore," and "possible ore."

Is Siderite Magnetic?

TO THE EDITOR:—Under "Concentrates," in your issue of Feb. 14 last, you stated: "Siderite (carbonate of iron) occurs in the Payne mine, at Sndon, B. C., which is naturally magnetic, a very unusual property in this mineral," which may prove misleading to some of your readers, for, in the sense in which the word "magnetic" is always used in common speech, it can be safely said that this mineral is never "magnetic."

On the other hand, that siderite possesses sufficient magnetic attractability to permit of its being profitably removed from zincblende, galena, quartz and many other minerals by magnetic separators, giving magnetic fields of great intensity, was demonstrated some years since by John Price Wetherill, who secured patents in the United States, Canada, Germany and many other countries covering the process.

The information given under "Concentrates" is generally so accurate, it is surprising that in this instance the slightly magnetic properties of siderite should have been mentioned as unusual, since the magnetic removal of the unroasted mineral from blende, in accordance with Mr. Wetherill's discovery, has been practiced commercially for some years, and the Wetherill patent involving the right to do so has been upheld by the imperial courts in Germany, as against would-be infringers.

The magnetic separation of unroasted siderite is now carried on by the following companies in Germany: Gesellschaft des Emser-Blei- & Silberwerks, Ems, Germany; the Bensberg Gladbacher Bergwerks & Huetten-Actien-Gesellschaft "Berzelius" Gladbach, Germany; the Silber & Bleibergwerk "Friedrichsseggen," Friedrichsseggen a Lahn, Germany; and the Gewerkschaften Lohmannsfeld & Peterszche, Dusseldorf, Lohmannsfeld, Neunkirchen, Rbs. Arnsberg, Germany.

A HYPODERMIC INJECTION of a 2% solution of hydrogen peroxide is considered the best antidote for cyanide poisoning.

Improvised Ventilating Machinery.

Written for the MINING AND SCIENTIFIC PRESS by
C. M. MYRICK.

How to get fresh air into the working face is an ever-recurring problem in mining work, and often it is a very serious one for the prospector, who must needs develop his claim with a minimum expense for machinery. Even in old-established mines the means are not always at hand for transmitting power to out-of-the-way points to operate ventilating machinery.

Not to mention the ways of inducing air currents by making double compartments in shafts and tunnels, it may be interesting to see how advantage can sometimes be taken of local conditions to solve the problem.

The direct application of heat to induce air currents can be employed in various ways, and the following is one case where the principle was put into practical use. It was desired to run a raise from the tunnel level through to the surface. The tinsmith of the town was called upon to make sufficient 2½-inch tin pipe to reach from the top of the raise to the tunnel mouth. The hunk house stove was requisitioned and set up at the tunnel, with the tin pipe leading into its damper. A few joints of stovepipe were put on and a fire started. At first it did not have much effect, but when the stove was hanked around with earth, so as to seal up all cracks, the had air and smoke were drawn out of the raise. Of course, it was necessary to keep the fire going in order to induce a circulation, but in a timber country that was not a serious matter.

Where even a low fall of water is available it is easy to construct some form of wind box with nothing but a few boards. At one mine where a small stream of water flowed down the gulch, past the tunnel, a water blast was got in operation in a few hours. (See Fig. 1.) Four 12-inch boards, 12 feet long, were

FIG. 1.

nailed together, making a box with open ends. This was stood upright in a small tank 8 inches deep and 16 inches square, in such a way that it came within 1 inch of the bottom. Just above the tank an air pipe leading underground was let into the upright box. A little ditch was then dug from the creek to a point over the tunnel, where it joined a small V trough that rested at its outer end on the upright box. When the water was turned on it dropped through the vertical box, filled and overflowed the small tank and thereby formed a seal that effectually prevented the escape of the air that was carried down by the falling column of water. There was no outlet for this compressed air, except by way of the air pipe that led into the tunnel.

In the case at hand some old 6 inch water pipe was used as an air conveyor, and the apparatus supplied sufficient air for twelve men at work-stopping and using powder. The stream supplied not over 1 inch of water, and at times much less. To get the best results we found it important that the water should drop freely in a fairly solid stream. The use of a screen to spread it over the whole area of the box was tried, but with poor results. Some claim that in water blasts built on this principle it is best to have a large air reservoir at the bottom of the upright box—a harrel being sometimes used for that purpose—but in the case described the results were very good without it.

If one would realize the power of falling water to produce air currents he should try to stand at the foot of one of the high waterfalls in the Yosemite, and feel the almost hurricane force of the wind that blows from the gorge at its foot.

At still another mine the same principle was utilized

under different conditions by putting in a water blast that cost nothing to operate and needed no attention. (See Fig. 2.) The mine was equipped with a Cor-

FIG. 2.

nish pumping system, and the water was raised from the sump by the regulation sinker having the rod passing down through the water column to the pump bucket. This discharged into a station tank 100 feet above the bottom level. It so happened that the last section of column pipe that had been put in reached some 6 feet above this tank and the water was conducted from the discharge into the tank by means of a wooden box. When it was desired to continue the bottom drift the question of ventilation came up and was solved by using this fall of water. It was not possible on account of obstructions to get a clear fall for the water, so a covered box was put in, partly on a slope and partly horizontal, and the lower end carried nearly to the bottom of the tank. Even under these conditions the large volume of water was able to create a suction of air, and the water in the tank kept the lower end of the box sealed against its escape. An air pipe was then let into the side of the box at the top of the tank. This pipe was carried down the shaft 100 feet and then through 300 feet of drift to the working face, where it delivered the necessary air.

When the supply of pipe was used up the line was continued with wooden boxes 5 inches square inside, made with the ends beveled to form a slip joint, and luted with clay. In a wet mine such boxes give little trouble by leaking air, and for temporary use, as in this case, it is economy to use them even when lumber is comparatively dear.

At a Mexican mine it was desired to ventilate a winze being sunk from the 500 level at some distance from the shaft. An old Sturtevant 4-inch blower was on hand, but nothing could be found to supply the power, and it meant a delay of two months to send for a small engine. At the 400 level was the main station for the Cornish pump. Enough 1½-inch water pipe was found to reach from that point to the winze. The column was tapped above the pump, so as to take advantage of the water pressure from there to the next station, 200 feet up, and connection made with the 1½-inch pipe. This gave a pressure of 300 feet at the bottom. Our water wheel was 18 inches in diameter and entirely home made. The body of it was of two thicknesses of 1-inch boards, with saw cuts around the circumference, into which sheet iron buckets were driven and secured by two nails. The blacksmith had quickly shaped them out of thin sheet iron into a form somewhat similar to those used on the Knight wheel. The nozzle was also made by the blacksmith from a piece of the water pipe and had an opening of about ½ inch. The wheel was mounted on a shaft with pulleys calculated to run the fan at 1200 or 1400 revolutions when the water wheel was going at the proper speed for the size and water pressure.

When belted up and water turned on it sent abundant air through a wooden box down the winze, which was continued to a depth of nearly 300 feet. The small amount of water was not noticeable in the working of the pump.

A steam hoist was set up to draw from the winze, but the power for the air blower continued to be supplied by the water as being more economical than using steam at that distance from the boilers, and, besides, the native miners could be trusted to handle a water valve when they needed air.

Crude Oil as a Fuel.*

By A. M. HUNT, San Francisco, Cal.

The question is frequently raised as to what oil is best adapted for fuel purposes and gives the greatest value per dollar expended. Within the range of fuel oils on the market to-day there is very little choice. Most of the oil sold for fuel purposes ranges in gravity from 14° Baume to 20° Baume, and the persons producing light and heavy oil each present arguments in favor of their product, attempting to prove that it has higher heat values.

In considering this question it must be borne in mind that oil is always purchased by measure and not by weight. It is true that the lighter gravity oils contain a slightly greater number of heat units per pound than the heavier oils; but in buying a gallon of heavy oil a person obtains more pounds of fuel than in the case of light oils. In the operation of the Independent Electric Light & Power Co.'s plant, at San Francisco, Cal., very careful records have been kept of the amount of oil consumed and of power produced for a period of over two years. During the first year the oil used was of heavy grade, averaging about 14½° Baume. During the second year the oil used varied from about 18° to 20° Baume. Taking the total records of the two years, if there is any difference whatever in the results obtained, I should say it was slightly in favor of the heavier oil, although the difference is so slight that it might be accounted for by factors other than the oil. The heavier an oil is the more difficult it is to force it through small pipes and connections of a plant. By properly arranging the devices, however, this point offers no difficulty, and if I were contracting to-day for fuel oil, I would not pay a fraction of a cent difference per barrel for one gravity of oil over another, within the limits of the oil that is handled in the market.

The principal application of oil for fuel is the production of steam for various uses, and the measure of value of the oil is usually taken as the number of pounds of water which the oil will evaporate, and in order that different instances may be brought to a common basis for comparison, the actual evaporation is always figured at what the evaporation would be from water at 212° F. I have made a great many tests at different times during the past eight years on this point, using boilers of different makes. The best result I have ever been able to obtain under the most favorable conditions, and with efficient types of boilers, has been an evaporation of 15½ pounds of water per pound of oil from and at 212° F., and this only when the load on the boiler was maintained uniformly during the test at the best point of economy for the boiler. I have frequently seen claims made of higher evaporation than this, but have always been inclined to discredit them. Not many years ago there was a man in San Francisco who claimed by the use of his particular type of burner to produce an evaporation that would require the oil to develop heat units in excess of what the oil actually contained; in other words, to produce something out of nothing.

In installing an oil-burning plant, the question of what type of burner to use is one that causes a great deal of worry to the average man. The number of burners on the market is enormous, each claiming to be better than any other and to produce results that exceed those obtainable by any other type. During the present year there has been undertaken by the Navy Department a series of tests as to the adaptability of oil for fuel purposes on our men-of-war vessels, and there has been lately issued in the annual report of Admiral Melville, chief of the Bureau of Steam Engineering, a preliminary statement by the board having this matter in charge. The work which has been undertaken will certainly prove of great value to all users of petroleum fuel, and the undoubted impartiality and honesty of this board gives greater weight to their statements than the usual run of reports and tests of similar character. I quote several selections which indicate the opinion of the members of this board on the question of burners, and can state that my own experience confirms them:

"That the efficiency of oil fuel plants will be greatly dependent upon the general character of the installation of auxiliaries and fittings, and, therefore, the work should be only intrusted to those who have given careful study to the matter, and who have had extended experience in burning the crude product. The form of the burner will play a very small part in increasing the use of crude petroleum. The method and character of the installation will count for much; but where burners are simple in design and are constructed in accordance with scientific principles there will be very little difference in their efficiency. Consumers should principally look out that they do not purchase appliances that have been untried and are designed by persons who have had but limited experience in operating oil devices."

"There are on file in this bureau over 2000 drawings and specifications pertaining to the use of liquid fuel, and it is said that new patents are being issued at the rate of about thirty a week."

"There has been sufficient evidence already pro-

duced to prove that in all probability special forms of burner will be required for different types of boilers."

A further point that is frequently raised in considering the use of petroleum is as to its relative value, compared with coal, and in connection with mining installations the comparison must often be made with wood. It should be borne in mind, in making any such comparison, that the words coal or wood do not express any standard, as there is extremely great variation between different coals and different kinds of wood. Crude petroleum, so far at least as produced on this coast, is fairly uniform in heat producing power. Taking the result of my experience with coast coals, and assuming Wellington coal as a standard, I should give their relative values as being about 4 to 4½ barrels of crude oil equal to about one long ton of average Wellington coal. Taking the average wood used for fuel in California, I should place approximately two cords of wood equal to one ton of coal. I have frequently heard oil men give the relative value of oil and coal as 3½ barrels of oil per ton of coal, but consider that this figure is apt to lead to disappointment when actual tests are made.

I have been asked to make a hurried comparison as to the cost of power developed on tide water of San Francisco, in large units, using fuel oil, with the cost of delivery of electric power over a long-distance line, assuming the power to be produced from some one of our many mountain streams. In making this comparison, I was asked to take plants capable of delivering 50,000 H. P. each, and assuming the distance of transmission to be 200 miles.

The data which I have used for the steam plant is as follows:

That the plant shall contain eight 5000 kilowatt steam turbine-driven alternators, and to be fitted with the best type of boilers, auxiliaries and all devices for economy. I have taken the price of fuel at 55 cents per barrel, at which rate long-term contracts have been made for large quantities of oil within the past few months. I have assumed that the hydraulic plant will have an equal number of units driven by impulse wheels; that the distance of transmission, as before stated, will be 200 miles, and the voltage for transmission 60,000.

In order to eliminate as many items from the comparisons as possible, I have made a close estimate of the cost of the steam plant, the data of which can be absolutely determined, and I would state that this estimate is based on present prices of machinery, and confirmed by the results obtained in the erection of large plants within the past few years. In the case of the hydraulic plant, these elements are not absolutely determinable, as each individual case is a law unto itself.

The cost per horse power installed in the steam plant is, however, such that I can positively state that to equal it in any hydraulic plant, taking into account the hydraulic development, power-house machinery and everything up to the point where the power goes onto the line, would require that the conditions should be extremely favorable, and I doubt whether there is any locality in California—at least, none with which I am acquainted—that would permit an equally low cost. The amount of labor in the steam plant, using such units as have been indicated, and with the small amount of labor required in operating a boiler plant using oil, would be no greater than the labor required to operate the hydraulic plant and care for the water system. The items of cost which should be compared and which I have assumed and taken, are the interest, depreciation and taxes on the cost of the pole line and the cost of patrolling and caring for same; in the steam plant, the cost of fuel, water required for steam, and miscellaneous supplies. The amount of fuel required to produce the power I have taken from the actual results and experiences in plants which I have operated, and while the conditions are such that it is not possible to lay before you in detail the record of operation of these plants, I can assure you that the figures are absolute and correct. It is probable that any figures which I may lay before you will be criticised and attacked, but I have endeavored to give them without bias or prejudice, in order that the comparison may be absolutely fair.

The amount of copper required to transmit 50,000 H. P. a distance of 200 miles, at 10% loss under normal conditions, is approximately 16,000,000 pounds. It would be absolutely necessary to erect at least two distinct and separate transmission lines, in order to guarantee continuous operation. I have figured on using a form of tower construction that would make stability the first item of consideration, and would give as my estimate of the cost of such lines \$3,500,000, which would cover cost of material and erection, rights of way, etc.

I will take, first, the cost per horse power, when same is called for and taken twenty-four hours daily for 365 days per year. In the case of the water power plant, it is immaterial what the number of hours may be. The cost of operation per horse power of plant installed remains the same, as the operating cost is a lump sum which does not vary with the number of hours' use made of the current. I have assumed, for the purposes of calculation, that interest, depreciation, taxes and all other charges against the pole lines will be covered by 12% on the investment therein and I do not think that this is in any way excessive. The total charge, therefore, against the pole line

would be \$420,000 yearly, or the sum of \$8.40 per horse power per year.

Under similar circumstances, operating the steam plant twenty-four hours daily and 365 days per year, the output of the steam plant per horse power installed would be \$19.68, showing a very great advantage for the water power. However, there is no instance in which power is taken twenty-four hours daily for the entire year. It must be remembered that these figures do not represent the actual cost of producing power, but are only the cost of the items not common to the two cases compared.

I have made a second comparison, taking the actual operating conditions as they obtain in the city of San Francisco, in a plant carrying both power and lighting load, as well as a portion of the street railway system. The load of this plant is absolutely representative of the local conditions, and any person figuring on entering San Francisco market with transmitted power must figure on the conditions as they actually exist. It should be borne in mind that during the winter time the amount of load taken by practically all consumers is very considerably increased, and that they will all make heavy demands for a very limited time in the evening during such months. As an example, all factories operating and taking current from an electric power company need lights for a comparatively short time, at period between half-past four in the afternoon and the time of closing, and to meet this demand machinery must be installed which will be entirely idle during a great part of the year and only operated for a short time daily during the balance of the year.

It will be very surprising to any of you to know the actual facts with reference to the street railroad load in the city of San Francisco. I believe I am well within bounds, basing what I say on information received from parties well informed on the matter, that the maximum load during the twenty-four hours on the street railway system is at least three times the average, figured on a 24 hour basis. Taking the cost for delivery of power, under conditions as they actually exist with the hydraulic plant, the cost would be \$8.40 per horse power per year. With the steam plant this figure becomes \$5.72, showing that with the conditions as they exist at the present time, the character and class of load being taken from actual results, the price of fuel being taken on the basis of contracts lately made, the steam plant has the advantage.

In this connection it should furthermore be borne in mind that there is little or no probability of the cost of transmitted power being reduced. The only way in which the charges under consideration in the present instance could be lowered would be by increasing the voltage at which the line is operated. It seems to be the general consensus of opinion, and as the results of experiments made, that the voltage of 60,000 is as high as we may expect to see used unless some radical unforeseen developments take place. The converse is the case with reference to power generation from fuel. The entire engineering world is at the present time in a state of ferment over the solution of this problem. Internal combustion engines are being developed more and more, and types in which oil may be used direct in the cylinders of the engine are coming to the front and promise practical results. The Diesel motor has lately been taken hold of by a large company in New York and will be vigorously exploited in this country. Reliable tests show that it will yield a horse power with two-thirds, if not less, of the amount of fuel used by the best steam engine. A new type of oil engine, of 200 H. P., is under construction in this city at the present time that promises to give a horse power on less than one-half of the fuel oil used with the best steam engine. And it seems more than probable that within a very few years present results will be greatly improved.

With the amount of fuel oil which is being produced on the Pacific coast and the conditions which exist with reference to other fuels, it has always seemed to me that it should be adapted to a greater variety of uses. A considerable amount of work is being done at the present time in the utilization of crude oil to the exclusion of coal in the production of gas, and this promises to become a quite important factor in the crude oil market. There is no reason why crude oil should not be applied to forge work and heating furnaces, and this is done in some of the Eastern manufacturing, not only on the score of less cost, but greater convenience. I see no reason why the high-priced coke used by foundries should not be replaced by crude oil. It would involve the necessity of modified forms of cupolas and, possibly, the adoption of some type of hearth furnace, but the incentive would seem to me sufficient to justify experiment in this direction. If iron is ever to be smelted on this coast, it would seem to me that it must be done with oil fuel, or at least with its aid. It is believed by leading metallurgists that the presence of solid carbon is necessary to the reduction of iron ore; but even this factor does not necessarily preclude the use of crude oil, as it contains on the average approximately 84% of carbon, and it is by no means an impossibility that the problem may be successfully solved.

STONE ARCHES are sometimes employed in mine work to support ground, but they are not in common use. This sort of structure is often advisable at the entrance to tunnels and inclined shafts.

Milling at the Camp Bird, Colo.*

By THOMAS H. WOODS and GODFREY D. DOVETON.

The output of the Camp Bird mine, Ouray county, Colo., may be considered ideal milling ore, yielding its values readily to amalgamation, vanner concentration, and subsequent cyanide treatment of the tailings. The method of treatment, while it offers few new features, is of interest as an example of the reduction of a docile ore. The following is a synopsis of the method employed: Breaking with crushers, pulverizing with stamps, copper plate amalgamation, vanner concentration and direct treatment of the tailings by cyanide.

THE BREAKING OF THE ORE—The loaded tram buckets, after leaving the tramway terminals, are trammed on suspended tracks to the crusher house and dumped on grizzlies. Each ore bin, of which there are three, is equipped with a grizzly at each end, the fines passing through to the main bins, while the coarse falls to the crusher jaws, and thence to the ore bins. The grizzlies, 12 feet long, set at an angle of 45°, pass all material under 2 inches. The rock breakers, 9x15 inches, set at 2 inches, are placed directly over the center of the ore bin. This arrangement insures a comparatively good mixture of the fine and coarse rock.

ORE BINS—Each of the bins has a capacity of 180 tons. The floors are set at an angle of 45° and lined with ½-inch boiler iron. The chutes, from the bins to the automatic feeders, are controlled by a rack-and-pinion gate. In addition to these ore bins there is a large reserve storage containing sufficient ore to run the mill for six days.

THE STAMP BATTERY—Foundations: Trenches 10 feet in depth are blasted out of the solid rock, and mudsills placed in the bottom are securely wedged against the sides of the pit and packed with concrete. Upon these the mortar blocks, of 2 inch plank set on end, are spiked and bolted together. Two sets of binders, front and back, are bolted to the mortar block, but not to the battery timbers. The writers are of opinion that less jar is transmitted to the battery timbers when they are not bolted to the mortar blocks, so that they do not get the jar due to the impact of the stamps.

The mortar rests upon a rubber gasket ¼ inch thick and is bolted to the mortar block with four anchor bolts, front and back. The battery frame timbers are made of the best grade of dressed Oregon fir. The king posts are bolted to the street sills with 1½-inch bolts of Norway iron. All bolts in the framing are of Norway iron, since cast iron is of little use when subjected to such vibration. The king post is also bolted to the ore bin above and below the cam shaft floor. The mortars are of the Homestake pattern, but amalgamation is not conducted inside. It has been found advantageous here to use the battery as a pulverizing machine only, for a very perfect amalgamation is secured on the apron plates.

The cam shafts are of hammered steel, 6 inches in diameter and 14 feet long, fitted with Blanton cams. Both steel and cast iron cams are used, but steel cams have given the most satisfaction.

Babbitted journal boxes are still in use, although two cam shafts are running in hearings without babbitt. In the writers' experience, however, babbitted boxes are to be recommended, for the following reasons:

1. The alignment of the shaft can be more easily kept true with a babbitted bearing, because, no matter how carefully the battery foundations are erected, a small amount of settling is sure to take place. This increases the difficulty of shimming up a cam shaft bearing or a battery post.

2. In replacing a broken shaft with a new one, more perfect bearings can be obtained. Bearings without babbitt have a tendency to wear to a greater or less extent.

During the last four years, with an average of forty-five stamps per shaft, four cam shafts have been broken. This remarkably clean record is due in great part to the excellency of the battery foundations. Extra cam shafts are, however, always kept on hand ready for use.

THE STAMPS—The stamps weigh 850 pounds each and drop 100 times per minute. The speed has recently been changed from 90, with the result that the capacity has been greatly increased, a better splash obtained, and a consequent reduction in slimes observed. The order of drop is 1, 4, 2, 5, 3. The drop is set at 6 inches, and, as the shoes and dies wear, reset at 8.

The even distribution of the weight in stamps is a matter frequently overlooked by machinery manufacturers, too much weight being often apportioned to the stem and boss, with a tappet too light for the work it has to do.

The stems are made of soft steel, 14 feet in length, 3½ inches in diameter, and weigh 380 pounds. When broken at both ends they are sent to the machine shop, thoroughly annealed, turned in a lathe, and again put into service. The tappets weigh 80 pounds and are both of cast iron and steel. The latter is

much preferred—they rarely break, have a much longer life, and seldom require facing.

The automatic feeders are mostly of the Challenge type, but four are of the suspended type. The feed tappets are attached to the middle stamp stem. Solid feed collars have been in use until recently, but are now replaced by a sectional feed collar. A great deal of time is saved in replacing a broken feed stem by their adoption, as no chipping of the broken stem is required. The hoeses are of cast iron, weigh 250 pounds, and are attached to the stem in the usual manner. The plugs are removed with careful charges of giant powder.

The shoes weigh 140 pounds when new, and are attached to the hoeses with hardwood shims. Soft wood has been found useless for this purpose. Three kinds of shoes are in use in the mill at present and a comparative table showing the cost, life and wear of iron per ton of ore crushed may be of interest:

	Chrome Steel.	Forged Steel.	Cast Iron.
Cost per lb. at mill, cents.....	8	6½	3½
Weight when new, pounds.....	140	137	135
Weight when discarded, pounds...	35	40	40
Actual life, days.....	106	72	41
Wear per ton ore crushed, pound..	.318	.43	.71

The cost of iron per ton of ore milled was, in the case of the chrome steel, 25 cents; with the forged steel, 2.75 cents, and with the cast iron shoes, 2.4 cents.

As the result of the above experiments, and taking everything into consideration, the chrome shoe was ultimately decided upon as the most economical at the present time. Forged steel, chrome steel and cast iron dies have been in use.

The chrome steel dies were of the sectional type, which possess some advantages in being readily removed from, and replaced in, the mortar. They also give a more constant depth of discharge. On account of the short life of the die top, however, and the annoyance caused by chips of steel from the mine getting between the top and the base, they were discarded for a solid forged steel die. The relative wear of the different dies is shown in the following table:

	Chrome Steel.	Forged Steel.	Cast Iron.
Cost per pound at mill, cents.....	8	6½	3½
Weight when new (tops), pounds..	76	143	140
Weight when discarded, pounds...	22	50	50
Actual life (tops), days.....	41	80	42
Wear per ton ore crushed, pound..	.42	.36	.75
Cost per ton ore crushed, cents....	3.36	2.30	2.4

Chuck blocks 4 inches, 3 inches and 1½ inch are employed to keep the depth of discharge as constant as possible. The height of discharge is normally 5 inches, and at this the slining is reduced to a minimum and the maximum crushing capacity attained. Forty-mesh slot screens have been in use until recently, but have been replaced by 25-mesh, No. 29 wire cloth. The wire screen is infinitely superior and cheaper, having a greater discharge area, and the constant annoyance experienced by chips when the slot screen was in use is entirely abolished. The batteries can also be fed much lower than formerly, with desirable results.

The cost of a slot screen at the mill is \$1 49, and that of a wire cloth screen \$0.85. The former has a life of three days, or 46½ tons of ore, the latter a life of six days, which corresponds to the crushing of 93 tons of ore. Thus the slot screen costs 3.2 cents per tons of ore crushed, while the wire cloth screen costs but .9 cent.

(TO BE CONTINUED.)

The Weston Electrical Measuring Instruments.

The portable direct reading electrical measuring instruments made by the Weston Electrical Instru-

Weston's Direct-Reading Voltmeter.

ment Co., Waverly Park, Newark, N. J., are high grade and popular.

In the distribution of electrical energy in mining, for lighting or power purposes, it is essential for economical and satisfactory service to maintain a constant relation between the supply and demand.

Variations from the normal ratio of supply and demand means money lost.

To be of any real value an indicating instrument must be theoretically correct in principle, accurate throughout its entire range, simple in construction and economical in operation. The principle embodied in the Weston instruments consists in the simple movement of a small coil through a uniform magnetic

field against the opposing force of a very light spring. By avoiding the use of all moving iron parts, magnetic lag is eliminated. The principle of its construction involves a uniform magnetic field, forcing the coil to which the pointer is attached to take up a position corresponding exactly to the amount of current passing through it. In construction these ammeters and voltmeters have but a single moving part, consisting of a little coil weighing a small fraction of an ounce, and to which the pointer traversing the scale is directly attached.

The Weston standard voltmeter, with its wide range, simplicity and accuracy, is deemed a valuable adjunct to mining plants, as by its use one can tell in a glance the voltage of the current employed and thus regulate the supply to the demand.

Having what are claimed to be the largest and best equipped works in the world for the production of electrical measuring instruments of all kinds, the Weston Electrical Instrument Co. states its ability to turn out work of any special character in which excellence of mechanical and electrical work and design are important features.

The company has recently opened an office in New York City, and are represented on the Pacific coast by Frank E. Smith & Co., 418 Eugenia avenue, San Francisco, who extend a cordial invitation to all interested in the subject of electrical measurements to call upon them either for the purpose of inquiry, on the technical points involved, or for the prospective purchasing of instruments.

Smooth-On Iron Cement.

Many breakdowns are incidental to machinery subjected to steam and hydraulic pressure and can be successfully repaired by the use of the material known to engineers as Smooth-On Iron Cement. The uses of this material in repairs are numerous, and one of these is shown in the engraving, which is of

Pump Repaired With Smooth-On at U. S. Navy Yard, New York City.

the repairs to a large centrifugal pump in a drydock pumping station, New York Navy Yard.

The following is an extract from a report made by an engineer in the department of construction and repairs:

"For over four years I have used your Smooth-On Iron Cement No. 1 and have found it to be as good as a new casting when used in repairing breaks in castings. I have found it to make steam joints tight when everything else failed. I have used it on porous castings that had to stand 180 pounds steam pressure. I have used it on steam pipes that leaked, and will say that I have never had any trouble with anything I have repaired with same.

"About four years ago one of our 45-inch centrifugal pumps split almost in two, due to a sudden strain. The crack was over 20 feet long and in some places opened up ¼ inch. To replace this pump would take months, and we needed it badly. This fracture was repaired with Smooth-On Iron Cement No. 1 and the pump running on the third day after the break, and ran successfully for thirteen months, when it was replaced by a new pump. The repaired pump was, however, giving as good service as when first repaired. This pump (above cut) broke about one and one-half years ago, and was repaired with Smooth-On, as was the first pump, and it never has given us any trouble since. The cut shows the pump as now in use. The fracture extends from A through B to C and from C to D. Patches 1, 2 and 3 are brass; straps 4, 5, 6 and 7 are of wrought iron. Smooth-On was used in fractures and under patches and straps.

"When the new pump was placed the flanges connecting the gate valve with the pump did not come in line by 2½ inches. To make this joint the pump

*Trans. Am. Inst. Min. Engrs. (condensed).

flange was cut off, a plate of wrought iron was flanged and shaped to fit the interior of the main and bolted to it, so the flange fitted the flange of the gate valve. Both the flange joint and the joint between the main pipe and the inserted flanged sleeve were made with Smooth-On.

"The suction pipe to this pump broke in two, underground—due to settling of the ground—over three years ago. This was also repaired with Smooth-On and has never given trouble since. I have had at least a dozen more of these breaks, and after repairing them with Smooth-On have never had any trouble with them."

Smooth-On Iron Cement No. 1 is a metal cement, which, when properly mixed with water, metallizes and slightly expands during the process, which action makes it invaluable for many mechanical uses.

This iron cement is made by the Smooth-On Manufacturing Co., Jersey City, N. J., U. S. A., who will send their illustrated book free.

This substance is for sale in San Francisco, Cal., by the Western Repair & Supply Co. of 61 Steuart street, who will furnish any desired detailed information.

Late Improvements in Copper Smelting.*

By HERBERT LANG, M. E.

The last twelve years, comprising the final decade of the nineteenth century and the beginning of this, have seen very great improvements in the metallurgic arts, particularly in those which are susceptible of being placed upon a scientific basis. The application of chemical principles and the study of design have together assisted in the most remarkable advance that the method of ore treatment has ever shown, an advance that has been, for reasons that will suggest themselves, more marked perhaps in the domain of smelting than in any other industrial pursuit in which mankind has been engaged. The directions in which this advance has been made and the forces that have conspired to make it are the subjects of this writing.

Copper smelting is far from being a new art. What we know of it is made up of a mixture of facts and theories, parts of them the outgrowth of the study of science, part the heritage of ages during which the art of getting copper from ore has been practiced. Strictly speaking, there was no science of smelting until within a few years past, and it may be disputed by some whether even now we have a really scientific conception of smelting sufficient to cover it in its numerous phases. On that subject there is not much to say, but on the purely practical side, there is no more fertile subject than copper smelting, and it is upon this phase that I desire to chiefly touch.

The most marked tendency of late years has been toward the increase of capacity of smelting plants. This has been accomplished in a variety of ways. The most obvious method of increasing the daily capacity of a furnace is to enlarge that furnace; and this has been done in most cases, until in place of the little stacks of a dozen years ago, smelting perhaps ten, twenty or thirty tons daily, we now see leviathan furnaces handling 100, 200 or 300 tons, and even these capacities are not regarded as so wonderful since much larger furnaces have been projected and even built. What the iron furnacemen of ten years ago would have regarded as a very pretty day's work, namely, the reduction of 200 to 500 tons of ore, in a furnace 60, 70 or 80 feet high, the copper smelter is now accustomed to put through a furnace of 20 feet high, with equal ease. Much of the success achieved in this line is due to the improved methods of handling which copper smelters have borrowed from the iron men, whose experience in the manipulation of enormous quantities of material has been of invaluable assistance to the world. To their mechanical devices for such purposes we are much indebted. In still other ways are we indebted to iron smelters, particularly for the principle, or rather the mechanism, of the Bessemer converter, which has been adapted to the purposes of copper production with the greatest success. It has likewise been attempted to introduce the open-hearth furnace, in the form known as the tilting hearth, as used by steel makers, but it is questionable if its use will ever get beyond the works at Great Falls, Mont., where it was first inaugurated.

In many other respects, copper smelters have struck out for themselves, and have made such changes and improvements in their craft that to the practitioner of a dozen years ago it would hardly be recognizable. The greatest and most distinctive of these changes are due to the pyritic process, which has come to take rank as the most scientific of all the branches of metallurgy that have relation to precious metal mining. By its aid, the domain of copper smelting has been extended to varieties of ore which were formerly not supposed possible of profitable reduction by any process whatever, being given up by the metallurgists of that era as too refractory for any mode of treatment. Without this process there would be no means of handling, for instance, the heavy masses of sulphides of iron that compose so

great a part of the mineral resources of all gold and silver mining regions. Although the pyritic process was introduced originally for the purpose of treating sulphides of this sort, its usefulness in treating other varieties of ore has been demonstrated thoroughly, and the utility of other smelting methods has been greatly enhanced by the natural reaction of one process upon another, but particularly by the application to other processes of the principles and deductions which the intense study of the pyritic agencies has brought forth. It is not likely that any other metallurgical process or family of processes has ever received as close and persistent an examination at the hands of science as has the pyritic method. For, coming on at a time when the curiosity of the metallurgical world was aroused by the high promise of the process and the study of chemical metallurgy had begun, there were many acute observers who took advantage of the occasion, and by whose united labors, added to those of the inventive class of practitioners, the process was subjected to thorough examination and extensive practical improvement.

Among the difficult classes of ores whose qualities have been overcome by this new aid to smelting, are the arsenical and antimonial substances which from time immemorial have given annoyance to the miner, interfering so disastrously with the extraction of silver, lowering the quality of copper, and lessening the saving of gold in those ores which contained the deleterious matters. Arsenic especially was the great bugbear; and even now the custom smelters, remembering the old and not unreasonable

although the proportion of paying ore to the amount smelted is not usually more than one-half. The practice, which has been evolved by the genius of Dr. Carpenter, who combines great experience with high professional skill, results in the production of a matte, one ton of which contains all the values of at times forty tons of ore. The same thing with some modifications is being done at one or two points in Colorado, the smelting process in use at Deadwood having been transported to a favorite field of metallurgy, the Gilpin county gold region, the home and birthplace of the distinctive style of stamp milling, known as the Colorado method of high and slow drop. There is every indication that even here the smelting processes are bound to displace the rival but less perfect method. It has been suggested to smelt direct the hulk of the copper ores of Butte, Mont., which by the existing practice are first concentrated and then smelted. In order to understand fully the nature of the proposal, let us examine briefly the condition of things and the processes now made use of at that great camp. In the first place, the ore, to the enormous daily extent of 6000 or more tons, is concentrated by water, whereby its copper percentage is raised from four or five to from fifteen to eighteen. The concentrated material is now roasted in mechanical furnaces down to an average content of 5% or 6% of sulphur, and then, while still hot, is fed into reverberatory smelting furnaces of the largest size ever made. At times there have been a hundred or more of these large brick furnaces running on Butte ores or concentrates, producing a 50% matte for

BIRD'S-EYE VIEW OF

prejudice, charge the miner a penalty if his ore contains an appreciable proportion of it. Ores containing arsenic as an essential ingredient, in the form of mispickel, have been treated by the pyritic process with a complete and entire volatilization of this hurtful element, which then becomes the easiest of all substances, which we find in ores to get rid of, hardly excepting the moisture which may be combined with them. It often happens that water itself is so strongly combined with the other constituents of ore that it is expelled therefrom with some expense of fuel, but arsenic in the pyritic furnace is dissipated and driven away at a still lower temperature.

Tellurides of gold and silver, that give troubles in amalgamation and concentration, give none in modern smelting; and the sulphate of baryta, that interferes with the lead and ordinary copper smelting methods, is disposed of in pyritic work with ease. The latter substance forms the main part of the charge at the new Crofton, British Columbia, smelter, and might be supposed to be objectionable under the circumstances there, but contrary to the usual case, it is easily eliminated under skillful management, forming a very good object lesson in the adaptation of a process to uncommon conditions.

We should not overlook the extension of the smelting processes to what was once regarded as the exclusive field of milling and concentration. An instance of this is the treatment at Deadwood, South Dakota, of great quantities of comparatively low-grade siliceous gold ore, carrying hardly ever more than \$10, and frequently but \$5 per ton. This is fluxed exclusively with limestone and melted with coke, brought from a great distance, but so cheaply is the work carried on that it yields a good profit,

the converters. These items are worth our consideration, for they imply the greatest improvements that have ever been made in the reverberatory form of smelting. The furnaces are heated with coal, and the largest burn twenty or more tons in a day, beyond which it was supposed to be practically impossible to go, on account of the difficulty of supplying so exacting a monster with fuel. Some of the furnaces have produced and are fired with gas, which is in some ways an improvement over direct firing, yet the practical verdict at Butte, which is a very practical place indeed, is to the effect that the complications necessary for the purpose outweigh the undoubted advantages.

Having got a suitable matte, containing about 75% of the copper of the original ore, the rest being lost in previous steps, especially in concentrating, the next step is to bessemerize it, getting blister copper, usually referred to as bars, simply. Now it is proposed to substitute for this ingenious and very practical process, which has grown up in that precise spot and attained a development in ten years greater than Swansea achieved in 300, by a single operation, which shall lose but half as much copper and cost no more for carrying it out. Direct smelting of the ore as it comes from the mine will obviate even the crushing, as it is one of the virtues inherent in modern smelting in big furnaces that it will take in pieces of any size, just as they come out of the mine. The great question is that of flux, as it is in most other—we may almost say, all places. Having this, and having, which is a difficult thing to get, the money to engage in this pursuit, the next thing would be to build a works wherein half a dozen, or at most twelve, furnaces should do the work that the hundred rever

*Trans. California Miners' Association.

heratory, half a dozen blast, 300 or 400 roasting furnaces now do. It can be done, there is no doubt of it. But the question is, will they consent? Will the proprietors of works which have made more money in the last three years than anybody ever before made in the smelting business, allow the experience and the improvements which have built them up, while giving Butte its name as the greatest mining camp, submit to tear down what they may reasonably call the foundations of their fortunes? I think not, at least not until hard times come and economies are necessary. Men who have grown up with the industry—beginning at the time, for example, when I myself first saw Butte—when the smelting reverberatory which now averages fifty tons or more daily, sometimes reaching 100, and even 140, then put through ten or so, and some much less, they will be very loth to leave so many grand traditions behind and seek out new paths.

THE COST OF SMELTING.—The final criterion of any process is its cost per ton of ore treated. All other considerations are lost sight of in the universal cry for cheaper, and therefore more profitable, treatment. Time has been, and that not beyond the memory of most of us, when it cost the miner on the coast \$100 a ton to get his ore smelted, and there was no great profit in the smelting business even at that figure, if we can believe the word of those who were engaged in it at the time. Things have changed somewhat, and while many get their product treated for \$4, \$5 or \$10 per ton, a good many get it smelted for nothing, because the smelter wants it for flux. This is

amples are very near the lowest low-water mark of cost, and will undoubtedly remain so for some time. They can only be surpassed by plants combining the favorable features of large operations with cheap fuel and steady labor, good fluxes and first-class management. With these advantages, the reverberatory furnace has made rather good records. At Butte, two years ago, it was shown in court that the cost per ton of smelting the roasted and still hot calcines was but a trifle over \$2, and that, with coal screenings, to be had in Butte for \$1 per ton, the cost was reduced considerably below that figure. We must not forget that it is in application of the reverberatory to fine grained material, like the roasted calcines, that that furnace has achieved its greatest triumphs. To supply the stuff hot is also a great and striking advantage, comparable to nothing whatever in blast furnace smelting. This practice, curiously enough, is of English origin, being one of the few instances of British metallurgy that still survives in America. As I before mentioned, the strength of modern metallurgy lies in its groundwork of science, and nowhere is this better exemplified than in the present practice with the reverberatory furnace, which is now run with as much care and attention to scientific principles as the blast furnace, and usually with an imitation, more or less close of its methods of slag-building.

Excellent as has been the work of the past decade, we may reasonably look for better performances in the future. The smelting of to-day is a vastly different thing from the smelting of a half a generation

receiving \$50,000 cash—all of the balance was paid from the royalties from the leases. On Jan. 1, 1902, the purchasers took possession and the new regime with its systematic development began.

The immediate country is covered with an eruptive rock, the older formation showing in but a few places, on one of which Butler located these properties. At first it seems to have been the impression that the entire mineralized area was confined to these claims. Nevertheless, all of the surrounding territory was located and companies were formed to explore the outside territory. The Tonopah Mining Co. has not merely one ledge, and one mine, but a system of veins and ledges. The Tonopah Fraction Co., the Salt Lake Co., the Montana Tonopah Co., the Mizpah Extension Co., the Tonopah Belmont Co., all report having found ore. Many more companies are sinking in all directions, and farther and farther away, and gradually the working area is extending. These companies are, as a rule, well financed. The great problem at present is the treatment of the ore. The cost of shipping to smelters and treatment charges is greater than the estimated cost of treating it on the ground will be—but this latter requires that water and electric power be brought in at an expenditure of a large amount of capital. There was a time when this looked serious, because of the great amount of money necessary to be spent to bring in the power and sufficient water for milling, but as more ore was opened up the difficulty grew less, until now it is but a question of how soon. The Tonopah Co. has proceeded carefully with what has seemed to some a too slow and careful policy, shipping only enough to meet expenses while developing. The town, like all mining camp towns, not only has kept pace with the development of the mines, but is a little ahead of them—it is now a town of about 4000 people, with plenty of good water for domestic purposes, an electric light plant, water works, two newspapers, a stock exchange, good hotels, stable, banks, and with healthy and salubrious climate.

Two railroads are being surveyed, and two companies are in the field with promises of water for all purposes and electric power lines. The neighboring camps are Ray, 12 miles, with a mine shipping; Gold Mountain, 6 miles out, with at least one property with shipping ore; and Hanapah, Lone Mountain, and several others, all having more or less showing. But it would seem that Ray, Gold Mountain and Lone Mountain are of the most importance.

Assaying Cyanide Solutions.

Written for the MINING AND SCIENTIFIC PRESS by
R. STUART BROWNE.

Of the many ways of assaying cyanide solutions by precipitation, that by means of acid, copper sulphate and a soluble sulphide is the most valuable. This method is due to Prof. S. B. Christy, who first suggested it in 1893. So far as I have been able to ascertain, no investigations have been published regarding the conditions necessary for accuracy when the method is used. From my own experience and observation in different laboratories, I was convinced some time ago that the results obtained by this method are variable, according to the different conditions under which the precipitation is made. The practice of acidifying the solution after the copper sulphide is thrown down is wrong. The solution should be made acid the first thing and boiled two or three minutes to expel the hydrocyanic acid. Either hydrochloric or sulphuric acid is satisfactory for this purpose. If the acidification is made last, the precipitation of the gold and silver is incomplete, unless an excessive amount of copper sulphate is used. This gives rise to another question: What part does the copper sulphide play in the precipitation of the gold and silver? Is it a precipitating or collecting agent? Both gold and silver are thrown down as sulphides from an acid solution by the addition of a soluble sulphide, and it is quite probable that this is the form in which they are precipitated, and the copper sulphide simply serves to gather them. It is well adapted for this purpose, but has the disadvantage of being easily reduced to metallic copper, and as such it enters the lead button and causes an excessive cupellation loss. It must, therefore, be used in as small a quantity as possible. From a large number of experiments made with varying quantities of copper sulphate I found that one gram of the crystallized salt would give perfect results and check exactly with carefully made evaporation assays. One and a half grams also gave good results, but when two or more grams were used the figures were always low. This was probably due to the effect of the copper on cupellation. In another series of experiments an excess of copper sulphate was added, only a portion being thrown down as sulphide. The results were low in every case, the cause of which I am at a loss to explain.

The particular advantages of this method of assaying are, that it permits of a large sample of solution being taken, and is extremely rapid. The most convenient apparatus for boiling and precipitating the solutions in are agateware saucepans holding about half a litre. Unfortunately they are not very long-lived, as the chemicals soon destroy the enamel and holes are formed. Laboratory lamps or coal-oil stoves should be used for boiling in preference to the

TONOPAH, NEV. MARTIN 1903 E. V. SMITH PHOTO.

TONOPAH, NEVADA.

true not only of lead, lime and iron ores, but at times when an acid flux is desired, the same is true of hard white quartz. The actual cost of smelting is another matter, and varies according to the locality. The cheapest smelting within my knowledge that has ever been done on this coast is being carried on at Keswick, Cal., of course by the pyritic method, which by its faculty for making fuel and flux out of sulphides, is best adapted for very low costs. This, according to data published in the latest volume of the Mineral Industry, was 69 cents per ton, for the three items, coke, wood for heating the blast, and labor. If the additional items of interest on plant, depreciation, repairs, sinking fund, fluxes and general expenses are added, the cost would probably reach a little above \$1 per ton of charge, which is extremely low and compares very favorably with the cost at any smelting works, even the most favored. Six years since I conducted the same sort of work, namely pyritic smelting, at the same locality, and by a curious coincidence, used the same proportion of fuel (2½% on the ore) and made up the charge in a very similar manner. The resemblance between my work and the present extended even to the grade of matte produced, which assayed 19% copper in each case. My cost per ton, counting all the items, including interest and a proportion of the general expenses, was \$1.63 per ton; at that time the lowest figure reached upon the coast, or perhaps anywhere in this country.

At Boundary, B. C., the cost per ton, at one smelter, we are informed, is but \$1.35, which, considering the disadvantageous locality, the condition of the labor market and other circumstances, is exceedingly, almost incredibly, cheap. These three ex-

ago, but the difference is as much or more in the men as in the machines and processes. The happy-go-lucky furnace manager of the past, who was so fond of calling himself practical, has gone from among us, and his place knows him no more. It has been taken by a younger man, of scientific education and training, who brings all the resources of the day to aid him in his work, who keeps up with the times and exchanges ideas and information with the rest of the world. The modern engineer has found, what his predecessor has not, that there are no secrets in metallurgy, no accidental blundering on to combinations, but just a strenuous working out of results by the rules of chemistry and common sense. Smelting of copper is taking its place along with the other scientific operative arts from which the world receives and to which it gives so much.

Tonopah, Nevada.

A little more than two years ago there was nothing where Tonopah now stands. It was about the last of August, 1900, that J. L. Butler located the Mizpah, Sand Grass, Red Plume, Buckhorn, Burro, Desert Queen, Silver Top and Valley View claims, where croppings appeared on the surface, but it was not until the following year that active work was done. During the summer of 1901 a number of leases (over sixty in number) on portions of the group were given, some of whom commenced taking out ore from the surface. These leases expired Jan. 1, 1902, and were all verbal. From these leases up to Jan. 1, 1902, came a large production, which gave Tonopah its first fame. Meantime, in July, 1901, Butler had sold to Philadelphia people for \$336,000,

top of the assay furnace. A too rapid generation of heat will cause the solutions to run over with attendant loss. The following is a general description of the method of conducting the assay. The solution is measured out in quantities varying from three to ten assay tons, according to its richness, and brought to boiling. It is then acidified so that it gives a strong reaction with litmus paper. At the end of two or three minutes, twenty cubic centimeters of copper sulphate containing one gram of the salt in solution are added by means of a pipette. As soon as this boils a slight excess of either sodium or potassium sulphide is added to precipitate the copper. The boiling is continued for another minute, or until the evolution of hydrogen-sulphide ceases. Filtration is then made through an eleven-centimeter filter. Some of the precipitate will adhere to the sides of the saucepan and must be removed with a little cold water and rubbing with a finger. After filtering, the precipitate is folded up and placed in front of the muffle in a 2½-inch scorifier. It dries very rapidly and the paper soon catches fire and is consumed. The sulphur also burns and is driven off. Granulated lead and a small amount of borax glass are then added and the whole scorified. As there is very little material to slag off, twenty grams of lead will usually suffice. It is advisable to scorify the button until it is reduced to eight or nine grams. It is then extracted, cupelled and the values calculated. In making the assays considerable time can be saved by boiling three or four solutions at a time. Another way of saving time is to use standard solutions so that the necessary amount of reagents can be added without any unnecessary delay. In this way fifteen or twenty solutions may be prepared for scorification in about three-quarters of an hour. In adding the alkaline sulphide care should be taken not to add in such excess that the solution becomes alkaline again. As soon as all of the copper has been thrown down an excess of sulphide gives a white precipitate of sulphur. This, however, cannot be seen unless the copper sulphide has settled somewhat. Regarding the accuracy of the method, there is no question but that if properly made the results are fully as high as those obtained by any other means.

Mining and Metallurgical Patents.

PATENTS ISSUED MARCH 31, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

CENTRIFUGAL ORE CONCENTRATOR.—No. 723,932; P. H. Shue, Ouray, Colo.

Centrifugal ore separator, combination, inner and outer rotatable casings spaced apart with free passage between them and at discharge end, inner casing having separating openings, ore feed into inner casing, and wash water feed into space between casings.

MULLER FOR GRINDING OR AMALGAMATING MILLS.—No. 724,019; E. F. Knotts, Des Moines, Iowa.

In muller, combination of circular body portion having circular opening in central portion thereof and series semicircular openings midway between circular opening and exterior of body portion, body portion also having square-shaped perforation at rear of each semicircular openings, sides to perforations beveled from minimum distance between them at lower edges to maximum at upper edges, shoes for muller, projection on upper surface of each of shoes

extending upwardly from shoe to which attached, beveled sides for projections to hold shoes in place relative to body portion when placed in perforations, pins for detachably connecting shoe with body portion.

DUMP CAR.—No. 723,921; J. B. Rhodes, Harvey, Ill.

Dump car, comprising truck and tilting body mounted thereon, displaceable side boards, props for producing displacement, sliding connections intermediate of props and side boards, whereby either board free to have slight downward movement with body before displacement produced, and locking devices applied to lower edges of boards adapted to release latter during sliding movement between props and boards, whereby either board unlocked before displacement takes place.

COPPER LEACHING PROCESS.—No. 724,414; G. H. Waterbury, Denver, Colo.

Copper leaching process, consisting placing suitably pulverized ore in tank, adding acid, salt, oxide manganese and water in suitable quantities, heating mass to desired temperature, subjecting pulp to agitation until copper has been dissolved.

APPARATUS FOR EXTRACTION OF PRECIOUS METALS.—No. 724,076; J. B. de Alzugaray and W. A. Mercer, London, England.

Apparatus for treating ores comprising lead-lined vessel capable of being hermetically closed provided with gage glass and filling device, vertically adjustable air-inlet pipe, outlet pipe provided with inspection glass and means for agitating contents of vessel.

ORE CONCENTRATOR.—No. 723,865; F. W. Harlow, Eureka, Colo.

Ore concentrator having pan mounted swing, actuating device for pan, adjustable controlling device controlling stroke of pan, and governor driven in unison with actuating device automatically adjusting controlling device, and wedge-shaped bumper mounted on slide and adapted to be engaged by bumper block of pan, movement of bumper controlled by governor.

DRILL FOR BORING WELLS.—No. 724,160; W. H. Clark and F. J. Currier, San Francisco, Cal.

In drill, combination, with drill proper, of plate around stem of drill, upper plate, rods connecting plates, levers pivotally supported by upper plate, hammer for driving drill, and provided with means for rocking levers by reciprocation, ratchet wheel for rotating drill, and means rotating ratchet wheel.

PROCESS OF SEPARATING COPPER FROM ORES.—No. 723,949; G. D. Van Arsdale, New York, N. Y.

Separating copper from cupric-sulphate solutions, with or without ferrous or other suitable sulphate and simultaneously producing free sulphuric acid, by adding sulphur dioxide and heating with or without pressure, whereby copper or copper compounds thrown down in solid form, to be subsequently treated, and free sulphuric acid formed and adding acid liquors obtained, after separation from copper precipitate, to copper ores, whereby copper contained is dissolved and original solution regenerated and process repeated.

In the issue of March 21st appeared an illustrated account of the manufacture of Portland cement in California, wherein extended reference was made to the plant of the Pacific Portland Cement Co., and the aerial tramway therein described. Further information is received to the effect that the tramway, which is automatic and efficient, is of the manufacture and build of the A. Leschen & Sons Rope Co., St. Louis, Mo.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence).—The Nome district is progressing favorably in its winter diggings. Anvil and Dexter creek benches, it is estimated, will produce more than \$500,000 as their share of the winter output. Peeluk and Martin's creek claims are good for \$50,000, Bourhon and Dry creek benches for \$100,000. On Solomon river a paystreak of 3 feet, averaging 25 cents to the pan, has been found on No. 7 below, and a big winter dump is being taken out. On Mystory creek, tributary to Solomon, seven claims are being worked and a good result is promised. A quartz claim is being developed on West creek, a tributary of Shovel creek, \$8 ore being taken out. Daniels creek benches are being worked extensively, with good pay. Ophir creek benches are also being worked, but less than last winter. It is a summer camp and can be more economically worked by sluicing. On the Inmashuk river, flowing into Good Hope bay, some good prospects were found during the fall and a stampede is expected next summer to that region.

The town of Nome has undergone some transformation since last fall. A number of empty cabins and houses have been moved to the creeks adjoining Nome, so that more people are living on their own claims than during any previous winter. This makes business in the town dull, but it is evident that the adjoining territory is being developed. There are 500 people in the Good Hope district, camped on claims, which are being prospected or which will be worked early in the spring. A large number of laborers will be in demand next summer. Great activity is evident among the mining companies represented here. Some are transporting supplies, machinery and lumber to their claims; some, like the Alaska G. M. Co., are prospecting the beach and the sands of the Bering sea ½ mile off shore. The manager claims to have found prospects which justify the erection of sand pumps on the ice until the drifting out of the ice from shore.

Open gambling in town has been stopped by order of the Department of Justice at Washington.

Lumber is scarce here, especially 2-inch planks. The winter has been very cold, as low as 50° below zero a few days ago. The first mail of the season has arrived. Nome, Jan. 26.

(Special Correspondence).—The first mining we found after leaving the steamer was at White Horse, Yukon district. There we were shown some samples of copper ore, said to run as high as 47%; saw the croppings on the trail to Dawson, about 4 miles out of White Horse; was told that one lot of 100 tons sampled 12% copper. It all carries some gold and silver. A shipment of 180 tons was sent out from the Glatfer mine.

The Transportation Co. and smelter at Crofton, B. C., have made a rate of \$10 per ton from White Horse. Lack of funds seems to be in the way of any extensive development.

On our way down the Yukon we saw extensive gravel deposits, all said to carry some gold, but do not think enough to pay here. I have seen some of the crudest and most expensive methods for handling gravel here ever invented. All estimates here are so many cents to the pan. There is a small amount of mining on El Dorado and Bonanza creeks. I was informed that it will be the smallest production of any season in the history of the Klondike.

After we left Forty Mile, on the Yukon, we saw fifty men "burning ground," as it is called on the Forty Mile river. Some were making wages, some not even grub. In some places the gravel was 6 inches and in others 2 feet—all shallow.

All the gold I saw from Forty Mile was fine—no nuggets over 50 cents. At Steel creek I saw some fine nuggets from Jack Wade creek, the largest \$300 and a lot of \$2 to \$10. Saw some fine quartz and gold from Chicken creek—about ½ inch stringers; looks like California pocket quartz; only a pocket, so far, on Chicken.

Indications are favorable for some good quartz discoveries in this country. Our camp is ½ mile from the main trail to the Tanana, the Mecca of all stampedeers now. They pass here singly, in pairs, and in droves, in all kinds of conditions—hand sleds, dog sleds, mules and horses. Some of the most brutal sights are seen here; some men abuse and starve their poor dogs and horses shamefully. All reports here so far are that it is good pay—a lot of gravel, no big bonanzas.

I think enough men have gone in this

winter to stake the Tanana and all its tributaries.

Eagle City, March 15.

Manager R. Day of the Mansfield G. M. Co. is putting up an hydraulic plant and a sawmill on McGinnis creek, near Juneau.

The Alaska Petroleum & Coal Co. are operating at Galiano, in Kyak district, 100 miles east of Valdez, says Manager Lippy. Their holdings are on the mainland, opposite Kyak island.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The Marquette & Arizona M. Co. is erecting a 25 H. P. hoist on its property and sinking the shaft, now down 100 feet. Ore runs \$19 gold and 4% copper; have about ten tons on the dump. E. Marks is manager. Bisbee, April 1.

The Tombstone Con. M. Co. at Tombstone report the 700-foot level station in the shaft timbered and drifts started. The pumps are handling 1,700,000 gallons of water per day. They will open up other claims in their group.

The Mitchell Dev. Co. have begun work on their group in the Huachuca mountains, near Bisbee. A tunnel is being run to connect with the main shaft and ore is being opened up.

COCONINO COUNTY.

H. J. Beemer of the United States G. & P. M. Co. says the company will hereafter make Williams, instead of Seligman, the point from which all operations will be carried on.

GILA COUNTY.

Superintendent E. H. Benson of the Black Warrior C. Co., Amalgamated, near Globe, says the leaching plant will be in operation next week.

MARICOPA COUNTY.

J. A. Wishart has men at work near the upper box canyon, near Wickenburg, testing the gravel beds and mesas for placer gold preparatory to putting in a steam shovel. A well is being sunk on the bank of the river and a gasoline engine and pump set up.

MOHAVE COUNTY.

At the Chumax mine, near Kingman, Super J. Dundon reports opening gold ore, averaging 10% copper and \$30 gold per ton. Water is coming in the shaft and machinery will have to be put in. Manager S. C. Bagg, at the New Comstock mill, is getting things in shape for a run.

PINAL COUNTY.

Superintendent F. Brownell of the Producer Co., near Casa Grande, says machinery for a steam hoist, air compressor, boilers and a portion of the 50-ton smelting plant is on the ground.

Superintendent J. T. Garrison reports finding a body of silver ore in one of the Siggins copper claims, 1½ mile above the headgate of the Florence canal, says the Florence Blade. He is down 40 feet on the vein and the entire shaft shows silver glance, which also carries some copper.

The Arizona-Pacific C. Co., composed of Indiana men, are operating the Ritsch-Henry mines near Florence, and a steam hoist is being put up, says J. W. Sharpe, vice-president and manager.

SANTA CRUZ COUNTY.

The Mercedes C. Co. has incorporated at Nogales; O. K. Franklin, H. A. Smith and J. Dessart.

YAVAPAI COUNTY.

The Denver Onyx & Marble Co. is reported to have bought the D. Bowen onyx claims at Mayer. They will begin operations next week and put in machinery to prepare the stone for market.

The Poland mill at Poland is reported closed down, throwing 100 men out of work. Although the company proposes changing the process of treating ore, it is said that the close down was decided on principally as the result of the eight-hour law passed by the last Legislature.

J. Elder of the Geo. A. Treadwell Co., near Jerome, says that at the Brookshire group the principal work being done is driving the tunnel, which will be continued another 100 feet to tap other workings. A diamond drill will be put at work.

G. Scammel, superintendent of the Hassayampa Dredging Co., says a dredger will be put on their placer claims on the Hassayampa, above Walnut Grove. It will have a capacity of 1000 yards daily. The company estimates that the dirt will yield 50 cents per yard. Water will be pumped for washing the dirt until the water level is reached with the dredger.

The first time in many months the United Verde has been unable to secure all the men it needed occurred last week, says the Reporter. The fourth of the

small furnaces was blown in and the high furnace is ready for operation.

Superintendent Pickereil of the Gold C. Con. M. Co. has his shaft on the Rockefeller mine of the President group, 12 miles south of Prescott, down 620 feet. The 10-stamp mill and the 50-ton cyanide plant were started up this week. The ore is a sulphide and carries \$30 per ton in gold. He has thirty men at work.

At Mayer a strike is reported made in the French Lily in Crazy Basin district, under bond and leased to G. W. Middleton. In the drift on the 200-foot level a body of ore has been struck assaying 15% copper and \$35 in gold.

J. R. Thomas of the Black Hills & Minus C. Co., near Jerome, says, at the Black Hills, machinery has been put in and sinking resumed. On the Minus one shaft has followed the ore down 100 feet and they are crosscutting at this point. The rock assays 7% copper, with values in gold and silver.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The report is current that the miners have decided to insist on the recognition of the union. Several meetings have been held with representatives of the Western Federation of Miners, who have advised the union men how to proceed. They intend to demand an increase in wages.

There are about 1200 miners in Amador county, of whom a large number are members of the union, and others will be compelled to join or they will not be allowed to work. There is a possibility of the strike extending throughout the several Mother Lode counties before a settlement is reached.

W. F. Detert, superintendent of the Zella mine at Jackson, D. McClure, superintendent of the Gwin mine in Calaveras county, and John Ross, Jr., superintendent of the Wildman-Mahoney mines at Sutter Creek, have been appointed to formulate a reply to the demands of the miners. This will be done within a week. What the reply will be has not been made public, but it is believed that as the present condition of most of the mines will not justify an increase in wages or a decrease in working hours, that the demands of the Miners' Union will be refused.

Jackson, April 8.

A committee of the Jackson Miners' Union waited on the superintendents of the Zella, Kennedy, Onaida and other mines last week with a written statement of demands which includes recognition of the union, reduction of the working day to eight hours and the reinstatement of men alleged to have been discharged because affiliated with the union. The companies are given ten days to consider these demands.

CALAVERAS COUNTY.

(Special Correspondence).—The Pioneer Chief mine, near San Andreas, which was recently bonded by Dr. Foster of New York City, is to be reopened. The mine was developed to a depth of several hundred feet, but has been idle many years. The vein, which is found at contact of greenstone and slate, contains much calcite with quartz and iron sulphides.

The Calaveritas hydraulic mine, 2 miles north of Fourth Crossing, is in operation under direction of Dr. Nelson, who bought the property last fall and has spent a large amount in its equipment.

San Andreas, April 5.

The Vornich M. Co. has been incorporated to operate the mines of the Vornich Bros. on Bear mountain, about 5 miles from Angels. One shaft is down 125 feet. A hoist will be put up and the shaft sunk to 600 feet.

KERN COUNTY.

(Special Correspondence).—The 10-stamp mill of the Echo M. Co. of Los Angeles, Cal., 5 miles west of the village of Mojave, is running steadily on good ore. A cyanide plant is being built to work the tailings direct, there being no intermediate concentration, all the ore being oxidized. At the Queen Esther mine, near the Echo, a 100-ton roller mill is being put in.

Mojave, April 7.

The Associated Oil Co. will erect a 250,000 barrel reservoir at McKittrick. The Southern Pacific Oil Co. began pumping two new oil wells last week and expect to sink twenty-five more wells this season. The Standard Oil Co. is erecting four reservoirs at the Kern River field, near Bakersfield, a capacity of 350,000 barrels each. They will be 300 feet in diameter.

The Fulton Oil Co. has incorporated to operate at Sunset; G. Bradley, R. L. Mann, R. W. Hart, B. Romains of San Francisco, and S. Maine of Bakersfield.

Manager J. R. Johnson is reopening the St. Elmo group of mines, 5 miles from Randshurg. A gasoline engine has been

put in and a cyanide plant is proposed.

W. F. Ernst has leased the Plunmore mine and mill, near Johannesburg, and has men at work.

The War Eagle M. Co. has opened up a large body of low-grade ore in the bottom of the shaft, the ledge dipping nearly vertical, says Superintendent Castro. The War Eagle adjoins the Yellow Aster, near Randshurg.

LOS ANGELES COUNTY.

The California D. & E. Co. has incorporated at Los Angeles, A. E. Clark, G. O. Pearce, E. D. Bryant, J. Binney, L. Stair, H. H. Sheffield, W. J. Bryant, J. M. Brown and J. M. Cummings, to build and operate at tide water near San Pedro a smelter with daily capacity of reducing 1000 tons of ore.

MARIPOSA COUNTY.

Work has resumed on the Pine Tree tunnel to develop the Pine Tree and Josephine mines near Bear valley. Men are at work cleaning out and retimbering the tunnel which begins at the Benton millsite. It is in 2000 feet and will be driven ahead to tap the ledge.

H. C. Austin et al have bonded the Dusenberry claim at Whitlock. They intend to put in a gasoline engine and pump.

MONO COUNTY.

The Standard Con. M. Co., at Bodie, are overhauling their cyanide plant and expect to resume next week.

NEVADA COUNTY.

For the past three months the Le Compton M. Co. has been working on a 2 foot ledge of ore, 1 foot of which assays \$200, says W. H. Dunlap, president and manager. The remaining 12 inches runs \$20 per ton. The mine is on Deer creek, 3 miles from Nevada City, and has attained a depth of 420 feet, the country rock being granite. The ore is free milling and carries sulphides. The mill handles only the lower grade rock, the other being shipped to the smelter. Five more stamps will be added to the mill and heavier pumps put in at the shaft this spring. There are twenty-seven men on the payroll.

President J. D. Hague of the North Star M. Co., near Grass Valley, in his annual report says the important development of the year has been the opening up of an ore shoot on the east 1100 foot level of the old workings. This ore body is shown to be 100 feet in length along the course of the vein, extending downward from 1100 to 190-foot level (45 feet on dip of vein), and thence continuing below the 1900, where sinking has been started. The deeper working from the Central shaft indicates the continuance of this ore body below the present showing in the 1100-1900 block. From this block there were mined during the year 7204 tons of ore, yielding \$43.76 per ton, at a cost of \$9.48 per ton. The vein area, about 16,000 square feet, worked out in mining this ore, is one-third of the estimated vein area of the ore body above the 1900. During the year there were mined from the deep workings of the Central shaft 10,195 tons of ore, yielding \$9.40 per ton, at a cost of \$3.42 per ton. The total value produced from the mine amounted to \$411,147.98, with operating cost of \$154,227.66 (an operating profit of \$256,920.32, which has been sufficient to cover outlays during the year on development and equipment accounts of \$112,395.47).

A 20-inch ledge of high-grade ore is reported struck in an upraise from the 20-foot level of the Eddy mine. The Eddy is an extension of the Pennsylvania, and is on Cement Hill ridge, northwest of Nevada City. W. W. Kirkham is president and manager.

C. G. Mitchell has found pay gravel on his ranch, near Grass Valley, and has begun placering, with several men at work.

Superintendent Cassaway of the Union Blue Gravel mine at North Bloomfield is making preparations to add ten stamps to their 10-stamp mill this spring. He has fifty men at work. A locomotive is used in the main tunnel hauling twenty-five loaded cars to the mill each trip.

Superintendent C. A. Brockington of the New Orleans mine, near Grass Valley, says they have struck the Hueston Hill vein for which they have been prospecting for some time. At the 700-foot level a crosscut was run into the footwall and a raise driven on a water course opened, and at 165 feet from the crosscut the vein was found, showing 6 feet with values in free gold, galena and pyrite.

SAN DIEGO COUNTY.

The Picacho mine, near Yuma, made its first shipment of gold bullion last week, being two bars worth \$40,000, says the Citizen.

SACRAMENTO COUNTY.

The Blue Ravine M. Co., near Folsom, are operating a driller, prospecting new ground near the present mine.

SAN BERNARDINO COUNTY.

Placer gold is reported in the Sacramento wash near Needles. It is a dry wash proposition, and a rush has taken place to the district. A find is also reported near Black's Peak, 45 miles from Ilex, the strike being made by H. Butler and G. King while looking for oil prospects. This is also in the Sacramento wash, and northwest of Needles.

The sale of the Bagdad mines at Ludlow is off, the bond lapsing. The Bagdad M. & M. Co. retains the property. The mines are 8 miles south of Ludlow, on the Santa Fe road, below Barstow. A railroad has been started from Ludlow to the mines, called the Ludlow and Southern. Work at the mines has stopped and the mill at Barstow, owned by the company, will be overhauled and additional machinery put in. E. H. Stagg, of Johannesburg (Kern county), is manager.

SAN DIEGO COUNTY.

The California Q. M. Co. has incorporated at San Diego; J. M. Steade, E. Booker, O. G. Douglas, H. A. Croghan, C. Myers, C. E. Anthony and E. Daney.

SHASTA COUNTY.

Work has been resumed on the power plant to be installed by the Northern California Power Co. on Cow creek, near Redding, which was suspended as a result of the strike at Iron Mountain and Keswick, says Superintendent E. V. D. Johnson.

Superintendent Scott of the Great Western G. Co., operating the Afterthought mine, near Bella Vista, says machinery is arriving on the ground for the smelter and power house. An air compressor and power drills are being put in. At the mine on the No. 2 level the shoot opened up is showing 10% copper, \$5 in gold and 100 ounces of silver per ton.

Redding reports ten mining locations filed for the week ending April 4.

There are now at the Iron Mountain mine 260 men, and at the smelter 390, working for the Iron Mountain Copper Co. Another furnace has been blown in and the converters started.

SIERRA COUNTY.

The Red Ravine gravel mine at the head of Nelson creek on the line between Sierra and Plumas counties, near Downieville, is reported sold to a San Francisco company, D. Jones of Downieville, superintendent, for \$50,000. A tunnel will be run in to cut the channel and a sawmill will be put up.

SISKIYOU COUNTY.

The Condrey quartz mine on Klamath river at Riverside, near Yreka, has been bonded to Manager Johnson of a San Francisco company for \$80,000. Whitney & Co. have begun work in a placer claim below Riverside on Klamath river, to be worked by the hydraulic elevator. Carlock & Morrison have their quartz mine in good shape again since the fire of a month ago. The machinery was but slightly damaged. The pumps were kept in operation to prevent the filling of shafts until the buildings were rebuilt.

At the Double Eagle mine on Barkhouse creek near the Commodore mine, near Yreka, being worked under Quigley & Barton, the owners, 900 feet of drifting and tunneling has been done during the winter.

With the electric power plants in operation the coming summer, it is expected the Greenhorn blue gravel mine, near Yreka, will be reopened, as the expense of pumping the water will be greatly cheapened, firewood for steam being high.

TUOLUMNE COUNTY.

The Olson mine, near Cooperstown, has shut down, says the Magnet.

At the Prudhomme mine, near Carters, the ore chute is being opened up and run on the 300-foot level, north and south. The company will sink an additional 200 feet and add five stamps to the mill, says the New Era.

The Violet quartz mine, adjoining the Cosmopolite mine, has been bonded to J. Chapman of Groveland for one year.

The Mt. Lily mine, near Sonora, has been compelled to shut down temporarily on account of a cave and water coming in at the upper tunnel.

To J. R. Middlemiss of New York and L. M. Cutting of Stockton has been deeded in trust for the Rawhide Chief M. Co., the Black Slate and Tappi lode claims, 1 mile north of the Rawhide mine, near Jamestown, including all improvements, for \$5000.

The Mountain Belle and Parallel mines, at Soulsbyville, north of the Soulsby mine, were sold last week to W. Sharwood, who has been working them for the past three months.

It is reported in the Little Bonanza pocket mine, at Sonora, a rich pocket is being taken out. The mine is under lease to E. & A. Deleray, A. A. Grant and D. R. Oliver.

VENTURA COUNTY.

C. A. Burrows finished up a well in Wheeler canyon, near Fillmore, last week, which gives fifty barrels per day. After a shut down of two months the Sespe Canyon Oil Co. have resumed work on their lease. The Tapo Oil Co. has a lease on the Sutherland Hutton ground, near Buckhorn, and has begun drilling. The Sulphur Mountain Petroleum Co. of Fullerton (Orange county), drilling on Sulphur mountain, near Fillmore, has brought in a well at a depth of 2000 feet. Work has resumed on the Northern Oil Co.'s ground under lease to the Seaboard Con. Co. of Chicago, Ill.

COLORADO.

BOULDER COUNTY.

A hoisting plant has been put up on the Golden Eagle mine, near Eldora, and development work begun.

A bond and lease has been given on the Cream lode, near Eldora, to J. Luxon, J. L. Misner, M. Meyer, L. Algire and C. Gilbert of Boulder. There is a tunnel in 400 feet and a shaft 75 feet deep. The Cream lode adjoins the Melvina on the east.

The Boulder Illuminating Oil Co., owned by W. P. Bonbright et al. of Colorado Springs, has begun pumping its well near Boulder. This well is near the Otero and the Savannah.

At the Wood Mountain mill, near Wall Street, the stamp battery is in operation and a Huntington mill is being put in, which will give them a capacity of 100 tons per day. They are milling ore from 150 feet below Four Mile Creek bottom. J. J. Morris is superintendent.

A. Brown, manager of the Wano M. Co. at Jamestown, says his company will build a cyanide mill of fifty tons daily capacity at the mine. The vein on the Wano is 40 feet wide, average value \$10 per ton.

CHAFFEE COUNTY.

The management of the St. Joseph G. M. & M. Co. expect to start work on their group near Granite next week. The Magenta shaft will be cleaned out and sunk deeper, and at the same time work will be started on the Emma claim and the Magenta mill will be put in operation.

It is reported the New Year's mine at Granite, operated by the Elkins M. & L. Co. of Cripple Creek, has opened a vein of ore, 3 inches of which are running twenty-five ounces per ton in gold.

CLEAR CREEK COUNTY.

The report of the secretary of the Empire Tunnel Co. at Georgetown for March shows with two machine drills the tunnel was driven 186 feet during the month at an average cost of \$10.39 per foot. This tunnel is an 8x8 foot, crosscut in 2040 feet, being driven through granite. To break the rock an average of eighty-four pounds of powder were used each day.

At the Waldorf mine, near Georgetown, it is proposed to erect concentrating works at the mine and to increase development, says Manager E. J. Wilcox.

Work on the Wilcox tunnel, near Georgetown, during March advanced the face 180 feet, making a total of 1380 feet.

Sinking was resumed at the Russell mine, near Russell gulch, last week at a depth of 235 feet, and will go down at least 100 feet deeper. Cleveland, O., parties are interested and A. Thompson is superintendent.

DOLORES COUNTY.

At the Emma group of mines, 1/2 mile below Dunton, thirty stamps will be added to the 20 stamp mill. During the past year the mine and mill have been employing 125 men, the output being 150 tons of mineral daily. With the addition they expect to reduce 300 tons per day. The 3000 feet of vein matter on the Emma has been opened by five levels. R. Keller of Dunton is manager.

Near the Emma mine, near Dunton, the Mount Gorman group, owned by a Milwaukee company, the 10-stamp mill is in operation, and it is proposed to increase it to 20 stamps.

EL PASO COUNTY.

The United States R. & R. Co. say work will be started next week on the chlorine gas plant to be erected at Colorado City in conjunction with their Standard and Colorado plants. A second chlorine plant will be erected at Florence in connection with the United States plants at that place. The cost of each unit will be \$50,000. By means of this plant chlorine is manufactured electrically at a saving over the present method of using lime and sulphuric acid. The patents to the new process are owned by the United States Co.

FREMONT COUNTY.

The Lohach Oil & R. Co. was organized at Florence last week and will operate in the Frazar orchard. Drilling will begin next week. A. Gullinger is manager.

GILPIN COUNTY.

A local pool at Central City has a lease on the Wood group in Leavenworth gulch which has produced uranium ores. It has been idle for three years. Shipments have been made to Europe, the ore averaging 20% uranium. Further development work will be done.

Work has resumed on the tunnel proposition of the Swiss G. M. & R. Co. at the head of Moon gulch, near Rollinsville.

At the Saratoga, near Central City, a new "boh" for the Cornish pump has been put in at the 800-foot level. An assay office building has been erected and equipped.

The Oro Verde M. & M. Co., J. C. Williams of Chicago, Ill., vice-president, is operating between Silver creek and Mammoth gulch, near Central City. An 18 foot vein has been opened up on the 800-foot level. The company intends to put in an air compressor next summer and the main tunnel driven ahead to cut the veins exposed on the surface. G. P. Goodier is superintendent.

The Seaman tunnel has been started in from Fall river, near Yankee, to run through the Yankee district to cut a group of claims. The tunnel will be 8x8 feet in the clear, with double tracks.

The Grand Central Co. of Colorado City, which owns the East Whiting mine at Central City, has decided to build a 15-stamp mill to handle its low-grade product. On the third level the vein is 6 feet wide, the smelter product averaging \$30 a ton and shipments ten tons a day. The low grade runs \$7 a ton. The main shaft, which is 480 feet deep, will be sunk to 680 feet, and new levels run out to open the vein at each 100 feet, says Manager H. D. McMasters.

HINSDALE COUNTY.

Work has been resumed by the Henson Creek L. M. Co. near San Juan. The hoist and power plant were completed in February, but work was temporarily suspended on account of the heavy snow. The mill is expected to be finished by May 15.

LA PLATA COUNTY.

The plant of the American S. & R. Co. at Durango is being enlarged. It is at present treating an average of 300 tons of ore and concentrates daily, and this will be increased to 450 tons.

LAKE COUNTY.

The Denver Times says an encouraging feature in the present mining conditions at Leadville is the increased demand for oxidized iron material, and as a result there are a number of properties enabled to ship that for some time have been idle. Also, it is reported the Republic smelter, controlled by the same parties which own the Salida plant, will be remodeled and operated as a pyritic smelter, handling a lower grade material than that now smelted.

The Sharp G. M. Association, near Leadville, are down 70 feet in shaft No. 5, and in the first porphyry overlying the lime. They have not found hand power sufficient to push the work as fast as they desire and will install an engine and boiler.

The News-Dispatch says the destruction by fire of the Canon City smelter has been a serious inconvenience to a number of the mines around Leadville, from which zinc-lead ores were being shipped.

At the Valentine mine, near Leadville, Manager Shadbolt says they will put down several drill holes south of the shaft to locate the ore body. One drift south of the shaft has been driven 150 feet.

The Yak tunnel, driven in from California gulch, near Leadville, last week, cut the drill hole sunk from the bottom of the Ibex shaft, draining the Ibex workings.

The Blue Ribbon shaft at Leadville is being sunk by lessees and has reached the blue lime at 120 feet. Water is coming in, but they expect to be able to handle it with a bailer until they sink another 50 feet. At 150 feet they expect to strike the ore channel.

Manager Brooks says he will begin operations next week on the Vega shaft, owned by the Vega M. Co., and joining the Diamond M. Co. on the northeast, near Leadville.

T. Kyle, manager of the Boulder mine in Big Evans gulch, near Leadville, struck a heavy flow of water in the new shaft last week. When down 410 feet the sudden influx of water drove the miners out of the shaft. It rose to an adit 40 feet below the surface.

The Breece Hill cyanide mill at Leadville has had additional rollers and pipes put in and resumed this week.

SAGUACHE COUNTY.

The Crown Point M. & L. Co. has incorporated; F. M. Symes, D. J. Carlin, T. C. Brown, F. Eakins, J. G. Huntington and F. M. Woods directors. They have a three-years' lease on the south 750

feet of the Crown Point, Klondike and Homestake lodes of the Central Colorado G. M. Co. in the Klondike (Finley gulch) district, 9 miles north of Saguache, and have begun operations. The Daisy Dean shaft has been unwatered and is being enlarged to 8x4 in the clear. At the 200-foot level a crosscut will be run to the Klondike shaft. A gasoline hoist will be put in and a mill later on.

SAN JUAN COUNTY.

Superintendent Lonergan of the Wabuse M. Co. in Hematite basin, near Silverton, says the 100-foot winze sunk from the Little Annie tunnel is finished and a drift from the bottom has cut 28 feet of milling ore. The group will be developed by tunnels to greater depths and a mill will be erected.

A. V. Shaw and A. W. Degenhart have a three-year lease on the Boston-Auburn Co. group on Tower mountain, near Silverton. They have two veins of ore carrying lead, silver and copper, and propose building a tram from the property, a distance of 1/2 of a mile, to the railroad near Middleton.

It is reported the Colorado C., G. M. Co. will resume work on their Crown Prince group of three claims in Prospect basin, near Silverton. The Crown Prince adjoins the Henrietta and is opened by a tunnel 280 feet in length. D. S. O'Brien of Beloit, Kan., is president.

SAN MIGUEL COUNTY.

C. Anderson, manager of the Nellie and Ella mines, in Bear creek, owned by the San Miguel Con. G. M. Co., near Telluride, states that the tramway, 1 1/2 miles in length, connecting the mines with the Bear Creek 120-stamp mill of the same company, is in operation and forty stamps are dropping. The Nellie and Ella product is free-milling ore, soft and easily crushed, and nine-tenths of the values are saved by amalgamation.

The tramway and the mill at the Nellie mine, near Telluride, have been repaired and work resumed this week.

SUMMIT COUNTY.

Hoyle & Hoyle, operating the Puzzle and Puzzle Extension mines and the West Side concentrating mill, near Breckenridge, report in driving an upraise from the main tunnel level, 800 feet from the raise to connect with the Puzzle Extension shaft, they have struck a foot of ore, 8 inches of which is heavy silver-lead smelting material.

TELLER COUNTY.

(Special Correspondence)—The Glohe M. & R. Co. are remodeling the Van Fleet sampler at Gold Fields, converting it into a 100 ton mill, designed to crush to 1/2 inch mesh and treat ores direct without roasting. There is considerable ore below \$8 which will not pay to ship out of the district to custom mills, and which is oxidized, requiring no roasting. The ore from the Iron Clad groups is of this nature. This company will treat their own ores from the Iron Clad and custom ores as well. The work of remodeling this mill is under the direction of C. T. Durell, a Montana cyanide man and mine manager. Cripple Creek, April 4.

The August Flower L. Co., operating on the Katinka group of claims on Guyot hill, Cripple Creek, will put in machinery at the three-compartment shaft, including a 7-drill compressor and a direct acting hoist, capacity 1000 feet. On the 600 foot level of the mine, in a south drift from the shaft, a granite dike has been cut and an ore body opened up. The ore is being broken 4 feet in width. The work of extending the 700-foot level to the ore shoot is in progress.

Shipments have begun from the Dead Shot Co. ground on Rosebud hill, Cripple Creek, which is being worked by Satterlee & Co., sub-lessees under Brandt & Estell.

All of the mines at Cripple Creek which had suspended operations due to the strike resumed on the 1st and 2d inst.

There are fifteen sets of lessees operating on the properties of the Gold Dollar Con. Co. on Bull hill, Cripple Creek, including two sets working on the dump, and a total output of 300 tons of ore per month is being shipped. The best showing is in the Griggs lease, who are operating on the fifth level north of the main working shaft, breaking 20 inches of ore which averages \$50 to the ton in gold.

During March the smelters and reduction plants treating Cripple Creek ores crushed and treated 53,860 tons of ore, valued at \$1,849,270, an increase of 2186 tons, valued at \$197,300 over the amount treated in February. This, too, in face of a number of mines closed for the last half of the month. From the regular tonnage there was cut off by the close down of Stratton's Independence mine alone a daily tonnage of 250 tons. Besides that the Isabella, the Elkton, the Ajax, the Strong and the Gold King did not ship for that period. The increase is accounted

for, says the Times, by the reason that when the order went out that no more ore could be shipped to the Standard plant pending the labor situation, every one made an effort to break and ship all the ore possible before the order took effect; also the samplers of the district always carry a large stock of ore on hand and when the trouble was approaching they unloaded the reserve they had in the ore bins.

The Doctor-Jack Pot Co. at Cripple Creek has granted a year's lease to W. S. Ames, in the Davenport shaft.

The Shannon G. M. Co. have leased their ground at Cripple Creek to C. M. Sheffer for two years at 20% royalty. The terms of the lease permit him to prospect for sixty days, from which date his lease is to begin. All working shafts must be vertical, but prospect shafts may follow the vein.

The Granite M. Co., operating on Battle mountain, near Cripple Creek, has opened up the ore shoot in the sixth level, which was last year found in the 1000-foot level. The ore averages \$40 per ton and shipments have begun.

The Globe M. & R. Co., of which W. G. Rice and W. O. Temple of Cripple Creek are principal owners, report the work of remodeling the Van Fleet sampler into a 200-ton cyanide plant progressing and it is expected to be in operation by May 1. This company has a five years' lease on the Ironclad mine on Ironclad hill, near Cripple Creek. A complete plant of machinery is being put up on the Ironclad for mining purposes and a shaft house erected. The main shaft is down 700 feet and considerable lateral work has been done.

Sinking the main shaft on the Ophir claim on Raven hill, Cripple Creek, has been started up again after a cessation of several months. Driving the tunnel has been suspended until the shaft is completed. This tunnel will cut the shaft at a depth of 270 feet. The shaft will go to 300 feet.

The Valley City L. Co., having a bond and lease on the Shurtloff group on Bull hill, Cripple Creek, have deposited \$150,000 to take up the bond on the property as soon as the owners, Becker & Nolan of Colorado Springs, can furnish a clear title, says the Colorado Springs Gazette. The company completed the work of sinking last month as required by the terms of their lease, and the shaft is down 1000 feet, with stations cut at intervals of 100 feet. The ore was first found in the shaft at a depth of 700 feet and is being opened on several levels.

IDAHO.

CUSTER COUNTY.

L. Green, manager of the Clayton M. & S. Co., whose furnaces and mines are at Clayton, says operations will resume next week.

The owners of the Fred Pratt and the Ready Bullion mines, adjoining the Lost Packer, near Mackay, have organized the Idaho Central G. M. & M. Co.

BINOHAM COUNTY.

The White Knob smelter at Blackfoot resumed operations last week and will handle 300 tons of ore per day. The ore runs \$12 a ton. A tunnel 300 feet long has been driven into the group, connecting with the shaft 700 feet in depth. An electric road of 10 miles carries the ore from the mine to the reduction works. There are fifty men at work in the mine. A 4 drill compressor has been set up temporarily, pending the arrival of a 10-drill compressor.

BOISE COUNTY.

A. H. and S. T. Godde of Salt Lake City, Utah, have a bond on the Ella Hill group of five claims at Neal, for one year, for \$60,000, and will begin development next week.

The Robinson & Wood M. Co. have begun operations in Boyle gulch, near Placerville.

IDAHO COUNTY.

The Governor has appointed F. E. Johnnes superintendent of the road to be built to Thunder Mountain from Warren's ranch, for which the State appropriated \$20,000, contingent upon an equal amount being raised by private persons. The sum will be paid by mining companies having interests in the district. The proposed road will be about 70 miles in length.

T. S. Hogan, secretary and treasurer of the Crooked River M. Co. at Oro Grande, in the Buffalo Hump country, near Hump, says a 40-stamp mill will be put in this spring, in addition to the twenty now in operation. The ore is free milling gold and carries sulphides.

SHOSHONE COUNTY.

J. L. Dunn, part owner of the Wild Rose mine at Pierce City, says the mill will be started up next week. During the

winter miners have been doing development work.

The assay office of the Empire State-Idaho M. & D. Co. has been completed at its mill near Kellogg. The building and outfit cost \$2000.

WASHINGTON COUNTY.

E. D. Ford of the Gold Coin M. Co., in Black Lake district, near Council, reports the cyanide plant in operation, and that the capacity of the mill will be increased.

MICHIGAN.

CHIPEWA COUNTY.

Superintendent Ashton of the Copper Queen mine, north of Sault Ste Marie, says a boiler, compressor and hoist are being put in.

HOUGHTON COUNTY.

The March output of the Winona amounted to 71 tons 160 pounds. In addition, the Winona secured 9 tons 1752 pounds of refined copper from mass. The total production since the single head at the Atlantic was secured (Dec. 6) has been 289 tons 1694 pounds.

At No 2 shaft of the Trimountain mine, near Hancock, in eight-hour shifts, 100 skips are hoisted (two tons each).

Houghton advises report the March product of the Mohawk amounted to 397 tons; Quincy, 1056½ tons; Champion, 582 tons; Atlantic, 303 tons; Wolverine, 510 tons.

The Quincy M. Co. at Hancock has contracted with the Houghton County Electric Light Co. for all power to be used by the company in its mine, including motors in the shops and fourteen electric locomotives underground. The Quincy Co. has determined that electricity is more economical than steam and finds it more profitable to contract with the electric light company than to put in an electric plant of its own.

The Mohawk mine, near Houghton, in the annual report for 1902, shows: Received from sales of mohawite, \$77,991; 226,824 pounds copper, at 11 65c, \$26,425; expended at mine, \$446,070; other expenses, \$17,361. The rock stamped in December was 8613 tons, which yielded 226,824 pounds of refined copper—an average of 26 34 pounds per ton. Rock stamped in January and February, 1903, was 40 473 tons, which gave 993,064 pounds of refined copper—an average of 24½ pounds per ton. The rock at the Mohawk mine seems to be harder than at the Wolverine, as the Mohawk mill does not as yet stamp as much rock per head as is stamped at the Wolverine.

MONTANA.

CASCADE COUNTY.

W. G. Conrad, interested in the Queen of the Hills, the Galt and other properties at Nelhart, says arrangements are being made to build a concentrator. The Diamond R. concentrator at Nelhart has been shut down for some time on account of litigation.

The Cottonwood Coal Co., of which J. J. Hill is the principal stockholder, has bought 1000 acres of coal land near Stockett for \$30,000. The Cottonwood Coal Co. has extensive interests in the Stockett fields, and from this source is obtained fuel for the engines on the Montana Central and western divisions of the Great Northern railroad.

FERGUSON COUNTY.

The Big Elk G. M. & M. Co. has incorporated at Lewistown; L. D. Lively, E. E. Briley and W. L. Farnsworth.

E. W. King and W. McClean, operating in the Little Rockies near Lewistown, say a 100-ton mill will be erected on the Putnam & Zortman group. Both cyaniding and shipping ores have been found.

The Mammoth Group G. M. Co. has incorporated at Lewistown, F. M. Baker, F. G. Crowell, and I. M. Gehrum of Atchison, Kan., T. Scott of Cripple Creek, Colo., and D. Scott of Gilt Edge, Mont., to operate the Mammoth group of mines and mill, near Lewistown.

LEWIS AND CLARKE COUNTY.

The Tanner G. & Gem M. Co. has been organized to operate the Pole Creek placer mines at Red Bluff, near Marysville. Spinel and sapphires are found in the gravel, and are recovered from the sluice boxes with the gold and black sand. A. W. Tanner is manager.

T. F. Stephens & Co. are developing the Indian Queen copper mine on Birch creek, near Helena. The vein is showing 20 feet wide with 7% copper and silver values. The Michigan & Montana S. & C. M. Co. has sold to Brown & Platt for \$250,000 its group of eleven quartz and two placer claims, near Alden, on the Blackfoot ceded strip. The chief values are in copper.

L. J. Clergy and D. Spogen have bought for \$2500 the Gardner Bros.' interest in six claims in Silver Camp, 22

miles west of Wolf creek, and have begun development work. The ore has to be freighted from Silver Camp to Wolf Creek, where it is loaded on cars.

Ore shipments are increasing from all districts in the central section of Montana and the East Helena smelter has blown in another furnace, says the Reporter.

The Columbia M. Co., operating the Gold Messenger, near the York, across the river from Helena, are putting in an electric hoist.

J. H. Cowan & Co. will develop and work the placers in the high bed of the Missouri river near Canyon Ferry. This channel lies 185 feet above the present river bed. The mines were worked ten years ago and produced gold and some sapphires. Water was pumped from the river to do the washing.

MADISON COUNTY.

W. W. Wishon, general superintendent of the Speculator M. Co., owning the Fourth of July group near Pony, says they have forty men at work on the Mammoth side of the hill. It is proposed to put up reduction works this spring. It is reported the Garnet M. Co.'s mill will start up by May 1st; also the Strawberry mill. Shipments are being made from the Clipper, three cars being sent out last week.

At Stirling, 3 miles below Pony, the Hennepin Ore Co. are working twenty men on the Galena mine. The new shaft is down 75 feet and a station cut and drifts started, says Superintendent Briggs. A mill is proposed.

MISSOULA COUNTY.

Superintendent Connolly of the Bitter Root Co.'s copper mine at Saltese, says a winze down 30 feet from the 200 foot level shows 10 feet of ore assaying 15% copper and \$8 gold. Forty-seven men are doing development work on the mine. Five shafts have been sunk from 150 to 250 feet, all in ore.

PARK COUNTY.

The Buffalo G. M. Co., J. A. Kennedy of Buffalo, N. Y., president, is planning the development of a number of claims near Cooke.

POWELL COUNTY.

The Eganol Placer M. Co., which owns placer ground in Lincoln gulch, near Elliston, has completed a bedrock drain 2200 feet in length. Fourteen hundred feet of the drain is an open cut and 800 feet is tunneling. The bedrock water proved so strong that pumps were necessary to keep the drifts from being flooded. The channels have proven rich, the gold found being coarse, but the expenses attached to the pumping were such as to make necessary the construction of this drain.

Machinery for the steam hoist for the Sure Thing mine at Elliston, operated by Martin & Canol of Helena, is on the ground. An upraise is being driven from the tunnel.

SILVER BOW COUNTY.

F. W. Bacorn, president of the Cable L. & M. Co., says at the Cable mine, near Butte, he is overhauling the mill for the spring and summer run. Prospecting is now being carried on by a diamond drill.

The Supreme Court has declined to grant a rehearing in the Pennsylvania mine case, but made a redvision of the mine, whereby F. A. Heinze gains 75 feet additional in the vein. This mine was in controversy between Heinze and the Amalgamated C. Co., and the Supreme Court in deciding the title divided the property equally between them. Both sides were dissatisfied with this and petitioned for a rehearing, with the above result.

NEVADA.

Eighteen new companies, with headquarters in Nevada, filed papers of incorporation with the Secretary of State during the last ten days of March.

ESMERALDA COUNTY.

At the Con. Esmeralda M. Co. group, near Hawthorne, operations will be resumed next week. A pipe line will be laid 6 miles for water. The dumps have 70,000 tons of ore extracted, which runs \$10 per ton. A body of \$25 ore has been opened up. A change in the original plans has been made; instead of putting up an engine at the mill and hauling oil for fuel, the engine will be placed at Hawthorne and power transmitted to the mines by electricity, says Superintendent Colcord.

EUREKA COUNTY.

W. C. Owens and W. F. Lineburger of Carlin report finding coal near Palisade, says the Standard.

LYON COUNTY.

The work of developing the Douglas group of copper mines, west of Yerington, is progressing, says the Lyon County Times, with twenty-five miners at work.

The tunnel from the north side has connected with the tunnel on the same level from the south side of the hill. In the upraise ore is opened up. A 2½ H. P. gasoline engine and blower have been put in at the station to furnish air in this upraise. The winze is down below the tunnel level 65 feet. Crosscuts will be run from the winze at every 50-foot level and sinking continued to 200 feet. A gasoline hoist will be placed in the station.

NYE COUNTY.

The Tonopah-Eastern G. M. Co. has incorporated at Salt Lake City, Utah, to operate a group of eight claims south of Butler. W. H. Tibbals, D. A. McDonald, E. J. Waugh and E. W. Wilson are the officers.

A. L. Hudgens has a bond on the Bennett & McCartney holdings in the Bennett group, near Butler, and has started miners at work sinking a shaft on the lead, which is the extension of the Hasbrouck-MoIntyre claims.

J. and H. Workman report a find of gold ore at a point 40 miles north of Butler. Assays of the ore show gold, with bromide, sulphide and chloride of silver.

NEW MEXICO.

GRANT COUNTY.

The Comanche M. & M. Co., composed of Michigan men, have bought the Silver City smelter at Silver City and the first payment made. The plant will be enlarged and improved. It is expected to be in operation by May 1.

OREGON.

BAKER COUNTY.

Wheeler & Co. of New York will operate the Buckhorn group, on Spokane Mt., adjoining the Blue Bird, near Sumpter, says the American. E. J. Thorpe of the Blue Bird is manager.

It is thought by the management of the South Pole Con. G. M. Co., near Sumpter, that a point in the development will be reached this summer which will warrant installing further mining and milling equipment, says Manager S. H. Bell.

Gold-bearing gravel was found last week on the dam site being excavated at the junction of McColloch and Cracker creeks, for a log pond, by the Sumpter Lumber Co., below Sumpter, says the Sumpter Miner.

Superintendent J. K. Romig, of the Sanger mine, near Baker City, says his company will put in an electric plant this season for generating power. The power house will be on Eagle creek. The cross-cut tunnel being driven to open the Fir Gulch vein is within 300 feet of completion.

The Smuggler G. M. Co. have bought the Smuggler, Black Jack, Gaynor, Red Rock and Star quartz claims, in Greenhorn district, near Sumpter.

The Kentucky group is sold to the Pacific G. M. Co. Development work in both these mines will begin this month.

The Greenhorn Mountain G. M. Co. has been incorporated by J. Fawcett, I. H. Hatfield, W. P. Killen, J. H. Humpes of Omaha, Neb., to operate in Greenhorn district, near Sumpter, says the American.

Manager A. Mohr of the St. Louis mine, near Sumpter, says work will resume this month and a 300-foot tunnel will be driven on the west side of the gulch to the west of the present workings. If this shows satisfactorily, a sinking plant will be put up. Mohr is also manager of the Wisconsin, which will resume, and a heavier pump will be put in. Sinking will follow.

T. K. Clarke of Indiana has bought the Orphan Boy group of prospects in Mormon basin, near Sumpter, for \$6500. Development will begin next week.

Bamberger & Keith of Salt Lake City, Utah, owning La Bellevue mine near Sumpter, say it will be reopened this spring. There are 7000 feet of development work done, with one tunnel in 1500 feet, and there is a Huntington mill of thirty-five tons daily capacity.

Manager R. N. Jones of the Cornucopia Mines of Oregon Co. has temporarily suspended work at the Last Chance mine in Cornucopia district, near Sumpter, it being considered too hazardous for men to pass between the Union-Companion and the Last Chance in the present state of weather, as spring thaws cause frequent and heavy slides. A change in the method of operating will be made this summer.

Manager J. N. Esselstyn of the Mountain View mine, near Baker City, says he expects to have his gasoline hoist operating by May 1st, which will be placed underground 800 feet and used for raising to the tunnel level only.

F. P. Schultz of Milwaukee, Wis., president of the Old Ahe G. M. Co., near Sumpter, says that two 80 H. P. boilers, a six-drill compressor, a hoist with 700 feet depth capacity and pumps are to be put in this month and further development work done. A mill is proposed.

The Cracker-Highland G. M. Co. has

incorporated, J. C. Davies, D. Cahill and C. L. Stickney, to develop a group east of Bourne, and near the Minneapolis group.

President Patton of the Stockton Co., near Sumpter, says they will sink to a depth of 700 feet, being down 220 feet. A hoist is already up, but they intend to put in a compressor plant and heavier pumps.

The Bonanza main compartment shaft, near Sumpter, is down 1000 feet, being the lowest depth reached in the camp. A station has been cut for a pump. Ore is being stoped on the 800-foot level for milling. Thirty of the forty stamps are dropping.

DOUGLAS COUNTY.

After a suspension of several months, operations at the Myrtle Creek oil well, near Myrtle creek, are to be resumed by the Umpqua Valley Oil Co. of Roseburg, says the Roseburg Review.

GRANT COUNTY.

Manager Hughes of the Equity Co. says he is putting in a concentrator for their 5-stamp mill near Quartzburg.

The New Year's Gift mine, near Quartzburg, has been sold to J. Reese.

Work will be resumed this spring on the Gladstone group, near Alamo, owned by the Interstate G. M. Co., W. H. Meade of Spokane, Wash., manager. There are five claims, and a tunnel is driven on the ledge.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Manager W. L. McLaughlin of the Horseshoe M. Co., near Deadwood, says operations have resumed in the mine and that the mill will be completed.

There are 20 feet of ore exposed on the Card & Rosenkranz ground at the head of Falsebottom creek, near Deadwood, in a drift from the bottom of a shaft 100 feet deep, and assays show an average of \$4.21. Six feet of the ore is said to be phonolitic. The slates next to the ore are also mineralized, and give assays of \$4. This ground is being worked under bond and lease by E. P. Farnham of Central City, representing Chicago men.

The monthly report of the Spearfish M. & R. Co., near Deadwood, shows for March 6100 tons of ore mined and treated at the mill, the capacity being 200 tons per day. The value of the ore averaged \$5 per ton and a net profit of \$2.50 per ton is made above the expenses of mining and milling.

PENNINGTON COUNTY.

(Special Correspondence)—The Bullion gold mine at Keystone is sold to F. H. Long, a mining engineer of Chicago, who, with his associates, will place the property upon a working basis. Ore has been blocked out to furnish a mill of 300 tons daily capacity. It is contemplated to erect a 300-ton plant. The ore averages nearly \$7 per ton. About 50% is free milling. Stamps and plates will be used, together with a concentrating plant and cyanide annex. The main vein is 40 feet wide.

Keystone, April 4.

The Lakotah M. Co. of Peoria, Ill., men, owning the Grizzly Bear mine, near Keystone, will increase development work this summer. The mill will be replaced by a more modern plant on the same site and an aerial tramway put up. Development work has been under way in the mine during the past winter.

TEXAS.

EL PASO COUNTY.

The Federal smelter at El Paso is reported to have resumed. The company owns a group of mines at Terrazas, in Chihuahua, Mexico.

Reports from El Paso smelter, at El Paso, say that due to the increased tonnage of Mexican ores coming in, another copper furnace has been blown in. Five furnaces are running, but coke is scarce.

MENARD COUNTY.

J. R. Stone reports uncovering gold ore a few miles from Menardville.

UTAH.

BEAVER COUNTY.

Manager F. Morehouse of the Erle C. M. Co., near Milford, says a 22 H. P. gasoline hoist will be put up. The main working shaft is down 200 feet.

Manager Crowther of the Blue Acre mine, at Blue Acre, says last week a 3-foot excavation for a cellar exposed a vein of copper ore. Sinking was continued, and at 12 feet the bottom is all in ore, associated with iron and quartz. No. 1 shaft is down 185 feet and going down at the rate of 2 feet per day. It is in ore with several inches of sulphide that carry 20% copper. The vein will be crosscut on the 200.

S. Osborne, superintendent of the O. K. mine of the Majestic M. Co., near Milford, last week put in a 34 H. P. gasoline hoist

at the Old Hickory and one at the O. K., making a total of five gasoline hoists on the Majestic group. The 12 H. P. hoist formerly on the Old Hickory will be removed to the Gomer shaft of the Harrington-Hickory.

J. W. Taylor of the Hub M. Co. says development work will be begun next week on the group of nine claims in South Star district, near Milford. It is the intention to send the 60-foot shaft down to 600 feet. The Hub adjoins the Burning Moscow and Big Gentile.

CARBON COUNTY.

Small oil flows are reported struck in the wax claim shafts near Colton.—Cafey, Ranschoff, Moritz et al. propose putting in an oil rig in Argyle canyon this summer.—Manager Ketchum of the Grand View Co. says he will resume work near Sunnyside next week.—McWhorter & Hastings are waiting for the snow to melt, to resume above Sunnyside.

—The Price Oil Co. will put up a drilling rig on their ground near Sunnyside, says Manager M. Sommers.

Manager Ketchum of the Grand View Oil Co., whose well is near Sunnyside, states he will open operations this month.

IRON COUNTY.

At the Johnny mill at Stateline the cyanide plant was put in operation last week, treating the tailings.

B. F. Thornburg of Salt Lake City has a lease and bond on a group of claims at Kanarraville for \$5000.

JUAB COUNTY.

A total of 452 cars of ore were shipped from the mines of Tintic district, around Eureka, during March, the principal shippers being: Centennial-Eureka 106 cars, Dragon iron mine 73, Grand Central 81, Gemini 50, Mammoth 47, Yankee Con. 28.

Manager C. E. Allen of the Centennial-Eureka mine, at Eureka, says sinking of the main shaft has been temporarily suspended, due to the drainage of an excess of surface waters down onto the men at work.

PIUTE COUNTY.

(Special Correspondence).—The Overlooked property is reported improving. The quartz is different from any other in the district and is yellow, with dark purple streaks and spots, with iron oxide that is rich. Five inches of the vein shows gold. R. DeWitt has opened an extension of this property, which shows well.

M. Hennessy of Horse Heaven reports a fine showing of ore in the Bodle.

Packard Bros. are at work on their property in Bullion canyon.

W. Hehl, owner of the Midnight Sun, is developing a body of gold ore.

The Gold Queen, on Deer creek, gave returns of \$10 in gold across an 8-foot ledge.

The extension of the Denver & Rio Grande Railway from Marysvale to a point 90 miles south is expected, as contracts have been let for the work. It is expected to tap the Santa Fe and a branch of the Clark road at Cedar City.

Marysvale, April 5.

SALT LAKE COUNTY.

The Salt Lake Tribune says the bullion output of the valley furnaces during the month of March amounted to \$2,784,479, inclusive of that produced at the independent smelters. This is a slight shrinkage, attributable entirely to the breaking up of the roads between the diggings and the loading stations along the lines of railway. The output of copper bullion during the same period shows the independent smelters forwarding to Eastern refineries 2,849,797 pounds, valued at \$750,000, while the two copper furnaces operated by the American S. & R. Co. produced 1,329,000 pounds, which, in addition to copper, gold and silver, contained a few units of lead. The March record was as follows:

	Pounds.
American.....	1,329,000
Bingham Con.....	727,190
Highland Boy.....	1,268,400
United States.....	854,207

Total.....4,178,797

In the open market the ore and bullion settlements for the month reached a total of \$2,029,540, as compared with \$1,410,190 for the corresponding period of 1902, and with \$2,039,500 for February.

The Gold Flusure M. Co. of Salt Lake City has incorporated; A. J. Weber, J. F. Gihhs, M. P. Baffet. The company owns eight claims in the Henry district, Sevier county, and three claims in Gold Mountain district, Piute county.

Work has been partly resumed in the Dalton & Lark tunnel, near Bingham, which recently struck a 2000-gallons-a-minute flow of water that drove the men out.

SUMMIT COUNTY.

H. C. Brownlee, superintendent of the

St. Louis-Ontario M. Co. at Park City, says machinery will be installed.

Manager S. Levy of the California mine at Park City says a steam plant is being put in to hasten sinking the shaft to the tunnel level.

For March, at the properties of the Daly-West M. Co., at Park City, the output was 7000 tons of ore and concentrates, for which it received approximately \$200,000. E. Bamberger, assistant manager, says the forwarding of ore from the Quincy shaft has resumed.

A two-third interest in the St. Lawrence group in the Utah mining district, near Park City, has been sold to the Nail-driver M. E. & M. Co.

Manager R. G. Wilson of the New York mine, Park City, says the hoisting plant is in operation and sinking will resume.

WASHINGTON.

FERRY COUNTY.

Manager C. O. Barnes says he has contracted with the smelter to ship ore from the Trade Dollar mine, near Republic—freight and smelter charges \$5.70 per ton. The entire ore dump will be shipped and stoping will be started.

OKANOGAN COUNTY.

J. P. Blaine, resident manager of the Opal M. Co., at Chesusaw, says more men will be put on at the Opal, and work will be started on the Ben Harrison, adjoining, owned by the same company. A reduction plant will be put up.

SNOHOMISH COUNTY.

The Bell & Crown mine resumed operations last week, says Manager Johnson. The mine is 3 miles from Silverton, on the south side of Marble mountain.

STEVENS COUNTY.

The Northport News says the Northport smelter of Le Roi Co. has four furnaces in operation and the fifth will be blown in next week. Every train arriving from the south is bringing in ten to fifteen cars of coke, and a supply has been arranged for with Eastern companies.

The McIntyre mine, in Black canyon, on Deep creek, near Northport, has resumed. There is a 260 foot tunnel on the claim, and this will be driven ahead, expecting to cut the vein with 40 feet more. There are two ledges of 14 and 30 feet in width on the surface, showing values from \$7 to \$28 in silver and lead.

WHATCOM COUNTY.

The Mount Baker-Yale M. Co. will put up an 80-stamp mill on their group, near Whatcom, instead of forty stamps, as at first proposed.

WYOMING.

ALBANY COUNTY.

The derricks for the Laramie Oil & Gas Co. are being placed at a point 12 miles up the Big Laramie from Laramie, and drilling will begin next week. The company expects to strike oil or gas at a depth of 1500 feet.

CONVERSE COUNTY.

Superintendent Phillips is erecting additional buildings at the oil wells, near Douglas.

Manager E. J. Wells will put in additional machinery at the Orville mine in the War Bonnett copper district, near Douglas.

UINTA COUNTY.

Oil is reported struck at the Craig well, near Spring valley, owned by the Carter estate.

FOREIGN.

BRITISH COLUMBIA.

At the Le Roi mine, Rossland, the ore shoot has been opened up on the 1050-foot level. The smelter has blown in three furnaces.

At Le Roi No. 2, in the Josie and No. 1 mines, undercutting the ore bodies in the lower levels is being carried ahead. The surveys of the millsite are finished.

The Marble Bay mine at Texada has begun ore shipments. The total output of the mine—100 tons daily—will be sent out.

H. M. Stevenson, manager of the Highlander mine at Ainsworth, says that, owing to the rise in price of lead, his company will start operations this month.

Last week the branch pole line from Cascade sub-station in Phoenix to the Snowshoe mine was completed and an electric hoist and transformers are being put in place. Ore bins of 150 tons capacity are being built at the hoist.

The coal miners' troubles on Vancouver island are extending to Cumberland. When the 1000 or more miners employed at the Extension mines voted to join the Western Federation, J. Dunsmuir, the owner, closed the mines. A branch has been organized at the Union mines at

Cumberland. There are 500 men employed there. If these men join the federation the mines will be closed down, as have those at Ladysmith, says Dunsmuir.

R. Fraser, as agent for G. T. Henderson of Canton, S. D., has posted notice for 7000 inches of water at Bull river falls; also eighty acres of placer ground, near Fort Steele, says the Prospector. The water will be used for motive power to generate electricity to be supplied to the towns and mines of the district.

KLONDIKE.

Dawson reports say rich pay has been struck on Bear creek. On 14 below \$6 to the pan at 6 feet in bedrock was found. The richest pay on Gold Bottom creek was found on 11 below, where \$14 to the pan was taken out. The railroad between the Yukon river and the coal mines, on Coal creek, will be completed and in operation by August 1. The Chute and Willis group on Gold Run has been transferred to the Gold Run syndicate of Paris for \$1,500,000. A. McDonald has sold ten claims on Chebacco hill to the Chebacco Hill M. Co. of New York for \$30,000, says Manager Holland.

MEXICO.

CHIHUAHUA.

The Chihuahua Enterprise says a 100-ton concentrating plant will be built 5 miles from Minaca, also a narrow-gauge railroad from that place to the plants and mines, by the Calera M. Co. Development work has opened up holes of ore carrying values in zinc, lead and silver.

The Chihuahua M. Co. at Santa Eulalia are putting in another engine and expect to increase shipments to 700 tons of ore daily.

The Candelaria M. Co., D. B. Smith superintendent, is doing considerable development work at its mines at San Pedro. A double-compartment shaft is down 330 feet and will be sunk 1000 feet.

The water has been brought under control in the Prieto mine, near Parral, and operations will resume next week.

GUERRERO.

The Mitchell M. & S. Co., G. Mitchell of Los Angeles, Cal., president, has made a survey from the company's mines for a railroad to Acapulco. Additional machinery will be put in at the mine.

SONORA.

Boyce & Conkling have started work on the La Cahriza mine, near Sahuaripa. J. Burke is superintendent. The mine is 100 miles from Minaca, and shows values in gold, copper and silver. There is a shaft down 60 feet, and if the ore body continues it is planned to build a smelter. Tinber is abundant.

M. Mendenhall, metallurgist of the Nogales C. Co., says a 300-ton cyanide plant will be erected at the Cerro Prieto gold mines at Cerro Prieto, owned by the company. F. N. Cox is superintendent of the mines.

J. C. Underwood, manager of the Yerkes M. Co., at Yerkes Camp in Altar district, says the 20-stamp mill and the cyanide plant are in operation.

J. W. Gates & Co. are reported to have bought the Creston and Colorado mines, 15 miles east of Torres, on the Sonora Railway, for \$10,000,000.

Books Received.

The Statistician and Economist for March, 1903, is fully up to the valuable compilation of statistics published for so many years by the veteran statistician, L. P. McCarty, 929 O'Farrell street, San Francisco, Cal.; price 25 cents.

"Notes on Metallurgical Analysis," by N. W. Lord, professor of metallurgy and mineralogy at the Ohio State University, is a book intended as a text book for students in metallurgical chemistry. It gives in a condensed form a series of selected methods and descriptions of metallurgical processes. Sixteen illustrations, 228 pages. Price, \$2.50, postage prepaid. Ohio State University, Columbus, Ohio.

"Railroad Construction, Its Theory and Practice," is the title of a newly revised edition on this subject, by Walter Loring Webb, C. E. It deals with every phase of railroad construction, including excavation, rock blasting, tunneling, etc., as well as trestles, bridges, etc.; and also has an interesting chapter on the block system. The work contains 672 + XVII pages, and 232 figures, including halftones. The principal feature of the new edition of this well-known book is in its volume which has been reduced to pocket size, 4 1/2 x 7 inches. Bound in flexible morocco. Price, \$3. John Wiley & Sons, New York and London.

PERSONAL.

J. A. FLINT, of Butler, Nev., is in Montana on mining business.

S. LEVY is manager of the California mine at Park City, Utah.

P. FLYNN of Denver, Colo., is in Idaho, examining mining property.

A. SUTHERLAND is assayer at the Victor mine at Robinson, Utah.

HENRY BUTTERS has returned to San Francisco, Cal., from Europe.

J. F. SHELTON of Sumpter, Or., has gone East on mining business.

J. B. WORD, M. E., of San Francisco, Cal., has gone to Denver, Colo.

P. WOODS of Folsom, Cal., is in San Francisco, Cal., on mining business.

W. OCHS, of Salt Lake City, Utah, is in Eureka, Nev., on mining business.

W. L. McLAUGHLIN is manager of the Horseshoe M. Co., near Deadwood, S. D.

F. BETTLES of Salt Lake City, Utah, is at the Revenue mines and mill at Norris, Mont.

J. F. BECK, who is interested in mining properties at Butte, Mont., is in San Francisco, Cal.

MANAGER W. J. DOOLY of the Johnny mine at Stateline, Utah, is in Salt Lake City, Utah.

R. L. HAMMOND of Iron Mountain, Mich., is in Salt Lake City, Utah, on mining business.

F. MOREHOUSE of Salt Lake City, Utah, is examining mining property near Mendota, Idaho.

MANAGER ATWATER of the Ymir mine at Ymir, B. C., returned from Spokane, Wash., last week.

J. P. BLAINE, resident manager of the Opal M. Co., has returned to Chesaw, Wash., from Ohio.

FORMER SUPERINTENDENT BROUGHAL of the Daly-Judge mill at Park City, Utah, has resigned.

MANAGER C. E. KNOX of the Montana-Tonopah M. Co., is at Butte, Nev., from Salt Lake City, Utah.

GEO. L. WALKER is general sales agent Pacific Steel & Wire Co., 100 Front street, San Francisco, Cal.

MANAGER C. N. THOMAS of the Nogales Copper Co. at Cerro Prieto, Sonora, Mexico, is in Chicago, Ill.

S. F. HUNT returned last week to Salt Lake City, Utah, from an examination of mining property in Idaho.

C. MITCHELL is in charge of the laboratory at the Black Diamond mine and smelter, near Bisbee, Ariz.

J. DERN, of Salt Lake City, Utah, president of the Con. Mercur M. Co., is in Fremont, Neb., for a brief visit.

P. J. DONOHUE of the Western Exploration Co. returned to Salt Lake City, Utah, last week from Canada.

B. CRILLY has resigned as superintendent of the Nettie L. mine at Loomis, Wash., and is in San Francisco, Cal.

E. S. GILES is manager of the Centurion M. Co., operating on Donaldson mountain, near Idaho Springs, Colo.

E. W. BADGER of Amboy, Ill., returned last week from an examination of mining property in Yavapai county, Arizona.

PRESIDENT D. H. PEERY of the Salt Lake City, Utah, Mining Exchange, has returned from a trip to Honolulu, H. I.

W. F. SNYDER of Salt Lake City, Utah, manager of the Western Exploration Co., has gone to California on mining business.

C. D. LANE, owning mining interests in Alaska, has returned to San Francisco, Cal., from Nome and Ketchikan, Alaska.

O. W. KESTER of Park City, Utah, is superintendent of the Latham mine at Spruce, in Spruce Mountain district, Nev.

D. McVICHIE, manager of the Bingham Con. M. Co., returned last week to Salt Lake City, Utah, from Boston, Mass.

W. McCORNICKE of the Siberian Exploration Co. left Salt Lake City, Utah, last week for the company's mines in Siberia.

H. C. BROWNLEE, superintendent of the St. Louis-Ontario M. Co., returned to Park City, Utah, from St. Louis, Mo.

G. W. SCOTT, superintendent of the Black Oak mine, near Soulsburyville, Tuolumne county, Cal., is in San Francisco, Cal.

M. MENDENHALL is superintendent of

the cyanide plant to be erected by the Nogales C. Co. at Cerro Prieto, Sonora, Mexico.

J. ROSS JR., superintendent of the Wildman-Mahoney mine, at Sutter Creek, Amador county, Cal., is in San Francisco, Cal.

W. GRAVES of Salt Lake City, Utah, has gone to Nicaragua, C. A., as superintendent of a gold reduction mill near Bluefields.

FRANK GRIFFIN, general manager Western Engineering & Construction Co., has returned to San Francisco from Santa Barbara, Cal.

A. G. DE CHAMPS, former manager of the Portland G. M. & M. Co. at Cripple Creek, Colo., is examining mines in Sonora, Mexico.

SYDNEY REEVES, who has had charge of the Echo Co.'s 10-stamp mill, 5 miles west of Mojave, Kern county, Cal., is in San Francisco, Cal.

O. STALMANN, manager of the Glasgow & Western Exploration Co., has returned to Salt Lake City, Utah, from their Nevada camps.

M. SOMMER, vice-president of the St. Louis-Ontario M. Co. at Park City, Utah, returned last week from a directors' meeting at St. Louis, Mo.

H. M. STEVENSON, manager of the Highlander mine at Ainsworth, B. C., returned last week from an extended visit to New York and Philadelphia.

C. E. PALMER of Colorado Springs, Colo., is superintending engineer of operations for the Guggenheim Exploration Co., with offices in Denver, Colo.

H. A. COHEN of Salt Lake City, Utah, manager of the Bully Hill group of mines and smelter at Winthrop (De Lamar), Shasta county, Cal., is at the mine.

E. E. NOON, superintendent of the Santa Rosalia mine and mill, near Arizpe, Sonora, Mexico, is examining mining property near Acapulco, Guerrero, Mexico.

M. E. HILON of Deadwood, S. D., former manager of the Columbus plant, is instructor in chemistry and assaying, Nebraska State University, at Lincoln, Neb.

W. LARSON, vice-president, and W. M. Thomas, secretary, of the Nogales Copper Co., returned last week to Chicago, from their mines at Cerro Prieto, Sonora, Mexico.

G. F. HOFFMAN, E. M., of San Francisco, Cal., has gone to Siberia, via Nome, in the interest of the Guggenheim Exploration Co. He is accompanied by his son, J. D. Hoffman.

O. C. ZINNS, who for several months past has been chemist at the reduction works of the Penn Chemical Co. at Campo Seco, Cal., has resigned, and is in San Francisco, Cal.

J. M. COX, for seven years foreman of the Mokelumne and Campo Seco Canal & M. Co., near Mokelumne Hill, Cal., has resigned and gone to San Francisco, Cal. M. B. Lillie succeeds him.

PERCY S. DAVIS, one of the directors of the Davis Calyx Drill Co., has returned from a prolonged business trip in Australia. On the way back Mr. Davis stopped at Sonora, Mexico; Virginia City, Nevada, and a number of other localities where the Davis drills are in operation.

H. NOYES and H. R. SKINNER, commissioners appointed by the British Government from Johannesburg, S. A., to investigate labor in China with a view to obtaining laborers to supply the demand in the mines of the Rand, are in San Francisco, Cal. While in California they will inquire into Chinese labor on the Pacific coast.

FRANK H. PROBERT of the firm of McLean & Probert, consulting mining engineers of Los Angeles, Cal., has been appointed consulting engineer to the W. B. Thompson Co. of 10 Postoffice Square, Boston, Mass., who are operating the Shannon Copper Co. and the Coronado Mining Co. at (ifton, Ariz. Mr. Probert will devote the greater part of his time to the company's interests in Arizona.

JOHN RYAN, superintendent of the works of the Pacific Coast Borax Co., in Death Valley, Cal., is reported to have been assassinated by Indians 9 miles from the company's camp at Borate, in Inyo county, Cal. The only reason assumed for the murder is the fact that the Indians of that vicinity guard the limited

water supply of the region jealously, and as Mr. Ryan was in search of water with the company's tank wagon, accompanied by a teamster, who was also killed, the Indians probably shot them.

J. C. RUSSELL, a retired pioneer miner and business man of California and Colorado, died on the 2nd inst at his home in White Plains, N. Y. Deceased was born May 16, 1829, in New Hampshire, and leaves a daughter and three sons, one of whom—F. M. Russell—is a mine owner of Wallace, Idaho.

R. BANE, a pioneer miner of Shasta county, Cal., died at Newtown, El Dorado county, Cal., April 1st at the age of 74 years.

Commercial Paragraphs.

THE Western Engineering & Construction Co. has moved its offices from the Safe Deposit Bldg. to 408-414 Rialto Bldg., San Francisco, Cal.

THE Pacific Steel & Wire Co., Frank L. Brown general manager, have opened offices and salesrooms at 100 Front street, San Francisco, Cal.

F. W. BRAUN & Co. of San Francisco and Los Angeles, Cal., report arrangements made by which they become the sole selling agents in Australia and New Zealand for Wm. Ainsworth & Sons' balances.

HENSHAW, BULKLEY & Co., of San Francisco, Cal., report shipping this week a Kinkadee mill to the Keystone mine, at Amador City, Amador Co., Cal. Competitive tests are to be made between this mill and a 5-stamp battery.

STRATTON'S INDEPENDENCE, LTD., MINE, Victor, Colo., has put in a Jeanesville Iron Works' compound condensing pump, capacity 1000 gallons per minute, on their 1400 foot level—the deepest pumping plant in the State.

H. A. LEE, Colorado's Commissioner of Mines, and J. W. Finch, the Colorado State Geologist, have formed the partnership of Lee & Finch, Equitable Bldg., Denver, Colo., for practice in mining engineering and economic geology.

HENRY ENGELS has been appointed Pacific coast agent of the Chicago Pneumatic Tool Co. Mr. Engels will have his headquarters with Eccles & Smith, 91 Fremont street, San Francisco, Cal., the latter gentlemen continuing as general agents of the company.

THE American Steam Gauge & Valve Mfg. Co., Boston, Mass., the well-known manufacturers of gauges, valves, indicators, etc., has recently been incorporated under the laws of New Jersey with a capital of \$250,000. The company will have completed, for occupancy in the early fall, a new factory building, where their present output can be doubled.

THE Risdon Iron Works of San Francisco, Cal., report having a contract for the construction of 4,000,000 pounds of steel pipe for the water-power plant being built on the Puyallup river, near Tacoma, Wash., by the Pierce County Improvement Co. At its head the pipe line will be 48 inches in diameter, being gradually reduced to 36 inches at the bottom. The first section will be 1700 feet long and have a drop of 877 feet. An order has also been received this week by the Risdon Iron Works for a 10-stamp mill from the North American M. & M. Co. at Barron, Wash.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMPENSATING HEELS FOR BOOTS OR SHOES.—No. 724,150. March 31, 1903. Robert Wynell, San Francisco, Cal. This invention relates to an attachment for boot and shoe heels which is designed to compensate for the wear which ordinarily takes place upon these parts and to keep them constantly in proper shape for walking. It consists of a flanged cup fitting a hole made in the heel of the shoe and preferably nearer to the side upon which the wear takes place. Within this cup is fitted the wear-piece, which projects slightly so as to receive the impact of walking, and this wear-piece may be extended as fast as it is worn away by the use of interior filling pieces or washers, which rest upon the interior bottom of the cup.

MACHINE FOR MAKING TUBULAR SHELLS.—No. 724,104. March 31, 1903. C. E. Ingals and A. V. Jackson, West Berkeley, Cal. This invention relates to improvements in paper shell making machines, and its object is to provide an automatic machine for making tubular shells designed particularly for use with dynamite cartridges. It consists in a machine, the combination of a containing receptacle for blanks; a vertically movable follower thereon; means including a lever whereby the follower is given an intermittent movement; a horizontally reciprocating foot-piece, and link connections between said foot-piece and lever whereby the follower and foot-

piece are operated in unison: feed rollers by which the sheet is advanced; and stop means whereby the feed rollers and foot-piece are adapted to project into the path of said sheet to check its movement thereon during the forward movement of the foot-piece. There are also means of construction by which holes of any desired size may be made; and so the manufacturer's name may be imprinted upon the shell as the form-roller is advanced, and in operation on the timing of the various movable parts is so regulated that the several movements are co-ordinated to achieve the results contemplated.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING MARCH 31, 1903

724,237.—PAPER FILE.—L. W. Armstrong, Walla Walla, Wash.

724,846.—FALL ROPE CARRIER.—M. Bradford, Los Angeles, Cal.

724,325.—JAW CLOSURE.—W. E. Brown, Los Angeles, Cal.

73,084.—STOVEPIPE FASTENER.—F. H. Busby, S. F.

718,838.—LOCK AND ESCUTCHEON.—W. Chalmers, S. F.

723,958.—WINDMILL.—O. Church, S. F.

724,161.—DRILL.—Clark & Currie, S. F.

724,405.—WINDOW WASHING SCAFFOLD.—J. C. Brown, Los Angeles, Cal.

714,266.—FRUIT WRAPPER.—E. Duvanes, Sierra Madre, Cal.

721,384.—ANCHOR.—C. E. Fowler, Seattle, Wash.

724,408.—PORTABLE HOUSE.—J. D. Horton, Seattle, Wash.

721,101.—TENTRAL SHELL MACHINE.—Ingals & Jackson, Berkeley, Cal.

724,409.—CASH REGISTER.—P. Lalo, S. F.

724,024.—HOLDER FOR TRAIN ORDERS.—C. A. Luck, Berkeley, Cal.

724,191.—TRIAL FRAME.—S. G. Marshutz, Los Angeles, Cal.

724,327.—GUN ATTACHMENT.—R. M. G. Phillips, Los Angeles, Cal.

724,309.—JAW CAP TOOL.—J. G. Rosenberg, Seattle, Wash.

724,053.—OIL BURNER.—R. F. Schroeder, Sacramento, Cal.

724,341.—POWER TRANSMITTER.—F. Sedivy, Globe, Ariz.

724,316.—JOINT SUPPORT.—R. Staeton, Portland, Or.

724,362.—TWIN HOLDER.—J. A. Thompson, Seattle, Wash.

724,362.—FISH NO. GEAR.—A. W. Wilson, S. F.

724,150.—HEEL FOR BOOTS AND SHOES.—R. Wynell, S. F.

Latest Market Reports.

SAN FRANCISCO, April 10, 1903.

METALS.

SILVER.—Per oz., Troy: London, 22½d (standard ounce, 925 fine); New York, bar silver 49½; refined (1000 fine); San Francisco, 49½; Mexican dollars, 38 @ 39c San Francisco, 38½c New York.

COPPER.—New York: Standard, \$13.75; Lake, 1 to 3 casks, \$14.50; Electrolytic, 1 to 3 casks, \$14.50; Casting, 1 to 3 casks, \$14.25; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £60 10s spot per ton.

Copper the past week has shown a slightly lower tendency, though the demand seems to have been little decreased. The best grades of Lake copper are in large demand for electrical purposes. Fluctuations of copper stocks in the stock markets do not affect the trading in the metal apparently. The statement is made in Boston that Lake mines operated by the Amalgamated Association have worked at a loss, while independent mines in the same district have made money for their owners the past year, as determined by the reports of the several companies.

LEAD.—New York, \$4.67½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$1.75. London: £13 13s 9d per long ton = 2.75c per lb.

SPELTER.—New York, \$5.65; St. Louis, \$4.60; London, £23 5s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 100-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$30.00@30.05; San Francisco, ton lots, 31½c; 500 lbs., 32c; 200 lbs., 32½c; less, 33c; bar tin, \$35 @37½c. London, £138 15s spot.

PLATINUM.—San Francisco, crude, \$18.00 @ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$45.50@46.00; large lots: London, £8 15s; San Francisco, local, \$45.00 @ flask of 7½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17 15c.

NICKEL.—New York, 50@60c @ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.35; gray forge, \$20.50; San Francisco, bar, 3c @ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg,

Obituary.

JOHN RYAN, superintendent of the works of the Pacific Coast Borax Co., in Death Valley, Cal., is reported to have been assassinated by Indians 9 miles from the company's camp at Borate, in Inyo county, Cal. The only reason assumed for the murder is the fact that the Indians of that vicinity guard the limited

\$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; 1x4, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.35; Cut, \$3.35; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15¢; less than one ton, 17¢. No. 1*, 60%, carload lots, 13¢; less than one ton, 15¢. No. 1** 50%, carload lots, 11¢; less than one ton, 13¢. No. 2, 40%, carload lots, 10¢; less than one ton, 12¢. No. 2*, 35%, carload lots, 9¢; less than one ton, 11¢. No. 2** 30% carload lots, 9¢; less than one ton, 11¢. Black blasting powder in carload lots, minimum car 725 kgs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s. 10½¢ per set; 14 oz., 40s., 9½¢.

CEMENT.—Germania, \$2.50 @ 2 75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50 @ 2 75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

COAL.—San Francisco, coast, yard prices: Wellington, \$3.00; Seattle, \$6.50. Coos Bay, \$5.50; Southfield, \$3.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$3; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 56¢; cs., 61¢; raw, bbl., 54¢; cs., 59¢; Lucol oil, boiled, bbl., 50¢; cs., 55¢; raw, bbl., 48¢; cs., 53¢. Kerosene—Pearl, per gal., 22½¢; Astral, 22½¢; Star, 22½¢; Extra Star, 25½¢; Eocene, 24¢; Elaine, 27½¢; Water White, in bulk, 16¢; Mineral Seal, iron bbls, 18½¢; wooden bbls., 21¢; cs., 24¢; Mineral Spermin, cs., 26½¢; Deodorized Stove Gasoline, bulk, 17¢; do., cs., 23½¢; 86° Gasoline, bulk, 21¢; do., cs., 27½¢; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16¢; do., in cs., 22½¢; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75¢; cs., 80¢; Spermin, crude, 50¢@60¢; Natural White, 65¢; Bleached do, 70¢; Whale Oil, cs, 50¢@55¢.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 25¢@26¢ per lb.; carloads, 24¢@24½¢; in tins, 35¢; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 28¢@30¢ per lb.; caustic soda, in drums, 3¢@4¢ per lb.; Cal. s. soda, bbls., \$1.25@1.50 per 100 lbs.; sks., \$1.05; chlorate of potash, 12¢@13¢; nitrate of potash, bbls., 8¢; caustic potash 10¢ in 40-lb tins; borax concentrated, 7¢@8¢ per lb.; roll sulphur, 4¢@6¢; powdered sulphur, 2¢@3¢; flour sulphur, French, 2¢@3¢; alum, \$2.00@2.25; California refined, 2¢@2½¢ sulphide of iron, 9¢ per lb.; copper sulphate, 5¢@7¢; chloride of lime, spot, \$3.00@4.00 sulphuric acid, in carboys, 66¢ B, 2½¢ per lb.; nitric acid, in carboys, 8¢ per lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6¢; less than 500 lbs., per lb., 6½¢; in 25-lb. tin pails, ½¢ per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, ½¢ per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¢; do. in kegs, 6½¢.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6¢; less than 500 lbs., 6½¢.

LITHARGE.—Pure, in 25-lb. bags, 8¢@9¢ per lb.

BONE ASH.—Extra No. 1, 5¢@6¢ per lb. No. 1, 4¢@5¢.

BORAX.—Concentrated, 7¢@9¢ per lb. powdered, 9¢@12¢; fused, 25¢@30¢.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4¢ per lb.

BORAX.—Crystal, 7¢; calcined, 25¢.

COPPER.—Sulphate, 5¢@7¢.

MANGANESE.—Pure, ½ lb., 60¢.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

SODIUM.—Metal, ½ lb., \$1.00.

MERCURY.—Bichloride, ½ lb., 90¢.

PHOSPHORUS.—(American) ½ lb., 75¢.

SILVER.—Chloride, ½ oz., 90¢@1.00; nitrate, 55¢.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50¢; dust, ½ lb., 10¢; sulphate, ½ lb., .04¢.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

HENRY OAREY BAIRD & CO.,
INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS.
310 Walnut St., Philadelphia, Pa., U. S. A.
Our New and Revised Catalogue of Practical and Scientific Books, 32 pages, 8vo., a Catalogue of Books on Metallurgy, Mining, Prospecting, Mineralogy, Geology, Assaying, Analysis, etc.; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

Three New and Splendid Industrial Books.

JUST READY.

Flemming—Practical Tanning: A Handbook of Modern Processes, Receipts and Suggestions for the Treatment of Hides, Skins, and Pelts of Every Description. By Louis A. Flemming, American Tanner. 460 pages, 8vo. Price\$4.00

This book is distinctively a new and up-to-date American book. Published April 11, 1903.

Kirk—The Cupola Furnace: A Practical Treatise on the Construction and Management of Foundry Cupolas. By Edward Kirk, Practical Molder and Melter, Consulting Expert in Melting. Illustrated by 78 Engravings. A new and thoroughly Revised and Enlarged Edition. 490 pages, 8vo. Price\$3.50

An American book by an expert of established reputation. Published February 16, 1903.

The two books above named will be sent by mail at the publication prices, free of postage, to any address in the world, or by Express, C. O. D., freight paid, to any address in the United States.

Van Der Burg—School of Painting for the Imitation of Woods and Marbles: As Taught and Practiced by A. R. Van Der Burg and P. Van Der Burg, Directors of the Rotterdam Painting Institution. A Complete Practical Treatise on the Art and Craft of Graining and Marbling with the Tools and Appliances needed. Illustrated by 86 Plates. Fourth Edition. In one Volume Folio, 12x20 inches. Price\$10.00

The above book will be sent by Express, freight paid, to any address in the United States or Canada, at publication price.

This magnificent work comprises not merely the elegant engravings of the finished specimens of Woods and Marbles, but the drawings and the descriptions of the brushes, combs, and other tools needed. It also illustrates the work as it is to be performed by the grainer from the most elementary lines and forms to the completion of the Woods and Marbles which he desires to imitate. Any painter of ordinary intelligence can by the thorough study of the work of Messrs. Van Der Burg make himself a finished grainer. No other volume in the English language on this important subject that has ever been published, compares with it in value and elegance.

Elaborate circulars, showing full tables of contents of the above valuable books, will be sent free to any one in any part of the world who will send his address.

HENRY OAREY BAIRD & CO.,
INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,
310 Walnut St., Philadelphia, Pa., U. S. A.

SITUATIONS WANTED.

A YOUNG MINING STUDENT WISHES POSITION with a mining company, or assistant to engineer to gain practical experience. Good practical experience in official work, and some technical. Address C O B, this office.

CHEMIST—YOUNG MAN, UNIVERSITY graduate in chemistry and assaying, some experience, desires position as chemist or assistant with mining, analytical or manufacturing firm. Address "Cinnabar," care of this office.

COMPETENT MILLMAN, MACHINIST AND Chemist. Experience free mill and concentrating. College education. Have built and operated mill in Montana for 12 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's bank. References the best. Address H., care of this office.

CYANIDE MILL OR ASSISTANT GENERAL Superintendent. A thorough chemist and assayer. Technical graduate. Treatment of low grade ore a specialty, also construction. Understand Spanish. Will go anywhere. Reference Al. Address "Competent," care of this office.

METAL., MINE AND MILLMAN AND SUPT. open for engagement at May 1st; 20 years' western U. S. and Mexican mining and milling experience. Also undertake cyaniding and assaying. Address B., Box 88, El Paso, Tex.

MINING SUPERINTENDENT, FOURTEEN years' successful experience in management of mine, with best of references, desires situation. Address N. F., this office.

WANTED.

Wanted, to interest capital in a valuable placer claim suitable for DREDGING ONLY. Address "Placer," care of this paper.

WANTED.

ELECTRICALLY DRIVEN DIAMOND DRILL (Sullivan Drill preferred)

with swinging head and pump connected, capable of drilling 300 feet, adapted for underground work, and requiring about 6 H. P., rods ranging from 1 to 5 feet. Apply 228 Crocker Building, San Francisco, Cal.

Wanted—A Superintendent

For foundry, forge, machine and boiler shops employing 20 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answers confidential. Address Z., P. O. box 153, Station C, Los Angeles, Cal.

WANTED.

Metallurgist and Smelter is open for engagement to take charge of copper property. Thoroughly experienced in mining and treating low grade ores. Position preferred in Latin America. Al as assayer and analyst, age 35, single, excellent references. Address "Cobre," care of Mining and Scientific Press.

CAPITAL REQUIRED.

The owner of a mining claim, situated in one of the leading districts of California, at present being developed, is desirous of disposing of a one-half interest, the amount received to be expended upon the property. This is a legitimate and promising enterprise. For further particulars address Box 21, this office.

FOR SALE FOR CASH OR WILL BOND.

ONE FULL CLAIM with water right and millsite. Partially developed. Prospects well in free gold. Will stand full investigation. Will deal with principle only.

Address J. M. QUINN, Big Oak Flat, Cal.

FACTS WORTH KNOWING.

You can buy a genuine Columbus Buggy Company's vehicle, at the San Francisco house, for about the same you will pay for an imitation, if you will take the trouble to investigate. The Columbus will not admit of as great a profit as cheaper stuff and many dealers say the average buyer does not know the difference. Look into the difference—it will pay you. We can show more vehicles 15 years of still running in the State of California than all the other factories combined. The freight is the same on cheap vehicles that it is on good ones. We have to have a distributing house in San Francisco for the whole coast and the islands. Big stock to select from and carloads constantly arriving. Market, between Ninth and Tenth streets, opposite St. Nicholas Hotel.

Fac-Simile of Name Plate.

[ELATERITE IS MINERAL RUBBER.]

NO MATTER WHERE YOUR BUILDING IS, OR WHAT ITS PURPOSE, YOU WANT THE BEST COVERING.

"It Never Wears Out."

ELATERITE ROOFING

Trade Mark.

EASY TO LAY. GOOD IN ANY CLIMATE. THREE WEIGHTS.

The Gambetta Mine.

In Madera county, Cal., at Gruh Gulch, is located the Gambetta mine, which in some respects is unlike the average California gold mine. The formation is mica schist and mica slate, which, with other metamorphics, are the principal rock of the district, though in the immediate vicinity is a granite mass which has a width of about 14 miles, extending westward to the low foothills bordering the plains of the San Joaquin valley. The vein is a fissure, in which respect it differs somewhat from most of the other mines of the district, they, with the exception of the Bullion vein— $\frac{1}{2}$ a mile distant, which is also a fissure—and the Josephine vein, a contact fissure, being lens-like quartz masses which usually conform closely with the strike and dip of the country rock.

The Gambetta has been developed to a depth of 860 feet and is still sinking. Levels are open at 400, 600, 700 and 800 feet. This mine affords an illustration of the vagaries and uncertainties of the trend of ore shoots. The ore shoot discovered on the surface was stoped out down to 600 feet, and its lower edge had a low dip, less than 35°, to the eastward, crossing the main shaft, sunk on the vein, and passing over 100 feet to the eastward of it, so that the shaft, though still following the fissure, exposed no ore from about the 600 to below the 800 level, but about the 600 level the shoot assumed a vertical position and then turned westward, while its upper limb still trends eastward as far, at least, as the 800, on which level the shoot is 650 feet long. The ore has come into the shaft and has crossed again to the west side.

The fissure is about 30 inches wide with a pay-streak varying from 4 inches to 2 feet. The quartz carries about 4% sulphides of iron with copper, lead and zinc sulphides in smaller amount. In the massive iron sulphides it is not uncommon to find coarse gold.

The mill and hoist buildings are built over the main shaft. The accompanying engraving is an illustration of the mill. The surface equipment consists of one 45 and one 60 H. P. hoiler, steam hoist and Huntington 5-foot mill with two 6-foot Frue vanners. Oil is used for fuel. Amalgamation is practiced in the mill and on outside plates. The tailings assay about \$2 per ton. The concentrates are worth \$180 per ton and are shipped.

A short distance south of the Gambetta is the Josephine vein, which strikes toward the former, and if the respective direction of the strike of the veins is maintained they should meet about 1000 feet west of the Gambetta shaft. The Josephine occurs at con-

The Gambetta Mine, Madera Co., Cal.

tact of granite and slate and has been worked extensively to a depth of about 600 feet. It was formerly equipped with steam hoist, 20-stamp mill and chlorination works, but the mine was dismantled about 1890 and has since been idle. It is owned by the Gambetta Co. It is thought that some interesting developments may be made when the union of the Gambetta and Josephine veins is reached.

Cost of Mine Timbering.

The timbers comprising "one set" in the square set system consist essentially of eight pieces, viz., four posts, two caps and two ties. Where the system is extensive—that is, where set follows set horizontally and vertically—then the two posts on any side form a side of the adjoining set. In proceeding upward the caps and ties are not similarly counted. In certain modifications of the square set system, which have been introduced in some regions where round timbers are used almost exclusively, two timbers are sometimes employed in place of the tie of the regulation square timber set, these two then being called "sprags." In this case the set would consist of four posts, two caps and four sprags, making ten timbers instead of eight. Where sills are used it is unnecessary to consider them as constituting a portion of a regular set. Where angle braces are regularly inserted in each set, this would

add two timbers to the set. As a matter of course, along the walls of the vein the posts may or may not come in close proximity to the walls. In any event, butt caps or sprags are placed, reaching to the wall, to render the whole structure rigid, but these are not considered as constituting a portion of a regular set. Each lot of timbers inclosing the rectangular space included by them is considered a set, but it does not follow that, because there are twenty-four such spaces so included in a stope, there are twenty-four times eight timbers in the several sets. In a stope containing four sets wide across the vein and six sets along the vein, there are on the sill floor thirty-five posts, twenty-eight caps and thirty ties—a total of ninety-three timbers, or an average of $3\frac{1}{2}$ timbers per set. In figuring the cost of timbering per ton of ore extracted, an approximation only can be reached, but this may be figured very closely and should include original cost of timber, cost of handling on the surface, framing, sending into the mine and placing in position, together with the cost of the necessary hitches that may have to be cut for placing posts, caps or sprags. Lagging should also be included, though often these latter may be recovered and reused elsewhere, when the same may be credited to the stope from which they were removed.

Special timbers cut to measure, such as "sprags" and "butt caps" or "cap sills" must also be charged as well as the blocking and wedges used in the stope. Chute building and maintenance may be charged, like tracks, to a separate account.

The cost of timbering in square sets per ton of ore extracted varies greatly, but usually ranges from 20 cents under favorable conditions, as to cost of timber, character of mine, etc., to 50 or 60 cents under more expensive and less satisfactory conditions. The variable cost of labor also is important, as well as the size of timbers employed. Where very large timbers are used the timber gang from necessity is larger than where the timbers are relatively small, more men being required to handle the large timbers, which are often 30 inches or more in diameter, weighing upwards of 1000 pounds. Of course, filling, where practiced, cannot be charged to timbering, but made a charge under mining expense.

New Metallurgical Processes.

New metallurgical processes have for many years been a hobby with some men, and among them have been some of the most ingenious and at the same time most worthless combinations of chemicals, mechanical devices, and varied applications of heat, that the human mind can conceive, but there also have been those of real worth—processes that have revolutionized the practice of gold treatment in some districts. Notable among these are the cyanide and harrel-chlorination processes, with their modifications, and more recently the successful application of the bromine process. Smelting has also advanced to a remarkable extent within the past decade. In this direction pyritic smelting, though not a new method of ore treatment, has been successfully applied in the United States, first at Deadwood, S. D., by Franklin R. Carpenter, and later by others at numerous places. In the early history of Colorado smelters were built in almost every camp of prominence, but the knowledge of the smelting was not sufficiently advanced at that time to make success always possible, and in many instances these old plants, erected at great expense, owing to lack of economical transportation facilities, may still be seen, usually monuments to misdirected enterprise. Mills supplanted smelters on every side and made the operation of the mines possible at a profit. Milling in time became reduced to a science, and within recent years, with cyanide or chlorination plants as accessories, ores containing low values are made to yield a profit. But since the advent of successful and inexpensive pyritic smelting the smelters are again coming into favor in many places, but where these are advised and operated by those who have the technical knowledge and the skill which comes with experience, success instead of failure results and may be anticipated. In some instances, where the wet methods and pyritic smelting are in competition for custom ores, the smelters have been able to meet the charges of the mills, but this can only be possible where every condition is favorable to the smelter. The obtaining of the necessary fluxes with ore of suitable character is important. A pyritic smelter located at a distance from cheap limestone can hardly compete with a cyanide or chlorination works of equal tonnage capacity,

where conditions are more favorable to the latter class of reduction works.

This is an era of investigation, and the "process men" still have a wide field for the exercise of their ingenuity, for no one believes that the best has yet been attained in the realm of metallurgical experience. Most of the investigation is being carried out along scientific lines, and little that is valuable is the result of accidental discovery.

More Mine Strikes.

California is the present storm center of strikes among mine, mill and smelter employes. The disturbances in northern California copper mines are being duplicated in central California gold mines. In Amador county, a great gold-producing section, about 1000 men, mostly miners, have ceased work this week. Their demands are for eight hours as a day's work, reinstatement of men who, they claim, were discharged because of affiliation with the miners' union, and recognition of the union. The mine owners are willing to concede all that they can and continue to operate, but deny the right of any employe to dictate who shall or shall not be employed. The real demand is recognition of the union and the employment of none but union men.

The situation in Amador county is different from that in northern California, where the strife is still on; or in Colorado, where arbitration and compromise enabled a resumption of operations. In central California the gold mining business is run on a narrow margin—so narrow that many mine owners and operators are indifferent as to whether they go on or not. So that in case of a continuance of this week's labor disturbances it is not likely that any attempt will be made to import new men to take the places of the strikers. The mines will simply shut down and all operations cease. It is difficult to see what else the mine owners can do. As things have been going they have just about managed to do necessary development work and keep the mines going miner fashion. Of course, they might have gouged the eyes out of the mine, stripped it of its richest ore, and made a temporary spurt of fictitious prosperity, but that is not the California fashion. There is, or was, a fair day's wages for a fair day's work, and in the most of cases a prospect of sufficient profit to keep going. It seems a pity that these things have to be repeated and the same lessons learned over and over again. The only pleasant feature of the present California mine labor disturbance is the unlikelihood of loss of life or destruction resultant upon any armed collision. Of course, the men are losing their wages, the local business communities are losing their ordinary trade, and the mine owners must necessarily share in the attendant loss inevitably occasioned by the cessation of work in an actively operated mine, where constant work is required to keep down the water.

There is much difference in the amount of damage resulting from the flooding of mines in different districts. Where the country rock and the veins are generally hard, as in the Cœur d'Alenes, as determined after the strike there, it was simply a matter of expense in removing the water, when the workings are found intact, with possibly local exceptions; but the character of most of the mines in the gold belt of central California is such that their flooding would mean large expense in any event, if not the complete destruction of a large portion of the underground workings on the vein. This is due to the wide zones of gouge and foliated, soft slate usually accompanying the quartz veins or filling the barren portions of the fissures. When the water rises in these mines great damage results to shafts sunk in the vein, as most of them are; and to levels and stopes. With a complete knowledge of these facts the miners have doubtless given them due consideration before deciding to strike, believing that the several companies could not afford to allow such a condition to obtain, while apparently losing sight of the fact that in some cases the companies are already operating at a loss. That the owners have also weighed this contingency is evident, as the Kennedy company have planked the collars of the several shafts on their property, and it is announced that other mines will do the same. Although the mines of the district affected by the strike are all deep, mostly 2000 feet and over, and are extensively de-

veloped, they are not very wet mines, and the amount of water that would accumulate daily is relatively small when compared with the large excavations in the lower levels, and it would be months before the water would rise to a height sufficient to do irreparable damage; and knowing this to be so the owners have decided to close up for the time, if not permanently.

To argue or discuss or moralize over the situation were useless. Countless columns have been written on this subject in the last twenty-five years. The "strike," as we know it in the United States, is the result and accompaniment of prosperity. Men are singly "striking" all the time somewhere. The man who has made a million and quits work "for good," shows one kind of a "strike." Some men who get \$100 ahead of the world, just as soon strike as not. When the \$100 is spent they are ready to go back to work. Others stand in because they are afraid of being called "scabs." Others strike with an idea that in so doing they are "getting even" with somebody. Others strike because they are told to; a few strike because they faithfully believe that in this way they are advancing the cause of labor, upholding its dignity, hastening the day when there will be better times for all.

Meanwhile the thing is in the air; it is endemic and epidemic. It must run its course in Pennsylvania, California, British Columbia, Colorado, and when the cycle of fat years is followed by the inevitable cycle of lean years, and "hard times" come around again, the present surfeit of strikes will have surcease, and we will all be glad of a chance to have some honest day's work to do.

Bunker Hill-Last Chance Decision.

The long-contested suit of the Bunker Hill & Sullivan M. Co. vs. the Last Chance M. Co., in the Cœur d'Alene district, Shoshone county, Idaho, has been decided by Judge Truitt, master in chancery, in favor of the former company. The litigation involved the extralateral right. The peculiarities of the geology of the district have resulted in a large number of suits of similar character. The mining law requires a locator to take his claim along the croppings of the lode, and he is supposed to pay no attention to the true strike of the vein, but takes his course along its apparent strike. This results in a varying "strike" where the vein dips greatly from the horizontal, and where the topography of the country is rugged. This is the condition in the Cœur d'Alenes, and claims have been laid out along the vein for thousands of feet, these claims having a greatly differing strike, with end lines drawn at many angles. In the case of the Bunker Hill & Sullivan the foot wall of the vein crosses the claim, passing through the side lines. The court has held that the mine is entitled to extralateral right, though the side lines became the end lines. There are many other similar cases in the district, some like that of the Bunker Hill & Sullivan, where the side lines must become the end lines, and others where the end lines are actually crossed by the vein in its apparent strike. In these several contentions the priority of location is an important factor. Where the extralateral rights of two or more claims conflict, the court has granted the right to follow the vein in the direction of the end lines (or the side lines, as the case may be), projected beyond the boundaries of the location on the dip of the vein, but the prior locator takes all the ore in the place of intersection. The right of way is given to each claim, however, through disputed territory, when they may take up the extralateral right in the region beyond the area of conflict.

THE petition for a new hearing in the case of the Argonaut M. Co. vs. Kennedy M. Co. of Jackson, Cal., has been denied by the United States Supreme Court, which recently rendered a decision in favor of the Argonaut Co. This litigation has been in progress for more than eight years, though the Kennedy has operated steadily during this time. The Argonaut Co. worked steadily from 1893 until about two years ago, when they were obliged to suspend on account of the pending litigation. The Supreme Court had given a disputed triangular strip of ground with increasingly greater width in depth to the Argonaut Co. and within this lies ore bodies estimated to be worth not less than \$2,000,000.

CONCENTRATES.

NAILS can sometimes be dispensed with in a lead assay by the use of cyanide of potassium in the flux.

REPLYING to Mazama, Wash., in relation to a constituent of an alloy that looks like gold, magnesium carbonate is meant.

THE best place to learn drill sharpening and tempering is in the blacksmith shop of a mine, where the seeker after information of this class may not only learn by observation, but actually have a hand in the work.

PYRRHOTITE is the monosulphide of iron and is magnetic. In this connection it is interesting to note that some of the pyrrhotite deposits of Sbasta county, Cal., are overlain by a gossan, bearing magnetite—a magnetic iron oxide.

A "CORD" of ore is a unit of measurement in use in Gilpin county, Colorado, and is the equivalent in bulk of a cord of wood—that is, 128 cubic feet. It contains from seven and one-half to nine tons of ore, according to the kind. The ton weight is also in use in the district.

By the "valence" of an atom is meant its capacity to hold in combination other atoms or groups of atoms. Hydrogen which appears to never possess a valence greater than one, has been adopted as a measure of valence. Water is represented by HOH and is written H₂O.

It is never advisable to attempt to "dress" amalgam plates in a stamp mill without first hanging up the stamps, as any gold loosened by the brushes or brooms is likely to be lost if this is not first attended to. The plate should be carefully washed with clean water, but with only moderate pressure, before the dressing begins.

THE sample of pulverized ore from Jerome, Ariz., is micaceous hematite—an iron sesquioxide. This ore occurs in small veins in many places in Yavapai county, Arizona, and near Castle creek a deposit was worked in 1890 which was gold-bearing. The ore in this instance was made up of larger, bright metallic scales, but otherwise resembled the sample.

COPPER ORES containing a large amount of zinc were an undesirable class of ore prior to the recent introduction of electro-magnetic separators, as the copper smelter did not want the zinc and the zinc smelter did not want the copper, and in either works there was a loss; but by employing the magnetic separator two clean products are obtainable, both of which are marketable. Iron with copper ore is not a disadvantage, but it is undesirable with the zinc.

SILVER CYANIDE is similar in its various properties to the chloride, bromide and iodide of silver, and separates as a white precipitate when a solution of hydrocyanic acid is added to silver nitrate. It is insoluble in nitric acid, but easily soluble in ammonia, and is not affected by light as chloride of silver is. It dissolves in a solution of potassium cyanide, which on evaporation yields crystals of KAg(CN)₂, which are soluble in four parts of water, but are permanent on exposure to the atmosphere. This compound is employed in electro-plating.

LIMONITE (brown iron ore) is often called "bog iron ore," but all limonite is not of similar origin. In many mines, other than those worked for their iron values only, limonite occurs abundantly as a result of the oxidation of sulphide ores. This is the case at Leadville, Colo., and at many other places. The gossan covering copper-bearing deposits usually consists largely of limonite. The so-called liver-colored iron ore of lead-silver districts is generally a siliceous limonite, often colored by manganese. These ores in precious metal mines are valuable as a flux at smelters, but are not often worked for the iron they contain.

RIFFLE BARS are sometimes made of steel 1½ inch square, cut in uniform lengths of 6 feet each, the bars are to be square, of exact dimensions, accurately straight, free from wind or twist, and cut off square at both ends. Each bar is to be bored with five holes for ¾-inch spikes, countersunk ¼ inch deep for ¾-inch spike heads, the holes to be spaced 3 inches from ends of bars and 16½ inches apart. The steel riffle bars are mounted on 1½-inch by 6½-inch surfaced pine bars, the steel cleats fastened with ½-inch by 1½-inch wood screws. The riffles are laid in the sluices longitudinally and wedged slightly from each side to keep them in position.

DIAMONDS have been discovered in the United States—in Georgia, North Carolina and California—and have been reported in Wisconsin. All of these have been found in the alluvial, none in the gneiss rock. In each of these localities the peculiar quartzose bydomica schist, itacolumite (also called flexible sandstone), has been found, also in Brazil, South America, and in the Ural mountains of eastern Russia, where diamonds are also found. In South Africa the diamonds occur under different conditions. All of the California diamonds have been found in the beds of ancient streams or in gulches

which have cut through them. No diamonds of great value have been found in the United States.

It has been suggested that the surface of tailings dumps may become enriched by the blowing away of the lighter portions, leaving the heavier grains of sand behind with the values. This may be true in some instances, but it seems to be a matter of easy determination in most cases. The tailings may be screened through a 200-mesh sieve, that passing through representing the slimes, that remaining on the screen representing the coarser portion which would probably not be blown away. If, on careful assay, the slimes were found to be richer than the coarser material, as is usually the case, then it might be assumed that the surface of the dump would be impoverished by the drifting of the wind.

BROMINE does not exist in a free state in nature, but always in combination with metals. It is found in small quantities in many springs and in sea water. A large portion of the bromine of commerce comes from salt springs in West Virginia. It is a dark red, volatile liquid, which freezes at -7° F. and boils at 63°. In handling bromine care must be taken not to inhale the fumes, as it is poisonous, and also corrosive to the skin. It may be obtained from bromides by the action of manganese dioxide and sulphuric acid, in the same manner that chlorine gas is evolved from sodium chloride. In a general way bromine resembles chlorine. It is being employed as a substitute for chlorine in the extraction of gold from its ores at some metallurgical works.

HYDRAULICKING with compound centrifugal pumps may be accomplished satisfactorily under favorable conditions. A three-step 10-inch pump will deliver 225 miner's inches under an equivalent of 150 feet head, requiring 160 H. P. boiler. A three-step 10-inch pump will deliver 200 miner's inches under 200 feet head, with 160 H. P. boiler, and a three-step 8-inch pump will deliver 150 miner's inches under equivalent of 200 feet head, with 124 H. P. boiler. It is suggested that a smaller nozzle than 5 inches be employed, as 5-inch nozzle under 100 pounds pressure, which represents 230 feet head, requires about 1000 miner's inches of water. It is also suggested that a pump be utilized to throw a large volume of water under low head, say 25 feet, to furnish a sufficient volume of water to wash away the gravel piped down by the giant. This is presuming that a large volume is not available for this purpose in the creek bed.

THE sulphide of zinc is technically known as sphalerite, or in German as "blende," and in French "zinc sulfure." The mineral known to Cornish and many other miners as "black jack" is one of the most interesting of minerals. When pure it contains 67.15% metallic zinc, but it usually contains other substances than zinc and sulphur. The most common impurities are iron, manganese and cadmium, and more rarely mercury, lead and tin. Small amounts of gallium, indium and thallium are found in some zinc blende. It is often auriferous or argentiferous. When pure, blende is white or nearly colorless and transparent, but more commonly honey yellow, resinous, or brown to black, occasionally red or green. Its hardness is 3.5 to 4; brittle. With soda on charcoal it gives with the blow pipe after roasting a beautiful green flame. A convenient test is a drop of hydrochloric acid, which evolves sulphuretted hydrogen.

KUTTER'S FORMULA for measures in feet is as follows:

$$v = \left\{ \frac{1.811}{n} + 41.6 + \frac{.00281}{s} \right\} \times \sqrt{rs}$$

$$v = \left\{ 1 + \left[41.6 + \frac{.00281}{s} \right] \times \frac{n}{r} \right\} \times \sqrt{rs}$$

v = the mean velocity in feet per second; r = the hydraulic mean depth in feet, which equals the area of cross section in square feet divided by wetted perimeter in lineal feet; s = the fall of the water surface (b) in any distance (l) divided by that distance, $\frac{b}{l}$ = sine of slope;

n = the co-efficient of roughness, dependent upon the nature of the lining or interior surface of the channel. The value of Kutter's formula depends almost entirely upon the selection of the proper co-efficient of roughness, n. A proper knowledge of this can only be obtained by experience and the comparison of a large number of experiments on the flow of water in different channels. For cast iron pipes it is usual for engineers to assume .013 = n. Most hydraulic engineering books contain tables giving the value of n under the varying conditions in pipes, flumes, ditches, etc.

AS TO the probable cause of the breaking of a pillow block on an engine at Folsom, Cal.: The exhaust system as arranged, though unusual, is apparently not defective. The cause of the breaking of the pillow block was evidently not due to water condensed in exhaust pipe, as within six minutes all the water in that system of piping must have escaped from the vent. It is possible that during the stoppage water may have condensed in the steam pipe leading from boiler to engine, and that on turning on steam suddenly the water, being unable to escape quickly enough through the cylinder cocks, may have caused the breakage. It is possible, also, that a nut may have become loosened in the cylinder, which would cause a breakage or a stoppage of the engine. It is difficult to determine the actual cause of breakage under the circumstances and conditions de-

scribed. Those on the ground have the best opportunity to decide this, but it was not due to water in the exhaust pipe. It is suggested that the open vent at point marked "B" on the drawing be placed on the lower side of the pipe, to more completely drain it, and that the vent be made larger and be provided with a valve. When first starting up, this to be left wide open, but partly closed after the pipe line is well warmed up. The passing of the exhaust pipe through the water tank causes a large condensation of steam in the pipe, which must have a ready exit.

A METHOD for determining the amount of copper in ores generally considered reliable is by electric deposition. Essential conditions are a sufficiently dilute solution, not an excess of free acid, and not too strong an electric current. If these conditions are not present the copper will be spongy, dark colored and difficult to wash. Hydrochloric acid or an excess of nitric acid must be avoided. Arsenic, antimony, bismuth or silver, if present in solution, will cause the copper to be impure, bismuth being particularly undesirable. Should either of these elements be present in the ores they should be removed before precipitation is attempted. Copper determinations by the cyanide method are made as follows: Treat the charge of ore one gram in 7 c.c. of concentrated nitric acid, with 5 c.c. sulphuric acid and 2 c.c. of hydrochloric acid in a 250 c.c. flask. Boil until only sulphuric acid remains and white fumes appear. Cool, add 10 c.c. water and boil until ferric salts are dissolved; cool and add 6 grams pure granulated zinc. Shake the mixture for five minutes, dilute to 50 c.c., and add 20 c.c. of sulphuric acid. When the zinc is dissolved fill the flask with water, let the copper settle and then decant off the water. Wash in this manner, by addition of water and decantation, at least twice. The liquid decanted off should be tested for copper with hydrogen sulphide water. Should it show copper, repeat the assay or filter off the copper sulphate and determine it. Add 5 c.c. of concentrated nitric acid to the residue in the flask, and boil until the copper is dissolved and the red fumes expelled. Dilute the solution to 125 c.c. If silver is present a drop or two of hydrochloric acid will precipitate it. If more than a trace of silver chloride appears filter it off. Add 10 c.c. of strong ammonia. The solution will assume a blue color of greater or less intensity depending on the amount of copper present. Run in a standard solution of cyanide of potassium (made by dissolving 42 grams of pure cyanide of potassium in one liter of water, which gives a solution equivalent to 0.01 gram of pure copper in 5 c.c. of concentrated nitric acid) until color is nearly discharged. Pour the solution on a large ribbed filter and let it all run through. Dilute the filtrate to 180 c.c. and finish the titration. It should only require a little cyanide solution to finish the titration in the filtrate; the little required by the copper left in the insoluble residue and oxide of iron in the filter can be disregarded.

THE right of a junior mineral locator to follow his vein on its dip under patented railroad land has not been determined by the Supreme Court of the United States, and there is a difference of opinion as to the extralateral right in such cases. The United States patent guarantees (presumably) to the patentee of agricultural and railroad lands (returned and supposed to be non-mineral), all the surface and all underneath the surface to the center of the earth. It also grants to the mineral locator having his apex on Government land the extralateral right, whether the claim be patented or not. It will probably require a lawsuit carried to the Supreme Court of the United States to determine this question. If, however, the mineral location were made prior to issue of patent for railroad land, the mineral locator may take the extralateral right. Of this there is no doubt. The case of the Amador-Medean G. M. Co. vs. South Spring Hill G. M. Co. was a case similar, the essential difference being that the Medean was agricultural and not railroad land. These properties are near Amador City, Cal. In this case land was entered as agricultural, the locator paying for the land and receiving a receipt for the same, which was treated by the court as equivalent to a patent, though patent did not issue until later. About two years after the entry of this land another party located and acquired the right to a gold mining claim adjacent to the said agricultural land. This man sold to the South Spring Co., and the agricultural locator who subsequently discovered mineral on his land sold to the Amador-Medean G. M. Co. The South Spring Hill Co., in working their vein, followed it downward across their east side line and underneath the surface of the property of the Amador-Medean Co. The action was ejectment, to recover the possession of that portion of the vein lying underneath the surface of the agricultural patent. The patent contained after the granting clause the following: "And also subject to the rights of the proprietor of a vein, or lode, to extract and remove his ore therefrom, should the same be found to penetrate or intersect the premises hereby granted as provided by law." It is held that the insertion of this clause was of no effect unless it was sustained by law. It is the law and not the instrument of conveyance that creates the reservation. Judge Sawyer of the Ninth U. S. Circuit Court decided in favor of the agricultural patent. The case was carried to the Supreme Court of the United States, but the suit was dismissed by reason of the South Spring Hill Co. having bought the Amador-Medean property, consequently leaving the question still undetermined as related to agricultural land.

Hydraulicking Low-Grade Gravel.

Written for the MINING AND SCIENTIFIC PRESS by
P. BOUVERY, E. M.

Under the title "Hydraulic Mining in Low-Grade Gravel," the MINING AND SCIENTIFIC PRESS of Nov. 16, 1901, published a very interesting study giving results obtained by working this kind of gravel. If they are not quite satisfactory, financially speaking, they are at least of value to the engineer.

Guided by that note, we give the following results connected with the same ideas and encouraging to the owners of such placers.

The placer of which we write is in California. Capital has been invested for the purchase of the ground and for the water. This is conducted to the mine by a trapezoidal flume, followed by a ditch, making a total length of 30 miles, with a capacity of 3000 miner's inches. The nature of the ground through which the ditch has been dug, the steep slope of the hills and the inclemency of the winter months are the chief causes for the large expenses of maintenance, being about 22% of the total amount of operative expenses.

During the first years of its existence the company owned a water right which in the years of heaviest rainfall flowed over 450,000 miner's inches annually. Since then they have extended the water rights, and are now able to conduct to the mine, according to the winter, from 650,000 to 750,000 miner's inches annually.

This large supply of water—an average of 3000 miner's inches per day during eight months—can not be utilized constantly with profit in the same place. It is necessary for good work to secure several points of attack, allowing changes to be made as well as for moving giants, cleaning up, etc.

The water supply last season was used in the following way:

First mine.....82%
Second mine.....13%
Electric light, derricks, irrigation, etc.....5%

The difference in the use of the water in both mines has been intentional, founded on the nature of the bank to be washed. One is soft gravel, broken up for over 1 mile in length; the other, on the contrary, is a very hard cement, which for profitable working necessitated a special installation of our power plant last year. All our efforts have been concentrated on the first mine, working the second only in case of necessity. We can say, however, and this will seem strange, that twice during the year we ordered the water turned off, preferring to lose it than use it at a loss; but the further results amply counterbalanced the previous losses.

What is said applies equally to both mines, though at the second the results are not so satisfactory as at the first, which, consequently, decreased the average. The expenses and returns of both mines are included in a table below, to furnish an average.

The geological study of the placers worked is very interesting. The formation belongs to two different ancient deposits, the first constituting a lake bed, the second filling the lake. Both formations are gold-bearing gravels, with boulders of every size, from the pebble to the boulder of two and three cubic yards, and requiring water, powder and derrick for their removal, for which purpose the mine is well fitted. The smaller boulders are removed by derrick and cable, the large ones being first blasted.

The bank is broken down by four giants—one at the front, with a head of over 400 feet and nozzle from 7 to 9 inches, according to requirement. Two giants operate on the left side, with a head of from 150 to 250 feet, and one on the right side, with a head of 500 feet, to break the hard cement.

The method of working is the result of long and careful observation and experience and is as follows: Run heavy and keep the sluice clean. Although not easy to do, we have succeeded, and to this we attribute our satisfactory result.

The bank to be washed fills a gulch, the sides of which slope about 30°. On the left it lies on a hard and even bedrock (diorite); on the right it lies on blue clay, resting on decomposed granite, and varies in thickness from 5 feet to 250 feet, containing gold throughout.

Broken by the side giants, the bank is prevented from sliding forward too much by the giant on the front. (We have seen within twenty-four hours the bank sliding forward 100 feet.) By slide is meant the caving down and forward movement of the gravel produced by piping. There is no power strong enough to stop these slides; consequently, the head of the sluice is always far away from the bottom of the bank—about 150 feet—where the front giant is always set.

The sluice is 6 feet wide and 4½ feet high. At the beginning of the last mining season we had but fifty-six boxes, 12 feet long, and at the end of the season 116 boxes, of which fourteen new boxes were at the head and forty-eight boxes at the tail. The grade is 8 inches per box; the pavement is wooden blocks in the first ten boxes and boulders in the others. Two undercurrents collect the fine gold very satisfactorily.

We say the gravel is of low grade, because, in fact,

the numerous prospects panned during the season show an average of from 4 to 6 cents per cubic yard. (We exclude here the prospects which induced the company to buy the property.) Despite this small percentage of gold, we have reached satisfactory results. For the purpose of comparison, in the following table are given the results of several years' operations, those of the last year being the only ones covering our personal management. As to give the figures representing the number of miner's inches and the returns per inch would be incompetent, we have referred to the full result of the expenses and returns, in order to point out, first, the cost; second, the returns, and, by deduction, the cost per dollar of gold produced:

COST AND RETURNS PER MINER'S INCH.

	1895.	1896.	1897.	1898.	1899.	1900 (9 Mos.)	1900-01.	1901-02.
Cost.....	\$0.136	\$0.106	\$0.095	\$0.1004	\$0.866	\$0.0081	\$0.0855	\$0.08219
Returns.....	0.136	0.125	0.136	0.503	0.100	0.0738	0.0665	0.1418
Cost per \$1 extracted.....	1.000	0.85	0.705	0.972	0.862	0.924	1.289	0.5822

The cubic volume of gravel washed out is practically not obtainable, because, being over 1 mile long, the outside lines of the bank are constantly changing. Without calculating mathematically, we estimate between 2½ and 3 cubic yards as the quantity of gravel washed per miner's inch the last year. The area washed, as compared with the preceding years, shows by rapid triangulation that it was about 2.5 cubic yards more than before. The gravel being exactly the same, the form of the bedrock and its nature remaining identical, we are able to deduce that we have washed more ground and sluiced more gold-bearing gravel.

In order to obtain such results, we have applied the following principles:

1. Increased pressure on the giants.
2. Heavy run in the sluices.
3. Increase of personal responsibilities and, consequently, decrease of some salaries.
4. Decrease of the employees, by using more water power.
5. Three times a week careful inspection of flumes, pipe line, sluices, derricks, etc.

The percentage of gold in the sluices, running full or low, is the same and is distributed as follows:

First recovery first 15 boxes.....73.5%
Second " 30 "13.4%
Undercurrents.....11.5%
Third recovery below undercurrents.....1.6%

Showing that a long sluice line is unnecessary, the coarse gold stops always in the first boxes, the fine being caught by the undercurrents.

To know exactly the proportion of the expenses during the running year, and thereby to try to effect some economies, the figures in the following table give expenses by category and by miner's inch:

CLASSIFICATION OF THE EXPENSES BY CATEGORY AND MINER'S INCH.		
Piping-sluicing.....	\$0.01224	15%
Lengthening sluices.....	0.00073	
Moving machines.....	0.00045	
Moving derricks.....	0.00071	
Removing boulders.....	0.01285	16%
Cleaning up.....	0.00065	
Electric light.....	0.00134	
Blacksmithing.....	0.00136	
Carpentering.....	0.00187	
General repairs.....	0.00507	
Lumber and powder.....	0.00668	
General supplies.....	0.00422	
Maintaining ditch.....	0.01534	22%
Supplies, ditch.....	0.00247	
Reservoir.....	0.00110	
Stable, wagons.....	0.00110	
Taxes.....	0.00422	
General expenses.....	0.00979	12%
	0.08219	

This table shows that 50% of the expenses proceed from: Ditch, 22%; sluicing and piping, 15%; general expenses, 12%; the full amount of others making a series of details not easy to eradicate in running.

As the author of the note published in the MINING AND SCIENTIFIC PRESS of Nov. 16, 1901, truthfully says:

"If results are not yet satisfactory for the stockholders—it is very hard to satisfy them—they show that low-grade placers can be worked with some profit, although it is not so easy to work this kind of placers in comparison with high-grade placers, because the smallest wasting of money can imperil the future welfare of the mine.

SENTIMENT does not prevail in mining. In a few instances outcrops containing values have been spared because they were picturesque, and similar sentimental ideas have occasionally been noted, but ordinarily the miner cares little for scenery, preferring to run it through his mill or smelter if it can be done at a profit.

Opportunities in Mining for Small Investors.

TO THE EDITOR:—It is sometimes said, and with a show of truth, that there are only two classes of people who can with propriety engage in the mining business—those who have plenty of money and can afford to lose it, and those who have nothing to lose. Whatever the truth in the statement it will be found to apply equally to almost any form of financial investment where the promise of returns is at all attractive. Given an investment that has no risks, and the returns will be so small that it offers no in-

ducement for the small investor who desires from his investment something more than the 3% or 4% he receives from the savings banks. Whether a man should withdraw his money from the savings bank or convert his 3% bonds into cash for the purpose of investing in something more promising is his own affair; undoubtedly he takes chances in doing so. But men and women are constantly investing their money in this and that form of enterprise or speculation, from real estate to lottery tickets, and if the truth could be known it would probably appear that a large proportion of these investments are made where the risk is greater and the promise less than in gold mining. There are two methods by which the possessor of small capital may invest in mining: First, by the purchase of mining stocks, and, second, by engaging directly in the business itself, either alone or with trustworthy partners. The first method is largely a speculation. If the mine is good, if it is wisely handled, and if its business is honestly conducted, it will pay. Even with a good mine it is evident that the chances are considerable, and the small stockholder has little to say in the management of the business into which he has put his money. The second method is the safest and most attractive. The field is, of course, not open to men with a few dollars, but on the other hand it is certainly not closed to the man who can control a few thousand. The real gamble in mining is with the prospector. From the time the prospect is found, its development into a mine, or its abandonment, is a perfectly legitimate and ordinarily safe business affair. Not every prospect makes a mine, hardly one in a hundred gets beyond the prospect stage. Only a very few have the "ear marks" of promise, the balance may be safely rejected. Of the few that are promising a large percentage will be eliminated by a small expenditure of labor judiciously applied; one in a hundred, perhaps, will stand the test of examination and development.

Through this work, as indeed through all subsequent work of mining, the investor must be guided by intelligence born of experience; if he lacks experience himself he must secure the services of some experienced man whose intelligence and integrity he can rely upon. Having found a prospect that stands the test, every effort should be expended toward the development of the ore body. There should be no money expended for a mill until sufficient ore is developed to pay for it. Mistakes of this sort are too frequent; in the case of large capital they are blunders, in the case of small capital they are crimes. When the prospect has become a mine, and a mill is needed, great care should be taken to determine by what method the values may best be saved. Samples of the ore, properly taken, should be submitted to men who know their business and have established reputations, and their advice followed. But no method of ore treatment should be adopted that does not follow well-beaten paths. New methods are not to be indiscriminately condemned, but no man with small capital is warranted in experimenting with a new process on a commercial scale.

In gold mining, fortunately, the processes are simple; the stamp mill, or cyanide plant, or a combination of the two, will generally cover the requirements. Where the ore is soft the rotary mills have advantages; and with proper arrangements for preliminary crushing they are not to be despised even for hard rock. With any sort of a mill a good millman is indispensable. A cheap millman is a luxury only a rich concern can afford. From start to finish good management in mine and mill and office is of prime importance. Good management cannot make a poor mine pay, but poor management can soon spoil a good one.

But, it may be said, all this requires too much capital for the small investor. Not necessarily so. A man with experience can engage in gold mining with a very few thousand dollars with a better prospect of succeeding than in almost any other business.

at the present time. Competition, which kills 90% of other business ventures, never invades the field of gold mining. Lacking experience he can, either alone or jointly with others, secure a reliable and experienced man who for a small salary and a provisional interest, will devote his time to finding and developing a promising property, at a total expense of but a few hundred dollars per month, until a mill is needed. The place for the small investor to find a mine is in the mountains among the prospectors, and not often in the offices among the promoters. There are many promising prospects in California, Oregon and Arizona at the present time which with a moderate amount of development would become mines that would pay a handsome net profit if judiciously and economically handled. The opportunities along this line are more numerous than generally supposed. Big capital ignores them and the prospector cannot develop them. There is no trouble to find good prospects and no trouble to sell a "going mine." The crying need is for moderate capital intelligently applied to fill the gap between the prospector and the syndicate.

F. N. FLETCHER.

Berkeley, Cal., March 26.

Stoping With Machine Drill.

There are some deposits of ore which cannot be mined so economically by machine drilling as they can by hand drilling, and there are other deposits which cannot be mined with any profit at all when

to break a large tonnage of low-grade milling ore or of ore of uniform grade containing but little waste. A machine is an awkward thing to handle in a stope, and much time and labor will be saved by hand drilling where only one hole or a few "pop" shots are to be bored. In loose, heavy ground the concussion due to the firing of a number of deeply drilled holes may be so great as to cause the roof to cave and break down the timbers, and in some cases result in the complete loss of the stope. In ground of this character it is necessary to keep the timbering close to the working face, and the holes had better be bored by hand, as the amount of ground broken can be better regulated, and the danger of exposing too much unsupported rock be obviated.

When economy is determined by the cost per foot of driving a heading, hand drilling proves to be more economical than machine drilling except in very hard rock. The advantage gained by using machines is in feet per month, or time, which is the essence of most contracts, and a controlling element in the development of a large property.

I do not think any competent machine drill operator would use a tripod where it would be possible to use a bar. The tripod does not hold the machine so firmly as the bar holds it, and at one setting a greater number of holes can be placed to better advantage by using the bar. The tripod is a clumsy affair, difficult to set up in a stope, and it places the operator in a strained position, especially when drilling "uppers" in overhand stoping.

timber gang builds the sets up as near to them as possible. When a "round" of holes has been drilled the machines and tools are placed in the manway, which is then covered with heavy plank or stulls; an opening left in the partition of the top panel furnishes an exit from the ore chute to the manway. By working in this manner the timber gang does not interfere with the drill men, who continue at work while the timbers are being placed.

For driving ordinary levels I use 2½-inch machines, and for small tunnels I use 3 inch machines. I have tried the large machines in vertical and nearly vertical raises, and have had good men "throw up their jobs" on account of the severe labor of setting up the machines.

The limit to which the air should be compressed for use in rock drills must be determined for each particular case, depending on the hardness of the rock and the speed to be attained. In driving the Newhouse tunnel, at Idaho Springs, Colo., a pressure of 160 pounds was used; the loss of energy in expanding air from this pressure to atmospheric pressure is considerable. Basing my opinion on the meager data I have been able to obtain on the subject, I am inclined to favor the use of high pressure with a return system for underground pumps, hoists, and drills when their distance from the power plant is not too great.

The Bromine Process.

At the Telluride mill in Colorado City, Colo., the plant is now completed. The bromine process has been introduced there, and is reported in successful operation. Mechanically the process does not differ widely from the harrel-chlorination process. The ore, after passing the rolls and having been sampled, is sent through a dryer and thence through finishing rolls, and carried on a belt conveyor to large hoppers, seven in number, whence it goes to calcining furnaces similar to those in use at the chlorination works at Colorado City, excepting at the Portland works, where the Pearce turret furnace is in use. The ore passes from the roasting furnace to a belt conveyor which delivers it to large hoppers constructed above each of the twelve harrels, six being already in operation.

In the chlorination process the ore charge is delivered into the barrel together with bleaching powder (calcium chloride) and sulphuric acid, resulting in the evolution of chlorine gas.

In the bromine process the ore is charged in the same manner, but bromine salts are substituted for the chlorine-making ingredients. Each barrel has a capacity of ten tons of ore, which is charged with the chemicals and 500 gallons of water. After four hours the solution is withdrawn through a filter to precipitation tanks and bromine gas forced into lead-lined wooden towers filled with small spheres of marble. When the bromine has all been forced from the harrel, a solution of caustic soda is poured in at the top, which running down through the interstitial spaces between the spheres absorbs the bromine gas, forming a solution of sodium bromide, which is again used in the harrel. Heretofore the high cost of bromine rendered any process requiring its use too expensive, but the recovery of the bromine in this simple, inexpensive way reduces the cost to a minimum. The gold is precipitated from the solution by means of hydrogen sulphide.

One of the first bromine installations in the United States was at the Buxton mine near Deadwood, South Dakota, where it was introduced by O. P. Ankeny in 1886. The ore treated was quartzite containing gold telluride and had proven refractory to amalgamation and other processes known to metallurgical science at that time. The ore was first calcined in a vertical furnace, crushed wet in an ordinary stamp battery. In front of the battery was an ingenious device for separating the metallic iron resulting from the abrasion of the shoes and dies in crushing the hard quartz. This consisted of a strip of iron plate 4 inches wide extending entirely across a table—similar to amalgam plate tables. Beneath was arranged a series of horseshoe magnets. The pulp passing over the plate carried with it the fine particles of iron, these attracted by the magnets remained on the plate, from which they were removed by an endless belt with fixed scrapers, which moving across the plate constantly swept them to one side, where they were brushed off into a box by revolving brushes. The pulp was delivered to settling tanks, from which it was shovelled and partially dried before charging in the lead-lined rotating barrel. The extraction was higher than had been obtained by any other process tried up to that time, but its use was prohibited by reason of the excessive cost of bromine salts, as the price at that time was considerably higher than now, and there was no means of saving and reusing the bromine. At the Buxton mine the gold was precipitated in the same manner as at the Telluride mill at Colorado City, by means of hydrogen sulphide generated by the action of sulphuric acid upon commercial iron sulphide.

The bromine process as practiced at the Nellie Bly mill at Boulder, Colo., is fully described in the issue of the MINING AND SCIENTIFIC PRESS of Feb. 19, 1898.

MINING AND SCIENTIFIC PRESS

Stoping With Machine Drill.

machines are employed, yet they can be made to yield a satisfactory return when worked by hand. Machine drilled holes cannot be so advantageously placed in any form of deposit as can holes bored by hand drilling, says J. B. Guinn in Engineering News. Some "pay streaks" are so narrow that it would be impossible to win the ore with a machine without breaking an amount of waste which it would be unnecessary to break if hand drilling were adopted. Even in large bodies of ore, especially those occurring in faults where the ore is associated with more or less worthless fault material, it is advisable to break the ore and waste separately, thus permitting underground sorting and stowing of the waste. Machine drills can be used to advantage in stoping when it is necessary or permissible to drill the holes to a considerable depth in order

My experience in the use of compressed air for drilling rock has led me to favor the use of small machines and high pressures. For stoping and making raises I use a 2-inch machine, weight unmounted, ninety-five pounds, worked under a pressure of 110 pounds; I would carry a higher pressure if the plant would bear it. This machine can be mounted and operated by one man. In making raises, broken 4 feet 4 inches wide by 7 feet 10 inches long, I employ two men with two machines mounted on a 3-inch bar 8 feet long; a bar of this length will spring some, but not enough to require bracing. The raise is timbered with 8-inch framed sets, one compartment being used for ore and waste, and the other for men and timbers. The machine men work on a platform supported on stulls above the sets; when they have attained a height of about 20 feet above the sets the

Form of Mine Lease.

One of the most satisfactory methods of working mines carrying irregular sized veins of ore of variable but generally high grade is by leasing. This method is largely in vogue in Colorado, and to some extent in South Dakota, Montana and Arizona, but is less common in California, though some of the pocket mining districts of the latter State are largely operated by the leasing system. The Mizpah mine at Tonopah, Nev., was first opened by this system, and as it is a popular method of developing and operating mines in so many places there is naturally a demand for a form of lease which shall be satisfactory to both owner and lessee. Following is a form of lease which is believed to be satisfactory, at least it outlines the conditions usually set forth in instruments of this kind, but these may be changed or modified to suit both parties to any proposed lease of mining property:

This indenture, made this day of, 190..., between The Mining Company, a corporation in the State of, doing business in the county of and State of, lessor, and, lessee or tenant:

Witnesseth, that the said company, the lessor as aforesaid, for and in consideration of the rents or royalties, covenants and agreements hereinafter mentioned, reserved and contained, and by said lessee stipulated and agreed to be paid, kept and performed, has granted, demised and let, and by these premises does grant, demise and let to the said lessee, upon leasehold only, for the purpose of mining in the manner hereinafter set forth, and not otherwise, to have and to hold unto the said lessee or tenant for the term of months, from the date hereof, expiring at noon on the day of, 190..., unless sooner forfeited or determined through the violation of any covenant hereinafter against the said tenant reserved: All the following described mining property, situated in the county of and State of, to wit:

That part of the lode beginning on the level at a point feet from the shaft; thence along the back of said level feet and in height feet, more or less, to the bottom of the next level above, being the foot level, and only upon the ore streak or seam upon which said levels are run, and not otherwise unless hereinafter in writing stipulated, together with the use, as may be necessary in working said premises, of said level and of shaft and tunnel, in common with said company and its other lessees, contractors and other employees, in such manner as may be hereinafter stipulated.

And in consideration of said demise or lease the lessee doth covenant and agree with said company or lessor that he, the said lessee, will truly do and perform all things required by the following stipulations hereof, subject only to the reservations hereinafter contained:

1. To enter upon said premises and to work the same mine-fashion in manner necessary to good and economical mining, so as to take out and save the greatest amount of ore possible, with due regard to safety of the premises and preservation of adjacent parts of the mine, and in accordance with the special covenants hereinafter reserved.

2. To work and mine said premises steadily and continuously from the date hereof, and to completely and fully stope and work out all merchantable ore from the ground therein before the expiration of the term of this lease, so that no part of the ground shall be buried or covered over.

3. To remove such earth and rock as is necessary as fast as it is broken; to do no underhand stoping; to well and sufficiently timber said premises to the satisfaction of the superintendent of said company, at all points where required by good mining, and to repair all old timbering if necessary.

4. All shafts or winzes, if any required, shall be 3½ feet by 6 feet in the clear, inside of timbering, and all drifts 6½ feet by 4 feet, and substantially timbered and secured in good and workmanlike manner, and all stopes to be secured in like manner by timbering or stalling over the drifts; and the level above said premises shall be secured against sinking into the stope by substantial timbering in such manner as shall be approved by the superintendent of the company.

5. Whenever the company shall, by its employees, contractors or lessees, work any other portion of the mine in such manner as to require the use of the level over which said demised premises are situated, lessee shall keep such level clear, so as not to interfere with such use.

6. All dumps formed in the working of this lease shall be the property of the company; shall be made where directed by the superintendent, and shall not be picked or worked for ore by the lessee.

7. The lessee shall, at all times during the term of this lease, hold and keep safe possession of said leased premises for and as lessee of said company, and will at no time permit the same to be unoccupied, and will permit no person not in his employ, or not having permission from said company, to have access thereto.

8. All work under this lease shall be subject to the

general direction and superintendence of said company, its superintendent and foreman, who shall at all times have full access to all the leased premises.

9. No person or persons shall be employed by or remain in the employ of the lessee whose employment shall at any time be objected to by the superintendent of said company.

10. All ore taken out of said premises by the lessee is and shall be the property of said company, unless otherwise ordered by the superintendent of said company, and shall be delivered by the lessee at such convenient place on the surface as the superintendent shall direct, and shall be properly dressed and sacked by the lessee, and the cost of hauling said ore, and weighing, crushing and assaying the same, shall be paid to said company by said lessee, it being understood that the lessee has full privilege of joining with the agent of the company in seeing to the proper weighing, sampling and assaying of all ore produced under this lease.

11. Said company shall retain as royalty or rental for said premises 60% of all the ore produced by the lessee therefrom, and shall pay to the lessee the value of the remainder of said ore, at the highest market price on the day when the ore is crushed and sampled, less reservations hereinafter stated; the ore retained as royalty and that purchased from lessee to be crushed and sampled together, and to be of the same assay value. The company may have the ore crushed and sampled at such mill as it may select, or may itself crush and sample the ore. The lessee may have control of assays made, and, upon failure of agreement upon assay and price, reference shall be had to arbitration by one or three disinterested persons, whose adjudication shall not be lower than the lowest assay or price, nor higher than the highest assay or price claimed, and shall be final.

12. The lessee and employee shall not set up or make any claim whatsoever to any lode, vein or deposit of ore discovered in the working of this lease, but shall and do hereby concede and quit-claim all title in such discoveries to said company.

13. The lessee shall not acquire any rights from location or construction of any tunnel driven to intersect the demised premises; but all such rights, if any accrue, shall inure to the benefit of said company.

14. All blacksmithing required by the lessee shall be done by the company, unless the superintendent shall otherwise direct, and the price to be paid to the company by the lessee therefor shall not be greater than that charged any other lessee of the company for like work.

15. The said company, when convenient, will furnish to the lessee all mine timbers, lagging, powder, fuse and candles used in working under this lease, for all of which the lessee shall pay to the company the usual price delivered at the mine in like quantities.

16. The company shall do all tramping at the expense of the lessee, unless the superintendent shall otherwise direct.

17. The company may reserve from payments made to lessee for ore 2% thereof until the expiration of this lease, as security that the entire amount of merchantable ore in said demised premises shall be fully stoped out as hereinbefore required, and as security that the covenants of this lease shall be fully performed; and the said lessee hereby especially agrees that if this lease shall be terminated by failure of performance of any of the covenants on his part herein made, or if all said merchantable ore shall not be stoped out before the end of the stated term of this lease, then the money so reserved may be retained in possession, and shall become the absolute property, of said company as liquidated damages for failure of covenants by said lessee. Reservation may also be made from payments to the lessee of all indebtedness due by him to the company.

18. Neither this lease, nor any interest in it, shall be transferable, and any assignment thereof, whether verbal or written, attempted to be made, shall operate as a cancellation of this lease. If said lessee shall at any time cease to personally work, or superintend the work, in said premises, it shall be construed as an abandonment or attempted transfer of the lease, and the company may take immediate possession and annul the lease.

19. It is mutually understood and agreed that said company shall in no event be held liable for damages or any indebtedness that may be incurred by said lessee in working this lease.

20. If said lessee shall hide or secrete or ship any ore in a fraudulent manner, then this lease to become void and of no effect.

21. The foregoing conditions and stipulations shall not be considered as changed or modified in any way except as hereinafter written.

And it is further stipulated and agreed that the superintendent of the said company is hereby constituted sole judge of the fulfillment of the covenants herein entered into by the lessee, and any failure of fulfillment and performance by the lessee of any such covenants or stipulations shall operate as a forfeiture and annulment of this lease, and the term thereof shall come to an end, and the company shall be entitled to immediate and exclusive possession of the leased premises; and at the end of the term of this lease, or upon forfeiture thereof by violation of its covenants, the said lessee agrees to surrender to said company, its agents, superintendent, successor

or assigns, the above demised premises, with the appurtenances and all improvements in good order and condition, with all shafts, tunnels, drifts and other passages thoroughly clear of rubbish, and drained, if necessary. Lessee further agrees and declares this to be his letter of attorney to the acting sheriff of the county, hereby fully authorizing and empowering him, at the request of the lessor, on the termination or forfeiture of this lease, or at any time thereafter, to enter into and take possession of all said leased premises, and the properties thereto belonging, and deliver the same to lessor without process of law, or upon termination of forfeiture as aforesaid, or at any time thereafter, the said company may, at its option, with or without force, with or without process of law, enter upon said premises and dispossess all persons occupying the same.

It is mutually understood and agreed that said company shall in no event be held liable, by virtue of any implied warranty of title or covenant in this lease contained, or otherwise, for quiet enjoyment of the said demised premises, or of the product thereof, in case the lessee should be evicted from the demised premises, or any part thereof, by any title paramount or otherwise, or in case any injunction be granted against either of the parties hereto, restraining them from working under this lease, or upon the demised premises or any part thereof.

In witness whereof the said company has, by its superintendent, hereunto set its hand and official seal, and the said lessee has hereunto set his hand and seal.

....., Lessor.
....., Lessee.

The Val Verde Smelter.

The smelting works of the Val Verde Copper Co., Ltd., are located on the high banks of the Agua Fria river, about 23 miles by railroad and 18 miles by wagon from Prescott, on the Prescott & Eastern Railroad, which is being built into the Bradshaw mountains, and in a short time will also connect with Lynx creek—through the Poland tunnel—an ore-producing section. The Val Verde Co. is at the foot of the valley, where smoke never is troublesome, as it invariably goes up or down the river. As the country is sparsely settled there is no likelihood of its becoming a nuisance. The smelter is about 75 feet above the river; they have an abundant slag dump and a supply of water in the Agua Fria river.

The company owns a large tract of land, which enables them to exclude saloons from their town. They have their own lodging houses, boarding house and commissary department, which make a village in themselves. The town is lit by electric lights, furnished by the company.

The illustration shows the Val Verde smelter, a portion of the town and also the Standard Smelting & Refining Co.'s mill to the left. It was taken a year ago, since which time the size of the smelter has been nearly doubled and a great many buildings added to the town.

The Val Verde Co. are using hot blast instead of cold blast for reduction of the ores, on account of the sulphur, arsenic, zinc and lead which most of their ores and concentrates contain, smelting which with cold blast being considered impracticable, for the reason that the large amount of coke required with cold blast reduces these objectionable elements into the matte, making it objectionable to the matte refiners. The Val Verde Copper Co. produces a clean copper matte, containing no arsenic nor antimony and only a very small percentage of lead and zinc, as by the use of hot blast, heated by the Bretherton hot blast stove, they make a high concentration without preliminary roasting, using about one-third the amount of coke which would be required with cold blast. The hot blast stove, which cost about \$3000, has enabled the company to dispense with a roasting plant, the cost of roasting, besides making a desirable matte and saving about \$80 a day in coke consumption, minus the daily operating expense of \$10 for wood burnt in the stove.

Val Verde, April 3.

Gold and Coal in Curry Co., Oregon.

The United States Geological Survey is about to issue the Port Orford (Oregon) Folio, No. 89, prepared by J. S. Diller, who surveyed the region several years ago.

The folio contains four maps, all representing the same region, but each showing special features. The first is a topographic map. The second, using the first as a base, shows the distribution of the various rock formations. The third calls special attention to those formations which are of economic importance; and the fourth illustrates by sections how these formations lie in the earth. These maps are accompanied by a text which describes the topography and geology of the region.

Port Orford is the only port in the quadrangle. The quadrangle contains about 870 square miles, and is inhabited by about 2000 people, engaged chiefly in agriculture, dairying, stock raising and mining.

The principal mineral resource is gold. Platinum and coal are found, but as yet cannot properly be counted among the resources. The coast has long

been noted for its beach mining, and there is yet considerable activity in a small way.

In the early days rich placers were found along Sixes river and Johnson creek. Search for the source of the gold has led to the discovery of numerous small pockets, especially about Rusty Butte and Poverty Gulch, but no working mines have yet been developed. There is clearly a mineralized belt running east and west near the streams named, and the source of the gold is to be found chiefly in the quartz veins and pockets of the region.

To Prevent Disease in Dynamos.

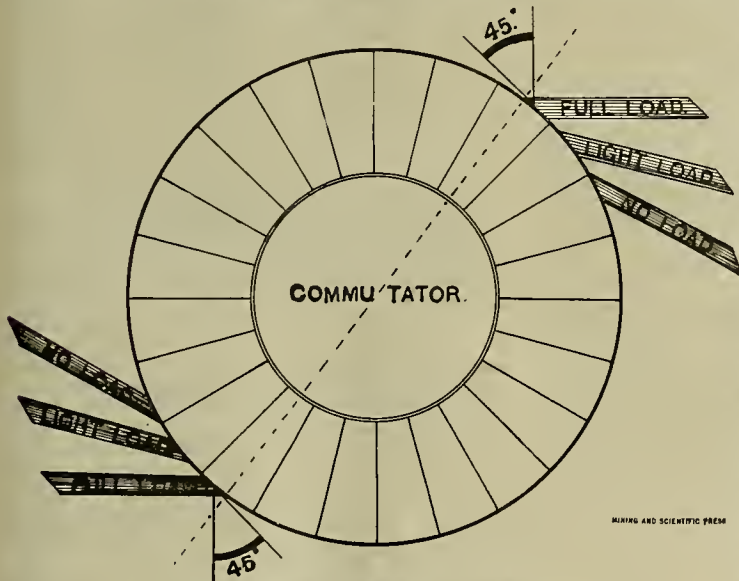

Written for the MINING AND SCIENTIFIC PRESS by
W. H. KRITZER, E. E.

It is assumed that the machine has been installed on an insulated, substantial and level foundation, free from vibration, and accessible on all sides in an airy, clean, cool, dry place, preferably of low temperature, and free from flying particles of any kind; also the attendant has some knowledge of the rudiments of electricity, and the principles involved in the different styles of dynamos.

Be sure when starting that the belt is tight, lubricators filled, all connections correct, the brushes properly trimmed and secured in their holders. After starting put down the brushes, close circuit switch and cut out rheostat resistance. When stopping, open circuit switch, cut in rheostat resistance, raise the brushes, then slow down.

Be sure that an excessive heating of the bearings is not caused by belt being stretched too tight, bent armature shaft, bearings out of line, journal boxes too tight, journals rough—due to improperly scraped boxes, oil of poor quality, overloaded dynamos.

To prevent sparking, be sure the brush holder tension springs allow a certain amount of movement and sufficient pressure to make a good contact; that the brushes are not spread apart and filled with oil or dirt, have no ragged edges or hard burnt ends, do not cut or scratch the commutator; and see

Proper Angle for Brushes on Dynamo.

that they are not overloaded beyond their capacity, that they extend from the brush holders equal length and are not set crooked but get full face of brush at the proper bevel; that the brushes rest against the commutator and the contact points are set diametrically opposite as well as in a neutral position (in bi-polar). In multi-polar machines these positions should be determined by the number of poles.

Be sure and never lift a brush while a dynamo is generating current, except when there are other brushes on the same stud, to remain in contact.

Be sure that the commutator is not dirty, oily, rough, worn on edges, or out of true circumference; that it is not overloaded, or has a high or low bar, or a high, hard mica between the segments.

Also that it has no section short circuited or a broken or loose connection between commutator and armature coils.

Be sure that an armature coil is not short circuited, has an open coil, or is grounded.

Be sure the field's coils are not weak and have no disconnections or short circuits.

Be sure there is no leak from the windings to the frames.

Be sure and keep the machine scrupulously clean in all parts at all times and never let a fault go without attention.

The illustration shows the angle to set brushes when carrying full load.

It is locally reported at Lead City, S. D., that the Homestake combination of mines has produced \$90,000,000 since 1877. There are 900 stamps in operation.

Milling at the Camp Bird, Colo.*

NUMBER II.

By THOMAS H. WOODS and GODFREY D. DOVETON.

The discharge area of the screens is 50 inches by 8 inches. The stamp duty is at present 3.11 tons (dry ore) per stamp per day. Sectional guides are in use on forty head of stamps. This type of guide was designed by W. MacDonough, superintendent of construction. It will be seen that this is a quick guide in turning stems, and is very firm and rigid in construction. As may be seen in the drawing, specially

The MacDonough Stamp-Guide.

cast washers (d d) are used, instead of the ordinary round washers, for the purpose of more securely holding the guide over its full width. The $\frac{1}{2}$ -inch bolts (c c) are put in crosswise, in order to prevent the splitting of the guides. On twenty of the stamps the Fargo guide is in use.

The water (twenty gallons per minute) is supplied to the mortar through the feed slot with $\frac{1}{2}$ -inch pipe. This method of feeding the water insures a thorough mixing of the ore. For some unaccountable reason fewer stems have been broken since the back feeding has been adopted. When front feed was in use here (the water being supplied through five small pipes) frequent annoyance was experienced through the tendency of the pipes to jar loose and leak. They were also much in the way when repair work was in progress.

AMALGAMATING PRACTICE.—The plates are 16 feet long, 53 inches wide, of raw annealed copper, $\frac{1}{8}$ inch thick, and have a fall of $\frac{1}{8}$ inch per foot. They are delivered to the mill in 4-foot sections. The method of preparing the plate for service is as follows: The surface is scoured thoroughly by vigorous

rubbing with tailings or a piece of brick, to remove all traces of oxide and expose the bright surface of the metal. Strips of blanketing are placed on the table along the sides and across the line of junction, and the sections of copper securely screwed to the table with brass screws counter sunk. Iron screws rust so rapidly that they are of little use for this purpose. The plate is now thoroughly washed with hot water, and again with a strong solution of lye. The quicksilver is applied a little at a time, and the plate thoroughly amalgamated by vigorous rubbing with a blanket brush. A little dilute cyanide is used during this operation. A new plate, during the first few days it is in service, is dressed usually every two hours, and little or no amalgam is removed, except, perhaps, from the head, until a coating has accumulated.

CLEAN-UP AND DRESSING.—The methods pursued in the daily clean-up of the mill are as follows: The battery being hung up, the plate is carefully washed, the amalgam at the head (sometimes hard and crystalline, due, in the writer's opinion, to the manganese present in the ore) is slightly softened by sprinkling with a small quantity of quicksilver and rubbing with scrubbing brushes, after which the amalgam, commencing at the bottom and working upwards, is removed by means of rubber scrapers. Knives are seldom used, except possibly at the very head. After the amalgam is removed the plates are again sprinkled with mercury, which is thoroughly spread and worked into the copper. Following this operation the plates are brushed with very fine whitewash brushes, and riffled crosswise. During this latter operation the mercury is slightly drawn

to the sides of the plate, consequently the brushes are drawn lengthwise along the sides, from the bottom to the top. This finished, the feed water is turned on and the stamps again dropped. The time of cleaning up and dressing is about twenty minutes to each plate. The plates are cleaned the full length at the morning clean-up, while in the evening the top only is cleaned, unless the ore is unusually rich.

The plates are dressed every three hours, and no mercury is fed into the mortar. Weak solutions of lye and potassium cyanide are employed while dressing, and lime is occasionally supplied to the batteries to neutralize the acidity of the feed water and the ore. No difficulty is experienced in keeping the plates free from verdigris by these methods. An average extraction of 75% is obtained at this stage of the milling, with a resulting loss of .142 to .166 ounce quicksilver per ton.

The amalgam recovered in the mill is immediately conveyed to the amalgam room, and there cleaned and retorted. The impurities which adhere to the plates are very tenacious, and on this account it is necessary to grind the crude amalgam in mortars, for the purpose of mechanically separating the sulphurets and sand. The clean-ups are submitted to two separate grindings. In the first, after softening with additional mercury and grinding for a time in hot water, the hatch breaks, and the partially clean amalgam sinks to the bottom, while most of the impurities float on the top and are skimmed off. The amalgam remaining is then squeezed through canvas bags and freed from excess of mercury. It is then further cleaned by a second grinding, so that very few impurities remain. After being subjected to a further squeezing, the amalgam is retorted. The yield is about 40%, and the fineness of the gold thus recovered is .740.

The sulphurets and other impurities in the ore have a tendency to foul the mercury, and it is therefore necessary to retort all of it before using it again in the mill. The gold is weighed and shipped daily to the mint.

The pulp from each ten stamps, after leaving the plates, is run to traps—simple wooden boxes, 12 by 15 by 8 inches—suspended on iron hangers, with a motion given them similar to that of a vanner. They make 180 strokes, of $\frac{1}{2}$ -inch throw, per minute. On the discharge side they are fitted with long copper lips connected with the vanner launder. The pulp is delivered to the center of the trap, and this and the reciprocating motion of the box prevents the settling and packing of the sands and concentrates, allowing ample opportunity for the amalgam and mercury, which escapes from the plates, to deposit.

The traps have proved very efficient, and at no time has the presence of mercury been detected in the cyanide solutions. Once a week the traps are cleaned and 50 ounces of mercury distributed among the six.

The pulp, on leaving the plates and passing through the traps, is delivered to thirty-six concentrators. Sizing is carried on in pointed boxes, the pulp from each 20 stamps running to six machines; and, as double concentration is in vogue, it is elevated and treated again on a second row of vanners.

The final tailings are delivered to the cyanide works.

CONCENTRATION.—The concentrator equipment consists of thirty 6-foot Frue vanners, and six Wilfley tables. The first row of vanners is fitted with amalgam savers in the form of copper plates fitted to the pulp distributors. The vanners are set up and anchored to massive sills which run the entire length of the building.

Too much care cannot be given to the erection of the concentrators, if good results are to be obtained, the least lost motion in the machine being very noticeable in the results, both at the front and back end of the table. The machines on the coarse side run 190 revolutions per minute, and are given an inclination of $3\frac{1}{2}$ inches in their entire length. On the slime side a speed of 182 revolutions is allowed with an inclination of $2\frac{1}{2}$ inches. The speed and inclination are based upon careful experiments. Corrugated belts are in use on the head machines in the front row. They give very good satisfaction in handling the coarsest of the pulp and have a much greater capacity, although the tailings have a slightly higher value and the resulting concentrates are not quite so clean. However, in view of the second concentration, they are to be recommended.

All these vanners are equipped with sulphuret rollers, and the mud boxes of each machine are connected with settling tanks. Little trouble is experienced from the belt elevators, which travel at a speed of 410 feet per minute, lifting 15 feet. The pulleys are key-seated and set-screwed, and an 8-ply belt is used, having a life of fourteen months.

Lines of track are run in front of each row of vanners, to facilitate handling the sulphurets, which are trammed direct to the dryer building. The dryer

*Trans. Am. Inst. Min. Engs. (condensed).

proper consists of iron-lined shoots or bins, set at an angle of 45°. They are 4 feet wide and are fitted at the bottom with iron gates, for withdrawing the dried concentrates. In the center of each bin are coils of pipe heated with exhaust steam from the mill engine. The concentrates remain in the dryer some three or four days, and by that time the moisture is reduced to about 3%.

Concentration is carried on at a ratio of about 15 to 1, and the average extraction in the concentrating department is about 10% of the whole, giving an average total saving, in the stamp mill alone, of 85%.

The average analysis of the concentrates during an extended period has been:

	Per Cent.
Silica.....	18.00
Galena.....	7.04
Copper pyrite.....	8.20
Iron pyrite.....	30.15
Magnetite.....	7.00
Blende.....	16.50
Rhodinite.....	4.80
Calcite.....	9.00

Total100.69

The analyses of the ore from which these concentrates were produced:

	Per Cent.
Silica and insolubles.....	85.20
Galena.....	.50
Copper pyrite.....	.80
Iron pyrite.....	6.50
Magnetite.....	.50
Blende.....	3.00
Rhodinite.....	2.50
Alumina.....	1.50

Total100.50

The above analyses were made for the writers by W. F. Harris.

The cost of milling the ore in summer is from 48 to 54 cents per ton; in winter, 68 to 72 cents per ton.

POWER.—The boiler equipment consists of a battery of three 150 H. P. water-tube boilers, supplying steam to a 250 H. P. tandem compound Corliss engine. To this the main stamp-mill line shaft is direct connected. By means of a counter shaft, a 100 H. P. Westinghouse generator is connected, which, in turn, furnishes power to the cyanide mill, machine and carpenter shops. The Telluride Power Transmission Co. has erected a station for reserve electrical power, and from it power can be obtained in case of emergency.

In summer a 7-foot Pelton water wheel, working under 175 pounds pressure, supplants the steam equipment. During the latter part of the winter, when the water supply is decreased, owing to natural conditions, a dam is used for settling the water. The slimes accumulated by this dam are treated during the summer months by cyaniding.

The mills, shops, boarding houses and offices are lighted by electricity. The exhaust steam from the engine, which has never over 1½ pound back pressure is utilized for heating the mills by a system of radiators, as well as for running the dryer, the water of condensation being returned, by means of pumps to the boilers.

A common storehouse, both for the mine and mill, forms part of the plant equipment, supplies being charged separately to the various operations.

COST OF MILLING PER TON OF ORE.

Crushing or breaking	Labor.....	\$0.065
	Repairs and maintenance.	0.006
	Labor.....	0.059
	Wear of iron.....	0.048
Pulverizing.....	Screens.....	0.009

	Fuel.....	0.160
	Lubricants and sundries..	0.006
Superintendence day and night.....		0.075

Total milling expenses.....\$0.707

In these costs the separate treatment of the concentrates, per ton of ore milled, is not included.

CYANIDE WORKS AND TREATMENT OF TAILINGS.—The cyanide works are arranged for the direct treatment of the vanner tailings. They have a capacity of about 200 tons per day, but at the present time treat 150 tons daily. Owing to the position of the mill, the tailings have to be elevated a height of 40 feet, and this is accomplished by a No. 4 centrifugal sand pump, running at 650 revolutions. The column pipe is 4 inches in diameter, and 315 gallons of pulp are delivered to the settling vats per minute. The linings of the pump are of manganese steel, and undergo erosion quickly, so that the life of a lining averages six, and under favorable circumstances, eight to ten weeks. A duplicate pump is kept in reserve, ready for immediate use. When worn out, the pump is removed to the machine shop, re-lined and new collars, if necessary, are fitted on the shaft.

(TO BE CONTINUED.)

Use of Crude Oil in a Gas Engine.

Replying to an inquiry as to their experience in the use of Coalinga oil (34° gravity) in gas engines in place of using gasoline, John Rosenfeld's Sons say: "We have not only found that we can run on Coalinga oil at one-fifth the cost of gasoline (72° gravity), but that we can produce power at less cost with Coalinga oil in gas engines than can be done with the cheapest available fuel in the ordinary types of steam engines. We give you the following from our experience at the Vandalia mine, El Dorado county, Cal.:

"When we bought the property they were using gasoline in small gas engines and we continued their use for a short time, gasoline costing from 16 to 18 cents per gallon plus freight from San Francisco or Sacramento, Cal., to the mine.

"In contemplating the enlargement of the plant we had figured on water, electric or steam power. As at first we wanted only 75 to 100 H. P., we were on the point of buying a steam plant, when we heard of a pumping plant that had been using Coalinga crude oil in a gas engine, with a Daniel Best generator attached. We were astonished at the way it figured out, as it seemed cheaper to generate power with the Coalinga oil in a gas engine than with the heavy oils used on boilers, even though the price of Coalinga oil was much higher than the heavy Bakersfield oil; and as against gasoline it seemed to cost less than one-fifth.

"We concluded to hold the steam plant in abeyance until we could test the Coalinga oil to our own satisfaction. We ordered a Best generator (at a very small cost) and attached it to a 10 H. P. Hercules gas engine which we had at the mine, and had them alternately using Coalinga oil and gasoline. We found that we consumed less Coalinga oil than we did 72° gasoline doing the same work.

"As the gasoline cost us five times as much as the Coalinga oil we readily saw that we could no longer afford to use gasoline or distillate.

"At the same time it figured a less cost per horse power on even a 10 H. P. gas engine than we knew the lowest cost to be on a 5000 H. P. highest class steam engine and boiler plant using fuel oil for generating steam. Also, we found the residue from the Coalinga oil a fine lubricant that we could use in place of oil that would cost us 25 cents per gallon; and we had applications from others to buy this residue if we made more than we could use. Upon this showing we concluded to use gas engines and Coalinga oil and we installed a 75 H. P. gas engine and generator, which we have now been running some time very successfully.

"Our mine is on a branch road charging a high rate of freight in addition to the San Francisco terminal rate, and yet we find it costs us less than \$2 per horse power per month of 720 hours for fuel.

"We asked the mine to furnish us accurate data of the consumption of Coalinga oil in the 75 H. P. engine, and received the following: 'The past ten days, when running twenty out of twenty-four hours we have developed 60 H. P. (and at times over) on seven gallons per hour, or .1166 of a gallon per horse power per hour. We also saved 150 gallons of residue, which replaces an equal number of gallons of lubricating oil costing 25 cents per gallon, and which should therefore be credited against the cost of the Coalinga oil.'

"It is our experience that one gallon of Coalinga oil will produce as much power as one and one-half gallons of gasoline.

"From the figures of consumption given above you can arrive at the comparative cost of running gas engines, taking the prices of Coalinga oil and of gasoline at the place where it would be used.

"As some parties are now figuring on a 1000 H. P. plant, and as it appears they could run at lower cost on Coalinga oil with gas engines than with steam engines, we have promised to make some exhaustive tests for them. We feel satisfied, however, they will show fully as well, as we have found the results the same on both the 10 and 75 H. P. engines. We can switch over to gasoline any time, so that the comparison at least is easily demonstrated. In fact our men running the engines say they can notice the stronger effect of Coalinga oil immediately they switch on to it."

The Pinder Concentrator.

In the Pinder concentrating table, illustrated here-with, the form of the table is that of a pan or batea shaped as an involute with its plain surface sloping

The Pinder Concentrator.

to the center, where all the tailings are discharged through a suitable spout. This part of the table top is flexible. Turning the hand wheel, shown in the center, automatically adjusts the slope of the surface of the table, and is thus intended to suit varying conditions in actual practice. The tapering riffles are made of special rubber composition; the dimensions may be varied to suit different conditions. They are tacked and cemented on this surface in a spiral form, the feather ends terminating in a circle near the outer edge of the table.

The pulp is fed upon the table through a series of holes in the outer side of the circular pulp box, which is 8 feet in length, near the heavy end or head of the riffles. It flows down and around the adjustably inclined surface, across the forty-six riffles, towards the center discharge. The table is ball bearing, the movement imparting a quick motion at the outer end of its stroke and a much slower motion at the inner end. This stroke may be shortened or lengthened to suit the requirements of the different ores. The pulp is kept in motion under a thin, evenly distributed flow of wash water issuing from the openings in the pipe suspended over and around the outer edge of the table. The mass moves down the circular incline; the riffles catch the ore particles and conduct them to a point where several fingers are arranged to separate the concentrates into different grades.

The pulp, or concentrates, travel 26 feet along and around the cleaning surface of the table.

The capacity of the table is rated at fifteen to thirty tons, or five to ten stamps; horse power required, ½; floor space, 8½x11½ feet; shipping weight, 2800 pounds, boxed. It is manufactured by the Joshua Hendy Machine Works, San Francisco, Cal.

Test for Precious Metals in Cyanide Solutions.*

By ALBERT ARENTS, Alameda, California.

This test is based upon the fact that metallic copper will precipitate gold and silver upon its surface from acid solutions. Of course, the fact is not new, but its application is probably so. I have used the method with success; it recommends itself by the rapidity and ease with which it may be carried on.

An auriferous cyanide solution, if made acid with sulphuric acid and boiled with finely divided, pulverulent, metallic copper, will, within a short time, deposit its gold content on the copper. Any silver in the solution is also precipitated. If this mixture is now filtered, the filter and contents may at once be subjected to a crucible assay treatment, and its lead buttons cupelled and determined.

If, instead of taking cement copper, or any metallic copper powder, a solution of bluestone is used after acidification, and a few small pieces of sheet aluminum are added, and the solution boiled until all the copper has come down, the result as to the precipitation of gold and silver is the same. This modification takes more time and attention in boiling. If aluminum has been used, it should go into the crucible with the filter and its contents. Commercial cement copper is particularly fitted for this test, because the acid, in taking up any basic iron or copper salts of the cement copper, renders the copper as finely divided as it is customary to obtain it in the sluice boxes of "copper leachers." The finer and the more pulverulent the copper is, the greater is its surface and the more energetic the precipitation, thus permitting a minimum amount of copper to be used.

In applying the method, I use, as a rule, 250 c.c. of the solution to be tested; add a few c.c. of sulphuric acid; agitate for several seconds, then add not less (although not much more) than one grain of cement copper. Now follows heating to boiling. This is kept up for about ten minutes, so that the rising steam bubbles keep the mixture well agitated. The mixture is then filtered through a 7-inch diameter gray filter paper. No washing is done. As soon as the filtering is finished, one-third of a crucible charge of flux is added to the filter containing all the sediment of the mixture. Some of the moisture is rapidly absorbed by the flux, which permits the folding of the filter's rim upon the charge and its subsequent removal without loss or tearing. One-third of a crucible charge of flux having previously been placed upon the bottom of the crucible which is to be used for melting, the filter is transferred to the crucible, well tucked down, and the last one-third of the crucible charge is placed on top of the filter in the crucible. It is then ready for the furnace. The filter itself furnishes the reducing agent for the assay. I use thirty grams litharge and the usual amount of borax and soda, employing a No. F crucible for melting. About twenty grams of lead are obtained. The lead button comes out bright and clean, and upon cupelling furnishes a bead free from copper.

Possibly this method of testing for gold and silver may be used upon other solutions than cyanide; also, for solutions from testing metallic copper for precious metals, when the solutions do not contain nitric acid in any form.

*Trans. Am. Inst. Min. Engs.

Examples of Mine Timbering.*

Written by W. H. VALE.

So many emergencies that crop up in mining necessitate a departure from ordinary methods that the writer has been led to illustrate a few of the examples that have come under his notice during a somewhat lengthy career; and as most of the methods illustrated are certainly outside the ordinary, it may be hoped that while to many they may convey little that is new, to the larger number some acceptable information may be gleaned whenever the occasion calls for it.

Experience has shown that there can be no hard and fast rule in mine timbering that will fit the varying necessities of different localities, and the engineer must divest his mind of all prejudices that his practice of any particular system or systems may have induced, and must direct his attention to the character of the local timber and its fitness or otherwise for the purpose he has in view. Fortunate indeed are the man and mine that can claim an abundance of good and cheap mining timber; it simplifies, oftentimes, what would be, under unfavorable timber conditions, a difficult problem. In many parts of the State there is either none or at best a scrub; if the latter, he has to either pigstye, balk, or bulkhead, if his ground will permit; if not, and the necessary timber has to be imported, then some system of recovering his timber and using it over and over again may be possible.

As an illustration of this, Figs. 1 and 2 show a method applied to the copper deposits of the Lyell

Longitudinal Section Fig. 1.

Transverse Section Fig. 2.

Tharsis, Tasmania. The workings were wide, varying from 30 feet to 50 feet, and the deposit a talcose schist of fairly good standing character. Some occasional styes were used, but the main bulk of the ground was taken up by the timber shown. It will be seen in the transverse section that the vertical timber A has a tenon on both ends and a corresponding mortise in the cap and sill, the latter set on a number of round or rough split pieces, about 4 feet long and bedded on the filling. The leg is then stepped into the sill, the cap adjusted on the leg, and the whole reared up under the ground, which should not reach to within say 4 inches to 8 inches of the back. There is absolutely no necessity to trim the ground, split pieces filling the inequalities and assisting to keep the timber against the shots. The wedges are then driven firmly wherever possible, until the leg rings solid when struck with the hammer.

A stope is shown in the longitudinal section with the mullock filling brought forward until the center leg A is nearly buried. It can then be drawn with the loss of the bottom sill and the rough flooring below.

It will be seen that to apply this method the ground must have some standing character, good enough for 8 or 10 feet at the least, while the filling must be kept up as the work progresses. Under favorable conditions its economy is beyond question, and in many instances that have come under my notice its application would have been satisfactory where the very much more costly system of square setting has been employed.

Figs. 3 and 4 exhibit plan and transverse section of a method employed by the Harrietville gold mines, Victoria. The lode had an underlie to the east of about 60°, varied from 10 feet to 23 feet wide, and was an exceedingly hard quartzite, requiring a large amount of explosives, flying, when broken, with great force. The foot wall was a dense sandstone, the hanging wall totally different—slate, alternating in bars from 10 feet to 12 feet wide. The slate was very treacherous where it came into contact with

the lode channel. A glance at the section will show that the main difficulty occurred in taking out the last stope approaching the level. It left a great

Plan Fig. 3.

stretch of wall that had to be maintained at any cost—level G, stull timber H, filling overhead I, last stope in lode J, previous stope K, with stulling piece and filling below.

Timber was plentiful and good, consequently cheap, so that it became more a question of keeping the wall against the violence of the explosive than the timber cost, hence the plan adopted. Fifteen-inch to 18-inch timber was split in two to form the strap L, the flat side against the hanging wall, and stepped on to

Transverse Section. Fig. 4.

the stull piece below. The headboard of the stull and a lath towards the top of the strap kept the latter sufficiently away from the wall to allow starting the laths. The strap was then temporarily tommed, flat pieces dressed off at the points where the horizontal pieces M would sit, and a mortise cut from nothing at the head to 2½ inches deep at the bottom of the piece when driven home. A tenon was then cut on the piece by allowing the difference between the square of the stick and the level required, as shown in the dotted lines at the head of each piece. The center stull was left out as long as possible, the upper and lower ones driven at once and lagged up permanently (see plan). Once in position, they could only be shifted by smashing them, and this was avoided by employing careful, competent men.

Transverse Section. Fig. 5.

Fig. 5 shows a system of cross-timbering immediately below a faulting, in the same mine. Although no actual dislocation of the lode took place, it was contorted out of position and pinched at the fault to

such an extent as to make two hanging walls, as shown in the section. The country, although similar to that previously described, was, with the lode, very much softer, and at the same time much broken. The main feature lies in footing the stulls on the headboards, as shown, instead of on the pieces themselves. The method is one that is not often required, and men are apt to get hazy over what is called cross-timbering, and are, in consequence, likely to make a mess of it.

Elevation. Fig. 6.

Plan Fig. 7.

Longitudinal Section Fig. 8.

Figs. 6, 7 and 8 represent what is called a horn set, a form of timbering that can be applied in several ways, and takes its name from the fourth of the leg (see plan, Fig. 7) being carried through the cap and either set onto a headboard (as shown in both section and elevation, Figs. 6 and 8) or cut off flush with the back of the cap piece and utilized as an ordinary set against blasting. As shown in the section, it is being used in a very low underlay shaft, instances of which occur from time to time, and which necessitate some form of timbering sufficiently rigid to withstand blasting with the sets close into the face. The lagging are protected from the shots by the cap piece, which in its turn is kept in position by the lagging, the whole, with the assistance of the horn, making a perfectly rigid set and one that will stand all the stress the timber is capable of.

Front Elevation. Fig. 9.

Transverse Section Fig. 10.

Figs. 9 and 10 exhibit an easily and quickly made ore or mullock pass. Very little explanation is required, as the drawings in both elevation and section

Longitudinal Section Fig. 11
Underground Chamber, United Bros
Mount Wills.

are to scale. The only piece that is "let in" is the 4x4-inch, diagonally into the front hangers and bolted. This forms the lip of the pass and carries the floor;

*Trans. Australian Inst. Min. Engs. (condensed)

the rest of the sawn timber is simply hung on bolts. The frame is generally made on the surface, taken down again, and again put together underground.

Fig. 11 shows a system of timbering an underground chamber used in the United Brothers' gold mine, Mount Wills, Victoria. It will be observed that the collar set over the shaft has been extended the full width of the chamber and the studs, which are from 12-inch to 15-inch round timber, are mortised into the set. Sawn timber, 12x6-inch, was used to carry the centering and form the skeleton shaft, and the only bolts used in the whole structure were employed drawing the 12x6-inch stuff up the centers so as to prevent warping.

Mining and Metallurgical Patents.

PATENTS ISSUED APRIL 7, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

FURNACE FEEDING APPARATUS.—No. 724,376; C. W. Bray, Pittsburg, Pa.

Heating chambers having series feed openings, series stationary feeding devices for moving plates therein, and starting connections for feed devices extending to common point.

ELECTROSTATIC SEPARATOR.—No. 724,679; C. E. Dolbear, Boston, Mass.

In ore separating apparatus, combination of source of high potential electricity, pair similarly charged plates connected therewith between which ore is caused to pass, third oppositely charged plate located between first two, and means for collecting separately separated materials.

NOZZLE FOR FLUIDS.—No. 724,678; W. A. Dohle, San Francisco, Cal.

In discharging nozzle, adjustable core piece for regulating amount discharge, means for counterbalancing pressure on core piece, means for removing core piece, and means, as springs, for affording variable reinforcement to core piece, as counterbalancing

force is disturbed by the opening of variable area of discharge.

DREDGING MACHINE.—No. 724,703; J. W. Humphreys, Iroquois, Ill.

Machine having swinging frame carrying endless belt of scoops, means arranged on frame for actuating scoops, means for removing earth and delivering it to scoops, and means for vertically adjusting swinging frames comprising standard or har yoked up with frames.

ORE SEPARATOR.—No. 724,705; H. G. Johnson and M. S. Howard, Waukon, Iowa.

Ore roasting mechanism comprising base member; supporting trunnions carried by base; conical exterior casing having annular track rails at each end adapted to rest upon trunnions; feed mechanism adapted to deliver ore into one end of outer casing; longitudinally disposed flanges carried by exterior casing adapted to agitate ore therein; interior chamber and pockets carried at one end of exterior chamber whereby ore is delivered from exterior into interior chamber.

ORE ROASTING FURNACE.—No. 724,942; G. F. Rendall, New York, N. Y.

In ore roasting furnace, hopper, retort, conveyor suitably mounted therein, means for conducting ores from hopper to retort, means for rotating conveyor, second retort situated adjacent first mentioned retort, casings around retorts, roller hearings in casings for shafts of conveyors, conveyor within second

retort, means for rotating conveyor in opposite direction in line of travel of conveyor in first mentioned retort, third retort communicating with second retort at end opposite communication with first retort, conveyor in last mentioned retort having shaft mounted on roller bearings, means for driving conveyor in direction opposite to line of travel of conveyor in second mentioned retort, passages forming communication between interior of retorts at alternately opposite ends, pipe leading downwardly from uppermost retort near its mid-length, steam blast located to discharge directly into vertical portion of pipe, nozzle on end of steam blast pipe within pipe leading from uppermost retort.

ELECTRICAL SMELTING APPARATUS.—No. 724,778; R. L. Barnhart, Charleroi, Pa.

Combination of two oppositely situated orificed heads adapted to be charged with electricity and insulated from each other, means for forcing plastic minerals through orificed heads, forming meeting rods or bars of mineral, and insulating box lying between heads and covering adjacent ends of heads.

SELF-CONTAINED BACK-GEARED HEADSTALL FOR ELEVATOR BUCKET DREDGES.—No. 724,868; G. L. Holmes, Chicago, Ill.

In self-contained back-geared headstall for elevator bucket dredges, combination of high speed driving shaft with low speed driven shaft or quill concentric therewith, gears and pinions connecting one with the other and reducing speed, dredge chain and buckets driven by such driven shaft, and two outer frame pieces in which driving shaft is journaled and two inner frame pieces in which driven shaft is journaled.

QUICKSILVER ROASTER.—No. 724,581; A. Johnson, San Luis Obispo, and R. McKay, San Francisco, Cal.

A device consisting of bench of pipes arranged with doors one extremity, outlets at opposite extremities of pipes, fireplace, winding flue beneath pipes and leading from fireplace, and plurality of arched flues passing over pipes and from winding flues.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The Alaska G. M. & Guaranty Co. is incorporated to construct a smelter at Skagway; W. F. Matlock of Pendleton, Or., W. W. Broughton, C. L. Andrews, J. G. Price, P. E. Kern of Skagway, B. K. Hall is manager. The location is convenient to the quartz camps of Treadwell, Sheep Creek, Whitehorse, Atlin, Silverbow Basin and Sundum and the copper deposits of Rainy Hollow, says the Alaskan.

F. Glengrass, who has a lease of the Wyman property in Copper Mountain district, near Ketchikan, has put in a hoisting plant, and expects to make shipments at the rate of 300 tons per month. The ore will net him \$20 per ton, says the Ketchikan Journal.

The El Capitan M. Co. of Seattle, Wash., owning 960 acres of marble lands on the west coast of Prince of Wales island, will put in channeling machines, drills, saws, derricks and a power plant this spring and quarry out the stone, which is a good quality of white marble, says Manager R. M. Palmer.

Manager W. B. Hoggatt of the Jualin mine at Berner's Bay, on Lynn canal, below Skagway, says machinery will be put in and development work increased this summer.

ARIZONA.

COCHISE COUNTY.

The Calumet & Arizona reports the March production to be 1,307,000 pounds of refined copper.

The Middlemarch M. Co., near Tombstone, will put in a concentrating plant, says Superintendent O'Gorman.

President C. Briggs of the Calumet & Pittsburgh Co., operating near Bisbee, in his annual report says that during the fiscal year ending March 1 a double-drum hoist, a boiler plant, compressor, station pump, buildings, etc., were erected. Exploration work was confined to sinking and cutting stations. The main shaft has been sunk 925 feet, at which point water was struck.

H. Pyeatt and A. Kelly have men at work on the Ozella mine in Lyall canyon, Huachuca mountains, near Bisbee. They report opening up ore carrying gold and copper.

GILA COUNTY.

(Special Correspondence).—The Old Dominion C. M. & S. Co. of Globe are putting in a new smelting plant consisting of three blast furnaces, each 44x180 inches; two converters, 6x10 feet. The buildings will be built of steel. They will use electric crane and electric haulage for the slag pots and charge barrows and will also erect a 250-ton concentrating mill and briquetting plant. They have one briquetting machine on hand and will install two others. Ore will be delivered from mine to smelter by steam locomotive and steel ore cars. The new shaft on the mine will be equipped with steel head frame. They intend to build bins for custom ores. F. W. Hoar is superintendent.

Globe, April 10.

The Black Warrior Co., near Globe, will resume next week, and expect to have the leaching plant in operation by May 1.

A. Walsh has bought the D. R. Williamson one-fifth interest in the McNelly & Crowley group of copper claims on Pinto creek, near Globe, for \$5000.

MOHAVE COUNTY.

(Special Correspondence).—At Chloride, work on the Minnesota mine has been resumed. The 225-ton mill is running on the dump estimated to contain 200,000 tons.

The mill at the Elkhart is running only part time for lack of ore. The mine is working twenty-five men. The principal work is on the 500 level.

The Tennessee mine and mill have resumed work with a full crew. They have been closed down for several weeks owing to a pinching out of ore on the 500 level. It is reported that the 500-foot shaft will be sunk to 1000 feet.

The Midnight mine, belonging to St. Charles Bros. & Babcock of Kingman and Chloride, has been examined recently for a Baker City, Or., mining company. The Midnight has a large tonnage of low grade ore carrying gold, silver and copper, and has 1000 feet of sinking and drifting done.

At Union Pass, the Richardson Bros., superintending and operating the group of gold mines owned by the Portales de Oro M. Co., have a 10-foot vein that averages \$19 per ton.

The Standard M. Co., in the Chichueris mountains, have their main shaft down 75 feet on a small vein of fine milling gold ore.

A 4-foot vein of 10% copper ore has recently been opened on the Paymaster mine at Mineral Park. The ores also carry gold and silver.

At Cerbat new gold discoveries have been made lately. L. Dixon has a vein that goes eight ounces gold to the ton.

A good body of ore is reported in the Climax, owned by J. Dundon, which carries gold and copper.

The Nevada mine has completed 100 feet of drift on the 200 level, and Manager E. F. Holiday has let another contract for sinking a 75-foot shaft on the Tom mine, an extension of the Nevada. These and other properties at Cerbat belong to Redlands, Cal., men.

The Gem mine, owned by T. L. Ayers of San Francisco, Cal., under lease and bond and being worked by H. McKay, is to be taken over by him. He will put in a concentrating plant.

Chloride, April 13.

An additional set of rolls, weighing twenty-five tons, is being set up in the Gold Roads mill, near Kingman.

Work will be resumed on the Homestake group of mines, near Silver Creek, by the Gold Roads Co., owned by R. J. Holmes. C. A. Stevens is superintendent of the company.

At the C. O. D. mine, near Kingman, the drift west on the 300-foot level is in 900 feet. When 1000 feet is reached an upraise will be made to the surface, which will be used as the main working shaft. When this shaft is finished additional men will be put on and stopes opened up. A 100-ton reduction plant will be installed near the new shaft. The ore shoot shows up the full length of the drift and carries values in gold and silver.

PINAL COUNTY.

Near Kelvin, the Troy mine management are reported surveying for a narrow gauge railroad from the mines to a point on the Gila river, where it is intended to erect a smelter. As soon as the P. & E. road is completed to Kelvin, the Ray mine will resume. The oil well near Kelvin is down 1100 feet and sinking at the rate of 5 feet per day; it has passed through a little oil and some gas.

G. Hamlin, superintendent of the Relief gold mine, 22 miles northwest of Phoenix, says a cyanide plant will be erected capable of reducing at least fifty tons of ore per day.

Manager G. W. Hull has men at work in ore in the Dillon and Winningham tunnels on the Cleopatra group, near Jerome, says the News. He will drift on the ore in the Winningham tunnel and sink from it to the Dillon tunnel. A body of ore has been cut near the face of the Dillon tunnel, on the property of the King Development Co.

Superintendent M. Bradley of the Lion G. M. Co. on Cherry creek, near Prescott, has the mill in operation on ore from the Lion mine. Drifting is being pushed from the 450-foot level on an 8-foot vein of milling ore. Bradley has bought the Buffalo quartz claim, adjoining, on which he is driving a tunnel in the ledge, which will open up the ledge to a depth of 350 feet. The ore runs \$40 per ton in gold.

Manager R. De Large has begun the erection of a 10-stamp mill for the Brooklyn Co. on their Cherry creek group, near Prescott.

The capacity of the United Verde smelter at Jerome was increased by blowing in last week one of the larger furnaces recently constructed. Hoisting ore has begun by way of the new hoist.

C. G. Fennell has a lease on the Gladstone mine, near McCabe, and started work this week.

Work has been resumed on the Gold Dust mine of the Hudson group, on Lynx creek, near Prescott. This vein is 3 feet wide, principally gray copper averaging 15%, with gold values of \$15 per ton. The Alice mine of this group shows 5 feet of free-milling gold ore averaging \$20 per ton. Shafts have been sunk, showing the vein at several points.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The miners' strike is on, and extends from the Central Eureka on the north to the Gwin mine in Calaveras county on the south. About 1000 men are idle. The demands of the miners were made on Monday, the 13th inst., and were in effect that the Union be recognized; that men who have been discharged because of affiliation with the Unions be reinstated; that no miner be discharged without submitting the matter to a committee of the Federation; that working hours be shortened from ten to eight hours; and that there be no decrease in the pay on account of shorter hours. These demands were ignored. On this, Wednesday, morning the engineers and skip men were called out at the Kennedy mine, and that mine is tied up completely. In some of the mines a few are

working, but it is expected all will quit within a day or two. Mine operators say they have nothing to arbitrate, and will make no effort to run, but if the men feel disposed to return to work they may do so. The merchants in most instances have no sympathy with the strikers and say they will refuse credit to men who are on strike. There has been no violence, as no attempt has been made to replace strikers with other men, or to work with those who are willing to continue.

Jackson, April 15.

(Special Correspondence).—The Wildman-Mahoney mine closed down on Monday, as the lessees, who for the past two years have been operating the mine, in view of threatening labor troubles, did not wish to assume additional risks. The mine has been unprofitable for some time past, and can only be made to pay by continuing the new Emerson vertical shaft to a depth of 2000 feet or more, and developing new ore bodies in the lower levels. The Central Eureka mine, near town, and South Eureka, on the top of Sutter hill, are closed by reason of the strike of the miners. The superintendents say the mines will remain idle until the men are ready to return and work under the conditions existing before the strike.

Sutter Creek, April 15.

At the Kennedy mine, near Jackson, the machinery for the hoist is in position and the gallows-frame is being erected. The other twenty stamps of the mill were dropped this week.

The chlorination works at the Zeila mine, near Jackson, were ready for operations last week; but, owing to the unsettled condition of the labor situation, they did not resume, says the Dispatch. This may lead to the shipment of the concentrates to the smelter.

BUTTE COUNTY.

There were eleven placer mining locations filed with the County Recorder at Oroville last week.

CALAVERAS COUNTY.

The Del Monte M. Co. (offices at Jackson, Amador county), report for March shows: Distance run on crosscut, 60 feet, total length 721 feet; cost of labor and materials, \$792.50; cost per foot, \$13.20; drift run from west shaft east, 48 feet; cost of labor and materials, \$151.72; cost per foot, \$3.16; road construction, \$16.50. The rock in the crosscut is extremely hard, having the appearance of quartzite, with stringers of quartz running across it. In the drift above the 200-foot tunnel, passed through 75 feet of ore, and cut the Le Foy shaft. Assays along upper drift west of Le Foy shaft average \$10.

It is reported work on the Lamphear and Moser quartz mines near Mokelumne Hill will be resumed. The group is owned by C. A. Westenberg and S. F. Allen of San Francisco.

The 5-stamp mill at the quartz mine on the John Welch ranch, near Milton, is running steadily. The shaft is down 400 feet on an 8-foot vein.

The Louisiana and Gold Standard mines adjoining the Easy Bird, at Mokelumne Hill, have been handed to J. E. King.

EL DORADO COUNTY.

Lawyer & Hart, representing a San Francisco company, have bought the Ancient Gravel drift mine on Cosumnes river, 7 miles southeast of Latrobe, and will begin development next week.

The Medar quartz mine, near Rescue, has been handed to a San Francisco company.

The 5-stamp mill at the Crystal mine on French creek, near Placerville, started up last week after a short shut down on account of the storm. Twelve men are at work.

The Rustlers M. Co.'s mill on the Gamecock quartz mine, Gold Hill district, near Placerville, is expected to be in operation by May 1. The same company have bought the Mammoth quartz mine on the opposite side of Webber creek, 1 mile south of the Gamecock, and are developing it. They report striking a ledge 14 feet wide, the ore averaging \$4.69 a ton. Drifting is in progress. Power is obtained from a ditch leading out of Webber creek.

At the Whim mine, near Fairplay, the shaft has been sunk 40 feet lower and a ledge 2 feet in width uncovered, says G. S. Estey.

Superintendent C. P. Croft has resumed operations at the Independence mine on Slate mountain, near Placerville. Machinery for the mill will be set up.

FRESNO COUNTY.

The Plymouth Con. Oil Co. has put up another rig near Coalinga and begun drilling.—The Rhode Island-California, drilling east of the field, has one well down 1800 feet, with a small showing of oil, and will drill another well.—The Esperanza has suspended drilling temporarily and is pumping its two producers, which are completed.

INYO COUNTY.

The Roosevelt Oil Co. are drilling 9 miles south of Owens Lake, near Olancho, and are down 1000 feet with oil indications showing.

KERN COUNTY.

The Capital Oil Co. will resume drilling on its ground in Kern River field, near Bakersfield. They are putting up a hydraulic rig, capacity 2000 feet.

The Plinmore mine and mill, near Johannesburg, has been leased to F. Ernst of Johannesburg.

The Good Enough Oil Co., composed of Bakersfield men, will operate in the Cuyama district west of Sunset.

Superintendent W. A. Bouchard has completed retimbering the Sunshine shaft, near Randsburg, which was wrecked by the explosion. Bentley & Bull made their first shipment of bullion from the Hard Cash mine last week. They are working the ore with a dry concentrator.

MARIPOSA COUNTY.

The Ellingham mill, at Whitlock, will start crushing ore next week.

Work on the mines of the Austin Group M. & M. Co., near Whitlock, is progressing. They are handling more water in the Ragan shaft than previously and will put in a pump to replace the baling skip.

MONO COUNTY.

The Bodie Miner-Index says the Castle Peak gold mines will be reopened this summer.

The tunnel of the Crystal Lake G. M. Co. at Lundy will cut the vein at 3160 feet in depth. Twenty miner's inches of water have been cut in the tunnel, adding to the company's power supply. Twenty stamps are dropping in the mill and eighty men are at work.

NEVADA COUNTY.

Thirty men employed at the Gold Tunnel mine, near Nevada City, went out on strike last week because Superintendent J. Eddie gave orders for them to take their lunch in the mine, instead of eating on top.

At the Gold Blossom mine, on Union hill, near Grass Valley, work has been resumed by R. Jeffrey, who owns the group.

Superintendent J. McCaffery of the Polar Star mine, near Grass Valley, says construction work has begun on the buildings for the hoist and the mill.

Operations have resumed at the Standard mine at Deadman's Flat, near Nevada City, owned by Mason & Curtis. F. L. Mason is superintendent.

A 10-stamp mill will be put up at the Gold Tunnel mine, near Nevada City. Excavation work has begun. J. Eddie is superintendent.

PLACER COUNTY.

The Sacramento M. & D. Co. was incorporated last week; F. P. Jackson, M. J. Curtis, W. W. Bassett, B. Welch and E. Franklin; to dredge on the Fowler & Gallagher claim on the American river, near Colfax.

PLUMAS COUNTY.

The Bluff City M. Co. has suspended work at its mine near Quincy, but will resume in the spring, when more men can be worked to advantage, says the Grass Valley Tidings.

SAN DIEGO COUNTY.

The March cleanup of the California King G. M. Co.'s mill at Picacho showed a yield of \$21,441 in bullion and \$2225 in silimes, produced from 7033 tons of ore, showing an average value of \$3.70 a ton, says C. H. Fay of New York, secretary. It is proposed to increase the capacity to 450 tons a day this spring. C. K. Humphrey is superintendent.

F. D. Jones, superintendent of the Smoky City M. Co., has resumed developments in the Elevado mine at Banner.

The Julian Miner says the Glades M. Co., operating the Spring and Oxide mines in Pine valley, near Julian, have opened a 14 foot ledge in the Oxide with a 6-inch pay shoot assaying \$125. The ore is part free-milling, the concentrates assaying \$400. Some of the ore will be cyanided. The company has thirty men at work in the mines and mill. An electric plant has been put in.

SANTA BARBARA COUNTY.

The Casmalia Oil Co. report striking a flow of liquid asphalt in boring for oil on the Arellanes ranch, near Santa Maria, after drilling to a depth of 1500 feet. President T. Ferguson says accompanying the asphalt a heavy flow of natural gas was obtained, which forced the asphalt to the surface at the rate of several barrels per day.

SIERRA COUNTY.

It is reported the Diadem mine, near Forest City, which has been closed for two years, will reopen under new management.—The Messenger says the Young

America gravel mine, below Forest City, will resume by May 1. — At the Twentieth Century mine (formerly Mountain View), pay gravel has been struck.

The Punch Creek quartz mine at Humbug, near Hawkinsville, was started up last week under new management, with D. McCook as superintendent.

TRINITY COUNTY.

M. S. Hotchkiss reports that, after five years of prospecting with varying fortune, he has struck the main pay channel of his Wonder mine on Trinity river, near Junction City. The mine adjoins the Keno mines (Five Pines). The gravel averages \$2 to the pan.

J. Whitmore, J. F. Davis and F. H. Hall, who made the original sale of the Sweepstakes hydraulic mine, near Trinity Center, to the Sweepstakes M. Co.—who abandoned it—propose to reopen it.

The Sykes G. M. Co., operating the Bloss & McClary mine at Trinity Center, are working two giants steadily. The bank averages 100 feet in depth and carries good values. Twelve men are employed on each shift, with E. Ellery superintendent.

At the Headlight quartz mine, on the Trinity river, 3 miles above Trinity Center, a break in the ditch caused a temporary shutdown. The Huntington mills are crushing ore, capacity seventy-five tons per day. The vein is 60 feet in width and carries gold values. Superintendent F. Fletcher has eighteen men at work.

At the Dorleska mine, at the head of Union creek, near Trinity Center, thirty men have been working all winter. There are three mills on the group in constant operation. The richest ore is run through the 5-stamp mill and the lower grade through the other two. The ore shoot carrying the high-grade ore is 60 feet long and the vein averages 16 inches in width, says the Free Press. The lower grade ledge averages 16 feet in width. Los Angeles parties own the property and M. McIlwaine is superintendent.

TUOLUMNE COUNTY.

An oil-burning plant is being put in at the Toledo mine, 1½ mile west of Tuttle-town. The shaft is down 400 feet and drifting east and west from the bottom started.

The Magnet says a hoisting engine has been set up at the 1300 station in the Black Oak mine, near Soulsbyville. The shaft will be sunk an additional 100 feet.

The Vine Spring M. Co. has incorporated; principal place of business, San Francisco; J. D. and E. Barnett, G. F. McPherson, C. B. Tilley, J. J. Roche. They will develop the Vine Spring mine, near Columbia. N. Judson is superintendent.

The App shaft at Quartz is down 1300 feet and drifting begun.

The Porto Fino mine, near Carters, will resume May 1.

The Prudhomme mine, near Groveland, has been unwatered and work resumed. Sinking will be started by June 1.

H. W. McPherson of Los Angeles has bought the G. W. Phillipson interest in the Last Chance and Maud quartz mines, near Hall's Crossing on the Stanislaus river, 2 miles from Confidence.

W. L. Holmes of Detroit, Mich., has bonded the John Royal quartz mine on the E. C. Day place, 2½ miles northeast of Columbia, together with water and other rights; also the Stockton quartz mine, adjoining, for \$50,000. Holmes agrees to erect a 10 stamp mill.

The work of extending the Morris tunnel to tap the Bald Mountain pocket mine, near Columbia, is progressing. The tunnel has been run 500 feet since resuming, and another 150 feet will bring the face directly under the pocket workings. The total length will be 1400 feet. Several pocket mines will be operated through this tunnel.

The Santa Ysabel mine on Quartz mountain, near Stent, is being put in shape for resuming. Twenty-five men are working on the surface moving the gallow's frame from the old works 200 feet north, where the three-compartment incline shaft will be sunk, and putting in the cement foundations for the hoisting machinery, says the Democrat.

COLORADO.

BOULDER COUNTY.

The National Con. Oil Co.'s well, east of Boulder, has for some weeks been producing gas, and, on the strength of this, the company has applied for a franchise to pipe gas into the city for commercial purposes, agreeing to furnish it at 30 cents a thousand feet.

CHAFFEE COUNTY.

Manager Hutchinson of the Red Top M. Co., below Winfield, reports good progress on their tunnel. They will put in air drills this spring and will drive ahead into Sheep mountain, which will make three tunnels developing that district.

One enters from the west slope of the mountain at the head of Boswell gulch, and Manager Foster is in 600 feet cutting some gold veins. Another on the northeast slope, with O. A. Brown as manager, has cut a number of veins, some showing gold values.

Superintendent Taggart of the Tasmania C. M. & M. Co. at Winfield has resumed work on the Last Dollar mine on Hope mountain after a temporary shut down.

CLEAR CREEK COUNTY.

E. W. Williams of Denver is operating the Donaldson, Champton and Trio group on Bellevue mountain, near Idaho Springs. The Trio adit is being driven to reach the Champton workings and 130 feet remain to connect. In the Trio he has 20 inches of smelting ore running five ounces gold to the ton, and alongside of it is a streak of milling ore running two ounces gold to the cord. Men are at work in the Champton driving the sixth level east to connect with the Trio. The Champton shaft is down 1100 feet and all of the levels will be driven into the ore shoot. Leasers are working at the Donaldson mine. The Donaldson mill will be remodeled. A tramway runs to the mill from the Champton mine.

Superintendent Rich last week completed a shipment of seventy-five tons of zinc concentrating material from the Pelican mine, near Silver Plume. A contract has been made to ship 10,000 tons of concentrating material from the upper Mendota dumps. At present it is packed from the dump on burros; but other arrangements will soon be made. Operations on the Pelican have been suspended temporarily, waiting for a mill at Idaho Springs to be completed, which will be able to treat the Pelican ore.

At a meeting of the stockholders of the Waldorf M. & M. Co., in Denver, it was decided to bond their group near Georgetown for \$150,000, for the purpose of erecting a mill to treat the large amount of low-grade ore, which will not stand the cost of transportation in its present form; also, to do more systematic development of the mines. Manager E. J. Wilcox's report shows the ore shipped gives returns of \$200 per ton in lead, silver and gold.

FREMONT COUNTY.

Well No. 305, in which the United Oil Co. struck near Florence oil that yields fifty barrels daily, is being put deeper, to determine what underlies the ground where these strata have been found.

C. Cowan of Coal Creek has a ten-year lease on 160 acres of ground 1 mile south of the Chandler mine. He sunk a 160-foot shaft and struck four veins of bituminous coal measuring from 3½ to 4½ feet thick. Additional machinery will be placed.

GILPIN COUNTY.

W. S. Dexter of Denver has let a contract to sink 30 feet on the Iowa Girl lode, which he owns, near Central City, and intends to put in a plant of machinery.

The Delmonico G. M. Co., operating the Delmonico mine, on Quartz hill, near Central City, are erecting a concentrator near their mine. The mill building will be 36x70 feet and capacity of plant fifty tons per day. E. Steffan is superintendent. It is reported Boston parties have bought the Aduddell property in South Willis gulch, near Central City, for \$65,000, and they intend to operate it through the Newhouse tunnel.

Shull, McLeod & Co., working the El Dorado mine, in Leavenworth gulch, near Central City, under a lease and bond, are making regular shipments to the mill of ore running two ounces gold to the cord, with the tailings averaging \$12 per ton, the ore making three quarters of a ton of tailings to the cord, says the Register-Call.

The Boston-Occidental M. Co. is putting in machinery at its experimental plant at American City to handle the ores of the Mascot group.

The Mackey mine, near Central City, is being worked by L. J. Mountz, owner. A tunnel has been driven in 210 feet, obtaining a depth of 100 feet, and has opened up a body of sulphide ore. Machinery will be put in for further development.

Boston parties are arranging to start up the 2:40 property, near Russell Gulch, under a lease and bond with S. Hoskin of Central City as superintendent. The machinery and shaft building on the unexpected property in Lake district will be moved to the 2:40 mine.

GUNNISON COUNTY.

The Forest Hill Con. M. Co. continues development on the Forest Hill group between Dorchester and Tin Cup. It has on the dumps 8000 tons of low-grade ore. The mill erected below the mine, 2 miles, has treated considerable ore, but it is intended to make some changes in the process of treatment.

The Gold Vein M. Co. has incorporated to operate near Tin Cup; G. Loomis, W.

C. Garlock, H. W. Nicbols, Jr., C. F. Wahl and F. W. Loomis. The company's property is near Cross mountain. Developments will begin next month.

The Dora M. Co. has made extensive preparations to operate its Union Park placer, near Gunnison, this season. It has expended \$125,000 in building ditches, flumes and reservoirs, says Superintendent R. W. Spensley. They own 720 acres of placer ground.

The Jersey Blue mill, in Gold Brick district, near Gunnison, will resume.

The Lead Chief, near Spencer, will be operated this summer. It shows 22 feet of lead ore which assays 20% lead, \$4 in gold and a few ounces in silver. The property is owned by F. O. Miller and D. Phelps.

LAKE COUNTY.

The Leadville News-Dispatch says the Western M. Co., representing the mining interests of the Guggenheim Exploration Co. in the Northwest, has absorbed the A. Y. & Minnie M. & M. Co., the Mahala M. Co. and the A. M. W. M. Co. at Leadville, and Ute & Ulay M. Co. at Lake City (Hinsdale county). The A. M. W. represents the Adams M. Co., Maud of Erin S. M. Co. and Wolfstone Con. M. & M. Co. S. D. Nicholson continues as manager of the new corporation. S. Guggenheim is president of the Western M. Co., W. W. Porter secretary; headquarters, New York City.

G. Campton says work will be resumed on the Homestake mine on Homestake mountain, near Leadville, by May 1.

C. B. Salmon of Beloit, Wis., part owner of the Printer Boy mine near Leadville, says operations will be resumed by May 1.

The Caribou mine, near Leadville, has suspended shipments temporarily, having been unable to secure a satisfactory contract from the smelter. The mine had eighty men at work, but this force has been reduced to twenty.

A diamond drill has been put in at the Valentine mine, near Leadville.

The Ibox cyanide mill near the Arkansas Valley smelter, at Leadville, has been leased by the American Zinc Extraction Co. of Kansas City, who will equip it for a concentration and separation mill. The principal ores treated will be zinc.

The Cloud City M. Co. mine, near Leadville, has been unwatered and the drifts and stopes cleaned out. Shipments of manganese began this week.

Manager Mankuss says work has resumed on the Helen Gould mine, near Leadville. The tunnel is in 320 feet and the shaft down 190 feet.

The Park Lode, in Adelalde Park, near Leadville, being operated by the Buena Vista S. & R. Co., J. McAllister superintendent, is shipping steadily from its copper sulphide bodies and development work is being increased.

The total tonnage output of Leadville for March was 72,500 tons. The increased production was largely due to the added demand for iron ores from the smelters, the rise in the price of lead and spelter, and the general ability, by the erection of mills both by the mine managers and the smelters, to treat a lower grade mineral. The Resurrection mill, only running part time last month, is in full operation and handling 140 tons of ore per day. The Home will increase its output of 200 tons a day, while the Diamond and the Valley combination will be additional shippers.

MINERAL COUNTY.

Manager Fitzgerald of the Humphreys mill at Amethyst says operations have been resumed.

PARK COUNTY.

The Apex Copper Co., owning a group in the Lake George district, is putting in a plant of machinery on the property and the four-drill air compressor has been set up. Besides copper the ore runs \$4 per ton in gold.

The Tarry G. M. & L. Co. has been incorporated at Colorado Springs. The company owns two claims in the Mountain Dale district, near Lake George, and development work is under way. They also have a bond and lease on the Last Shot mine, in Boulder county. H. J. Newman, J. Shumaker, C. P. and E. H. Campbell, C. A. Van Horn, C. D. Welmer and O. H. Stanley are directors.

SAN MIGUEL COUNTY.

(Special Correspondence) — The Argentine vein in the Black Bear tunnel site has been cut. Its width on the north side of the crosscut is 12 feet and 11 feet on the south side. The ore is solid quartz, impregnated with iron and copper sulphide, sulphides of lead (galena) and zinc mixed with galena. The gold and silver values are satisfactory. Drifting on the vein will start at once and preparations made for stopping.

Telluride, April 11.

The crosscut tunnel being driven by the Black Bear M. Co. for the development of

its group at the head of the left fork of Ingram basin, near Telluride, has cut the Argentine lode at a depth of 500 feet, in a body of quartz 12 feet in width. The company owns fourteen lode claims, a millsite and a placer of thirty-five acres. It is proposed to put in a stamp mill next summer. Z. Anderson is president.

SUMMIT COUNTY.

Manager Benyle of Denver, of the Bledsoe M. Co., near Kokomo, says they will resume.

J. M. Thomas of the Fremont-Vlneta M. Co. says a mill will be built on the Swan mine, near Breckenridge, next summer.

The Wilsey mine and mill, near Kokomo, have resumed, says Manager E. E. Byron. Seven tables have been added to the mill equipment.

A strike is reported made in the Rothschild tunnel, near Montezuma. In the crosscut being driven for the last two years with machines, at a distance of 2300 feet from the portal and a depth of 1000 feet, they cut a cross vein of high-grade ore, showing native silver, ruby silver and gray copper. This tunnel starts adjoining the western portal of the Brick Pomeroy tunnel, at Argentine Pass. — The Ohio M. Co., near the same place, report opening up another body of lead-silver ore. This company bought the Pennsylvania mine last summer and will start their mill next month.

TELLER COUNTY.

The Star G. M. Co. has resumed on their Guyot hill group at Cripple Creek and are driving to make an air connection with the Dan McDonald farther up the hill.

The Cripple Creek Ore & Sampling Co. at Cripple Creek resumed operations last week. The company received its first ore from Stratton's Independence, which has its sampling done here, and ships on an average 250 tons of rock daily.

Full operations have been resumed on the Portland No. 2 shaft, repairs to the hoist and gallow's-frame having been made. The new tramway to be used in conveying waste rock from the No. 2 shaft is running. This conveyor is operated by electric power on the trolley system, the buckets dumping automatically while in transit and returning to the shaft house.

The terms of agreement between the Portland G. M. Co. and Colorado City M. & S.'s Union No. 125, relative to the scale of wages and general rules governing the treatment of men, are as follows: The rates being for eight hours' work.

OUTSIDE OF MILL.

	Per Day.
General labor.....	\$2.50
Laborers in shops.....	2.00

IN MILL.

Oilers.....	2.50
Ore unloaders.....	2.40
Crusher feeders.....	2.25
Sample roll men.....	2.50
Sample cutters.....	2.50
Trammers from hoppers.....	2.25
Ore bedders.....	2.25
Bedding floor wheelers.....	2.40
Roll men.....	2.50
Roll helpers.....	2.25
Screen and dust men.....	2.50
Head roaster men.....	2.80
Helpers on roasters.....	2.25
Barrel house foremen.....	3.00
Other men employed continuously about chlorination barrels.....	2.50
Precipitators.....	3.00
Precipitators' helpers.....	2.50
Head concentrator men.....	3.00
Helpers on concentrators.....	2.25
Head machine repairer.....	3.00
Blacksmith.....	3.25
Blacksmith helper.....	2.25
Machinists.....	3.25
Sheet-iron workers.....	3.00
Pumpmen.....	2.50
Boiler firemen.....	2.50
Carpenters.....	3.50

Helpers in shops are paid a minimum of \$2 per day and upward, according to their ability as estimated by the master mechanic.

It is expressly understood that men are hired without discrimination as to their membership in any union and are kept in the employ of the company strictly upon their merits as workmen.

It is also a rule of the company that no agitation of any kind is permitted on the grounds, and that men who make themselves in any way disagreeable to either non-union or union men by arguing or discussing matters not connected with the company's work shall be discharged.

It is agreed by the Mill and Smeltermen's Union No. 125 (W. F. M.), that this scale of wages shall be adhered to for one year, beginning April 1, 1903, and that during this period no attempt will be made by said union to raise the scale.

JAMES F. BURNS,
President Portland G. M. Co.

We, the undersigned members of one

certain executive committee, duly appointed by the Mill and Smeltermen's Union No. 125, Western Federation of Miners, to confer with the Portland G. M. Co. in regard to the scale of wages at the chlorination mill, do hereby accept the attached scale as the true and correct scale adopted and accepted by said Mill and Smeltermen's Union.

In witness whereof we have hereunto set our hands and seals this ninth day of April, 1903.

CHARLES LYON,
H. L. SANGER,
J. H. HILL,
F. M. EDELEN,
L. N. EDWARDS,

Executive Committee M. and S. U. No. 125.

E. R. BURR,
Representative W. F. of M.

The action of the above executive committee in accepting the attached scale of wages is hereby ratified and confirmed by the Mill and Smeltermen's Union No. 125, Western Federation of Miners, by its duly elected president and secretary, and the seal of said union is hereby attached.

THE MILL AND SMELTERMEN'S UNION
No. 125 (W. F. M.)

By L. N. EDWARDS, President.

Attest:
(Seal.) WILLIAM R. ENNIS, Secretary.

The main working shaft of the New Haven, on Raven hill, Cripple Creek, is being sunk an additional 100 feet, and heavier machinery will be added to the equipment.

The Gold Cord Co., operating Blocks 13 and 14 of the Bonanza King, on Gold hill, Cripple Creek, is putting in a steam plant of machinery on its lease. The shaft is down 180 feet, and ore has been opened in three levels averaging \$25 to \$30 per ton, the best showing being on the 135-foot level.

Unwatering the shaft of the Mohawk Belle, near Cripple Creek, is finished and operations resumed.

The Mary Jane Co. has granted a lease on the south end of the Golden Wedge claim, on Raven hill, Cripple Creek, to the Globe M. & R. Co., composed of local men. The Globe Co. are building a cyanide plant at Goldfield and expect to start operations by May 1. They also have a four-year lease on the Ironclad mine, on Ironclad hill. On the Golden Wedge claim there is a vein 9 feet in width of low-grade ore that is amenable to cyanide treatment.

President F. L. Sigel of the Vindicator M. Co., at Cripple Creek, says the winze from the tenth level is down 50 feet, and a north drift in the twelfth level is being run to get under the winze and connect, to give ventilation. The vein in the tenth level at the head of the winze is 26 feet wide and good grade. They are drifting south of the tenth level to open three veins that have been cut in the last year in that section of the mine, and are out 300 feet, with 200 feet more to go before coming to the Sigel vein, opened in cutting the upper workings. The flow of mine water has decreased.

The Arequa mill, in Arequa gulch, near Cripple Creek, was totally destroyed by fire on the 11th inst.; origin thought to have started in the boiler room. The mill cost \$100,000 (insured for \$65,000), and was under lease to Hamilton, Young & Co. This lease was to expire this month, and another lease had been granted to the King-Craig-Metals Extraction Co. of Milwaukee, Wis.

The Cripple Creek Times says the work of driving the drainage tunnel is progressing. From the portal into the connection with the 1000-foot level of the El Paso shaft is 4078 feet, and 1226 feet have been completed. Work has ceased from the intermediate shaft, as the west drive has connected with the drive from the portal, and from the portal one heading is being driven, being in 798 feet. Driving is in progress from five headings, and they are making on an average 35 feet a day. From the east end a drive is being made toward the water course and will continue until the water reaches a certain number of gallons per minute, when that will be bulkheaded until the tunnel is completed from the portal and connected; then the east drive will be completed to the water course in the territory of the Black Belles Co. The water is receding and lowering about 1 foot per month and is now standing at an elevation of 9028 feet above sea level (i. e., at a point 24 feet below the Standard tunnel). Whether the suspension of pumping operations at the Gold King will make any difference has not been ascertained as yet.

Last week the Portland M. Co. put fifty additional men to work on its mines at Cripple Creek. The company is sorting 250 tons of ore per day.

The Work M. Co. has granted a lease on the north 600 feet of the Poorman claim at Cripple Creek to a local company, who will develop it through the Morning Glory shaft of the Doctor-Jack Pot Co.

Operations will be carried out through the 545 foot level.

The Vindicator M. Co. at Cripple Creek will put in another boiler of 267 H. P., bringing their total boiler capacity up to 797 H. P. This increase is needed because of the added pumping necessary.

Gold is reported on the south slope of Grouse mountain, between Wilson creek and Marigold, near Cripple Creek, and a large number of locations have been staked. L. Kafna says he has opened up at a depth of 180 feet ore assaying \$12 gold and 9% copper.

IDAHO.

BOISE COUNTY.

It is reported the Twin Sisters mine, at Centerville, will resume.

IDAHO COUNTY.

The Glasgow-Dundee Con. G. M. Co. has been incorporated at Joplin, Mo., consolidating the Glasgow and Dundee groups and the Missouri group. These groups are in the Big Creek section, Thunder Mountain district, near Roosevelt. The Glasgow and Dundee were under bond to J. D. Cameron of Joplin, Mo., and the Missouri group was under bond to H. L. Hollister and F. C. Rutan. Development work has been done on the Glasgow and Dundee crosscut, which runs through several of the ledges.

The gold bullion produced during March at the American Eagle mine at Elk City amounted to \$8500, says C. K. Merriam, a director of the company. This is somewhat less than for the previous months, but it is due to a considerable quantity of lower grade ore having been run through the mill. The total output of the mine, exclusive of concentrates, since the mill began operations in January, amounts to \$25,000. The upper tunnel gives a depth of 125 feet, while the lower one gives 200 feet. In each the ledge is 20 feet wide, the pay shoot being 6 feet, assaying \$20.

The Sunnyside Co., in Thunder Mountain district, near Roosevelt, is working nineteen men. A 900-foot tunnel has been driven during the winter and is in paying ore. On the Burr Oak claim of the Sunnyside group a 400-foot tunnel has been driven. The company will erect a mill in the summer on Sunnyside creek, $\frac{1}{4}$ mile from the mine.

The Gold Reef M. Co., near Roosevelt, J. Jewell manager, have had men at work all winter. They have driven a 160-foot tunnel on the Monumental group.

LEMHI COUNTY.

The Abandoned mine on Rapps creek, 4 miles from Leesburg, is being developed, says the Lemhi Recorder, and the lead opened up shows 78 feet of ore. The formation is granite, quartz and oxidized iron. The dyke has been cut to a depth of 160 feet, showing free gold ore, the average being \$5 per ton. The conditions are said to be favorable for either plate or cyanide treatment.

The Gold Dust M. Co. will install a 50-stamp mill at its mine near Lemhi this summer, says R. E. Plough of Deseret, Utah, a shareholder.

OWYHEE COUNTY.

The Silver City Nugget reports that J. J. Baker and H. Dye have found the old channel of Rich gulch, near Silver City, and traced the pay gravel for 800 feet. They have filed placer locations, relocated the water right on Sawpit gulch and the abandoned Sullivan ditch.

SHOSHONE COUNTY.

The Wild Rose 3-stamp mill, near Pierce City, started crushing last week. The company has large reserves of ore blocked out and is figuring on a larger mill to be put up this summer.—C. H. Lewis of the Portland and Seattle group reports the tunnel in 60 feet, with 2 feet of ore in the face. The Seattle crosscut is in 90 feet.—Work will be resumed on the Stars and Stripes by May 1.

The Black Cloud mill, on Nine Mile, near Wallace, has been closed for several months. There is sufficient ore blocked out in the California to warrant its continued operation, says the Record.—The Snowstorm tunnel is in 840 feet. There is an abundance of water, and the miners are making an average of 250 feet per month; chalcopryite and hornite are being found. The breast of the tunnel is in porphyry and quartzite. Nine hundred feet remain to be run to cut the main ledge of the Snowstorm group.

WASHINGTON COUNTY.

Manager E. D. Ford says a 14-day mill run of the cyanide plant at the Salzer Ford group at Black Lake, in the Seven Devils district, near Weiser, has proven a success. Tailings show 20 cents per ton.

MICHIGAN.

ONTONAGON COUNTY.

The management of the Victoria mine

at Victoria have begun sinking No. 2 shaft for the nineteenth level. The crosscut at the sixteenth level shows the ledge 50 feet wide with heavy copper for 15 feet on the hanging wall and stamp and barrel copper running through the ledge.

MONTANA.

The report of the United States assay office at Helena for the month of March shows the total receipts of gold for the month, \$177,476 53, of which \$141,473 33 was from Montana, divided as follows: Lewis & Clarke county, \$24,820 51; Fergus county, \$71,095, and Granite county, \$25,562 94. The reason for the greater showing from Fergus county is that the Fergus county ores are worked by mills and cyanide plants, while in the other a large proportion of the gold ores go to the smelters so that their product does not reach the assay office.

BEAVERHEAD COUNTY.

The Watseka mine at Rochester is employing 200 men and the twelve-table mill is nearly completed. The company expects to double its force June 1st.

LEWIS AND CLARKE COUNTY.

The Golconda G. M. Co. has been incorporated at Helena.

R. A. Ball of Helena has closed a deal with Philadelphia men for an interest in the B. & G. mines, 20 miles from Helena, near the Bell mine. There is a shaft 250 feet deep showing a lead of ore which nets \$20 per ton at the smelter. The lead is 20 feet wide in the lower workings. Latsch Bros. & Huffaker are driving a crosscut from the Bland lead—one of the B. & G. group—and have struck a 6-foot vein which shows good ore.

MADISON COUNTY.

Copper-gold ore is reported struck at a depth of 250 feet in the claim of A. Johnson, near Iron Rod, near Pony, a 92-foot ledge being crosscut by a tunnel. The ore from this ledge runs 15% copper and \$15 in gold. A second tunnel is being run, which will tap the ledge at a depth of 900 feet.

The Hennepin Ore Co. has secured control of the Old Galena mine, near Pony, and has men at work.

PARK COUNTY.

The Revenue 40-stamp mill has been started by the Kimberly Mountain G. M. Co., near Livingston. The cyanide plant is expected to be in operation by May 1st.

SILVER BOW COUNTY.

The Pittsburg & Montana C. Co. will build a smelter at Butte on the flat below Columbia Gardens, and machinery is on the ground for preliminary work.

TETON COUNTY.

H. C. Howell & Co. have located 1920 acres in Chief Mountain district, near Choteau, and the Montana & Swift Current Oil Co. is preparing to start drills in several places.

NEVADA.

ESMERALDA COUNTY.

(Special Correspondence)—The mill on the Nevada Chief mine has started up. Stopping and developing work in the mine is being pushed. The erection of a cyanide plant is in progress. Algernon Del Mar is superintendent.

Pine Grove, April 12.

LINCOLN COUNTY.

At the Southern Nevada mine, near Searchlight, the south drift, 330-foot level, is in 180 feet, and a west crosscut is being run. Ore is being hoisted from No. 4 shaft; depth, 70 feet. The mill is averaging forty tons a day. In the engine room are two gasoline engines—one a 10 H. P. special electric, the other 28 H. P. Both are equipped to use Coalings, Cal., crude oil. The average number of gallons used daily is eighty-five. (The larger engine alone would consume the same number of gallons of distillate.) Distillate costs 30 cents a gallon laid down here, Coalings crude but 9 cents. When the company used steam, as high as twenty cords of "joshuas" (Spanish Bayonets, a native growth of cacti) were burned a day, costing \$2.25 a cord.

At Deer Lodge, near Fay, in the Homestake mine, recently bought by the Newport & Nevada M. Co., 800 feet of work in shaft and drift work has been done and a body of ore opened up. The company has men sinking from the bottom of the old shaft and opening up additional ground. The values average \$12 gold. The company will erect a 5-stamp mill this spring. The Irus group, which joins the Homestake, has been bonded by G. H. Smith.

E. Freudenthal has an option on the Alpes and Price mines, east of Pioche, and has begun retimbering the shaft. Considerable work will be done in prospecting for the vein formerly worked.

E. Wagner, at Knob Hill, near Search-

light, says at the Wagner Bros' mine the mill is crushing \$40 ore. They are putting in a cyanide plant. Their mill returns show \$30 saved on the plates, the rest going into the tailings.

The Irus G. M. Co. has incorporated at Deseret, Utah; O. J. Sallsbury, G. H. Smith, G. F. Putnam, J. W. Donnellan. The company owns the Nevada lode and a bond and lease on the Irus group, in the Eagle Valley district.

At the Quartette mine, near Searchlight, the 10 stamp mill was put in operation last week—run by a 34 H. P. gasoline engine. A 100 pound shipment of cyanide slimes was made last week to the smelter.

T. W. Olsey has a thirty days' option on the Badger and Mountain Jewel groups of mines near Newberry, near Searchlight.

The Mendha mines, near Pioche, are reported closed down.

NYE COUNTY.

The Molly M. Co., near Butler, will sink their shaft to 500 feet, and at 300 feet a level will be run. A hoist will be put in next month.

STOREY COUNTY.

Manager Ryan reports for the week ending April 11 that at the Con. Cal. & Va. at Virginia City no work was done on the various levels of the mine during the week, due to repairs being made to the hoist. The broken shaft was shipped to San Francisco, Cal., to be welded. To hold the water below the station one of the Reider pumps was in operation during the week, assisted occasionally by another of the same system.

In the Sierra Nevada 1600-foot level the station for the electric motor and blower was completed.

The joint Sierra Nevada and Union east drift from the station advanced 16 feet, total length 444 feet; face in softer material.

At the Utah the concrete foundation for the hoist is being finished.

Work has been resumed at the Woodbury cyanide plant, near Virginia City.

WASHOE COUNTY.

The Galena Hill G. & S. M. Co. has been at work on its group, 12 miles south of Reno. A tunnel is being run to tap the ledge, the face being in quartz that assays \$3.50 a ton.

WHITE PINE COUNTY.

W. H. Edwards & Co. of Salt Lake City, Utah, have bought a group of copper claims comprising the Grand Deposit, Kansas, Defiance, Blue Hen and seventy-six others, and the Noe and Cameron ranches, with ample water rights for all milling and smelting purposes in Munsey Creek district, 35 miles from Cherry creek. They will put up buildings, hoists, compressors and mill machinery. Later a smelter will be erected.

NEW MEXICO.

GRANT COUNTY.

Reports from Hanover say Phelps, Dodge & Co. are increasing development on their group and a mill has been erected. J. W. Bible is mill superintendent.

C. E. Derbyshire is operating the Pinos Altos G. M. Co. group at Pinos Altos, under lease, and is also subleasing.

OREGON.

BAKER COUNTY.

Manager W. L. Vinson of the Emma mine, in Virtue district, near Baker City, says the 25-ton Bryan mill is in operation and a hoist has been set up at 800 feet in the tunnel. The ore averages \$20 per ton and is free-milling.

E. A. Ludwig says the B. & M. and two other mines in Greenhorn district, near Sumpter, have been bonded by Ludwig & Co., who own a group of mines in this district, one of which adjoins the Morning group.

C. Bradley of Spokane, who has taken up the option on the Jay Gould, near Whitney, is arranging to operate on a larger scale and will put up a 10-stamp mill this spring. A crosscut has been driven from the lowest workings on the Jay Gould to open a parallel vein, which is 250 feet distant, and will be finished this week. Three hundred feet beyond this vein is the Oregon, a 4-foot vein.

The Alpha & Omega group of Cove district, near Sumpter, says Manager J. T. Grayson, will resume.

The Killen - Warner - Stewart Co. of Sumpter started operating their placers last week. These include the Pine Creek, near the Bonanza, the Olive Creek, in the Greenhorns, and the Stices Gulch, all equipped with machinery for carrying on work. The Pine Creek—F. A. Bates superintendent—has three reservoirs, which were built last fall, two hydraulic plants, and an elevator to dispose of the tailings and save dump room. The Olive Creek—D. T. McCoy superintendent—has added a No. 2 plant to the two No. 1s already on the ground. A new ditch was

opened up last fall and two reservoirs built. The Stices Gulch placers—J. S. Kenyon superintendent—have three reservoirs, together with giants and other equipment. Last fall piping ditches and 2300 feet of flume were constructed. In addition there is a sawmill.

E. Bamberger of Salt Lake City, Utah, manager of the Gold Ridge M. Co., 4 miles from Durkee, says the pumps are raising water from the shaft below the tunnel level, and next week crosscutting to the ledge will be resumed.

The last 50 feet of the drift on No. 3 vein of the Monumental mine, near Sumpter, has been in a shoot of ore showing ruby silver, with gold values, says C. J. Allen, the owner.

JACKSON COUNTY.

The United States M. & M. Co. has been incorporated by E. A. L. Smith, F. J. Catterlin and J. R. James, to operate a group of mines in Water gulch, Sam's Creek district, 2½ miles from Gold Hill.

JOSEPHINE COUNTY.

The Gold Bug mine, on Mount Reuben, near Grants Pass, has been temporarily closed down, due to an impending change of management. The mine is opened to a depth of 600 feet and shows high-grade ore.

The Copper Stain mine, on Mount Reuben, owned by Dana Bros., will have a stamp mill and other machinery.

GRANT COUNTY.

The tunnel being driven on the Equity group at Quartzburg has opened the second shoot of ore, says Manager W. J. Hughes. The length of the first opened was 120 feet. A concentrator is being put in.

The Empire G. M. & D. Co. of Sumpter has decided to put in dredgers on Canyon creek, a tributary of the John Day river, near Canyon City.

Manager J. W. Carr last week resumed work on the group of the Denver G. M. & M. Co., near Alamo.

SOUTH DAKOTA.

LAWRENCE COUNTY.

It is reported that the Clover Leaf Co., near Roubalx, has struck the pay shoot on the 700-foot level in the Uncle Sam mine.

G. Bertschy, former superintendent of the Tycoon M. Co., has an option on one of the Gertie group, formerly owned by the Harney Peak Tin Co., near Hill City, and has begun operations.

C. K. Shoemaker has begun operations at his mica mine, 3 miles southeast of Custer.

The Horseshoe M. Co., W. L. McLaughlin manager, has resumed work at the Lucille mine, near Terry, and has begun ore shipment. They have started construction work again at the cyanide plant at the Mogul mine, which is expected to be in operation by June 1st. It will have an initial capacity of 500 tons a day. The ore will be crushed by stamps, in the solution of cyanide. It is the intention to put up an aerial tramway for the delivery of ore at the mill.

UTAH.

BEAVER COUNTY.

The annual report of the Horn Silver M. Co., at Frisco, shows \$109,707 receipts from sales of ore. The amount of ore mined was 12,159 tons, of which 4549 tons were shipped crude, the rest being treated in the mill. The first-class crude ore brought \$41,644; the copper ore, \$35,397, and the concentrates \$29,583. The metallic contents of the ore were 203 ounces gold, 112,813 ounces silver, 717,353 pounds copper and 3,657,062 pounds lead.

GRAND COUNTY.

The Dirlgo-La Sal M. Co., on Deep creek, near Basin, in the La Sal mountains, report striking a vein in the cross-cut tunnel, which carries tellurides. The find was made near the hanging wall of the Mollie Gibson vein, which group is owned by this company. A reduction works will be built, says Assistant Manager S. W. West of Salt Lake City.

JUAB COUNTY.

Manager E. Bamberger of the Alaska mine, in Tintic district, near Eureka, says the drift from the 600-foot station of the main working shaft has cut the vein from which ore was taken out on the upper levels. The drift is in 75 feet.

Present shipments made from the Victor mine at Eureka show values of \$25 per ton. For March the shipments amounted to twenty-five cars of ore, and Superintendent Treloar expects to increase the output this month.

PIUTE COUNTY.

(Special Correspondence).—The stockholders of the Annie Laurie Extension Co. have increased the capitalization of

the company because of recent developments on the original group, and to pay for additional ground bought. L. H. Outzen is president. The northern line of the Extension group of twenty-three claims is 1200 feet south of the Annie Laurie on Gold Mountain. There are 3500 feet of tunnelling projected, which is expected to open up the Annie Laurie vein at depth. The surface of the Annie Laurie Extension shows rich quartz. The Extension's ore is similar to that of the Annie Laurie. The Belpat, in Sevier River canyon near the Denver & Rio Grande Western Railway, north of Marysvale, has opened up good ore. W. C. Kenbedy is president. The Snowbirds has opened up the ore shoot at a depth of 300 feet. At the B. W. & H., Superintendent J. W. Billingsly says they have five ore-bearing veins. This week they have opened up a vein 6 feet in width, all ore, 18 inches of which runs \$95 per ton, and the rest averages \$20 per ton. About 1000 sacks of ore are on the dump ready for shipping.

R. De Witt, working the Overlooked, has struck a 4-foot vein in the "bird's-eye" porphyry, assays showing high values in gold and some silver. The Tribune Co. has bonded its group of claims, southwest of the Annie Laurie, to A. H. Franklin for \$45,000. In connection with the Tribune group, Franklin has a bond on the Cummings claims to the east and will open up these properties by means of the 1200-foot tunnel on the Tribune. The Denver & Rio Grande Western Railway has its terminus at Marysvale, and all of these districts can be easily reached from this place.

Marysvale, April 6.

(Special Correspondence).—F. Lallay has located copper claims in Sevier canyon.

The B. W. & H., on Sevier river, continues its output. Shipments are suspended for the present. Extensive developments are being carried on, says Superintendent Billingsly.

W. H. Holderman of Salt Lake is reported as having a bond and lease on the Deer Creek group, and will use his application of the cyanide process in the treatment of the ores.

J. A. Kerr of Denver, Colo., is in camp, representing Duluth, Minn., and Pittsburg, Pa., capital, to secure prospects for development.

M. Krotki, manager of the Perdue-Surprise, is working a large number of men with encouraging prospects.

Marysvale, April 12.

SUMMIT COUNTY.

The Liberty M. Co. has incorporated to work a total of 265 acres of mineral-bearing ground near Park City, including the McHenry Gulch, the Wasatch, Belcher and Romeo groups—T. Kearns, W. M. Ferry, J. Green, J. T. Richards, E. S. Ferry.

The Comstock M. Co. mill at Park City is in operation, says Manager M. Dusseldorf.

TOOELE COUNTY.

The Honoline drain tunnel at Stockton, says Manager W. F. Snyder, cut through the porphyry and entered the limestone formation at a distance of 3900 feet from the mouth last week, tapping a water course, and the water came out at the rate of 2000 gallons per minute. Several mines in the vicinity are beginning to note its effect already in the lessened amount of water to be handled.

A strike of copper ore is reported made in the Ferber district, 25 miles from Ibapah and near the Nevada state line, on claims owned by Garrison, Lewis & Loomis.

O. Sheridan reports that coal has been found between Sanford pass and Weaver canyon, 25 miles from Ibapah.

WASHINGTON.

FERRY COUNTY.

The electro-chemical mill of the Republic Reduction Co., near Republic, will be dismantled.

STEVENS COUNTY.

The Bodie mine on the Colville reservation, near Colville, will have a 10-stamp mill this spring, says C. M. Fassett, one of the shareholders in the company. They expect to adopt a combination of amalgamation and cyaniding. The Bodie carries gold and silver. A shipment of three carloads made recently went \$50 per ton. W. G. Madison of Spokane is president and manager.

WYOMING.

CARBON COUNTY.

S. Fuiks of Battle has bought the Itmay group of four claims 4½ miles west of the Verde mine.

FREMONT COUNTY.

J. H. Lobell, at Cheyenne, American director of the Societe Belgo-Americaine des Petroles du Wyoming and the Belgo-

American Drilling Trust, says his company last week bought the Murphy fields in the Popo-Agie district, near Lander, for \$450,000. In these fields are thirteen producing wells. The deal includes 30,000 acres of oil lands in the Popo-Agie district and in the Rattlesnake and Beaver basins. The company has also bought 5000 acres of oil lands in the Rattlesnake field of Natrona county. They own 30,000 acres in the Salt Wells fields of Sweetwater county and a tract in the Salt Creek basin of Natrona county.

UINTAH COUNTY.

The Round Mountain Oil Co. has been incorporated by Evanston, Wyo., and Sidney, Neb., men to operate in the Uintah field near Evanston.

FOREIGN.

AUSTRALIA.

WEST AUSTRALIA.

(Special Correspondence).—W. A. Prichard (formerly superintendent of the Keystone mine, Amador City, Cal.) and W. J. Loring (former mill superintendent Utica G. M. Co., Angels, Cal.) have been appointed general managers of Bewick, Moreing & Co.'s interests in West Australia, which control twenty paying mines with a combined production of about 60,000 ounces of gold per month. They are operating 480 stamps. The firm of Bewick, Moreing & Co. consists of C. A. Moreing, H. C. Hoover and T. W. Wellsted.

Leonora, W. A., Feb. 19.

BRITISH COLUMBIA.

(Special Correspondence).—Velvet shipments from Jan. 1 to March 25, 1903, show: 2075 tons dry ore, 1507.16 ounces gold, 1867.4 ounces silver, 147,933 pounds copper. Net returns from smelter, \$30,389.91.

Rossland, April 10.

The Rossland Miner says the condition of the Coal Creek mines, near Fernie, is such that shipments have resumed in small quantities, but it will be some time before the mines are in full operation. The "high line" of No. 2 is the only place as yet workable. The lower levels of No. 2 have not been fully repaired since the explosion, and this work will be continued. No. 1 is in shape and is shipping. In No. 3 a long delay will follow. The company was making successful efforts to keep it pumped during the strike, but owing to the interference of the mob the pumps were stopped and became frozen up. It is estimated it will take three weeks to pump it out and repairs made.

The name of the Kettle river mining division has been changed to that of the Greenwood mining division, to take effect May 1.

Returns received by the Providence M. Co. of Greenwood for a car of ore sent to the smelter last week showed twenty-two tons; gross value, \$161.49 per ton; net returns, \$155.05 per ton. The assays gave: Gold, 2.17 ounces; silver, 265.2 ounces, and lead, 6%.

The Payne mine at Sandon is grading and cribbing the site for the zinc roaster. The mill is running steadily turning out fifteen tons daily of lead and zinc concentrates. The ore shoot struck on the No. 8 level has been opened up for 130 feet, showing a shipping grade all the way.

Carpenters are framing timbers for the Nickel Plate mill at Okanagan.

A 5-drill compressor will be put in at the Seattle claim, north fork of Kettle river, near Phoenix, and under bond to the Trail Smelter Co. R. H. Hutchens is superintendent. It is the intention to quarry the ore of the lower grade, of which there is a large outcropping, and which can be gotten out cheaply, and the higher grade of ore taken out in course of development work will be shipped. It is reported ore was found on the Seattle last week showing 25 feet, running \$40 per ton.

The recent cold snap enabled a number of Fraser river placer miners to work a larger portion of the gravels in the exposed bed. The intense cold and the continued frost caked the smaller streams into ice so that they ceased to flow. This made the Fraser unusually low, and Indians and Chinese who live in the region from Yale to Lillooet washed out gold while the frost lasted. W. Dodd, government agent at Yale, says rich placer diggings were discovered last week on a low water bar on the north shore of the Fraser river, opposite Yale, known as Sawmill Riffle. Companies are washing from \$15 to \$70 a day to the rocker.

It is reported the Emma mine, at Summit, in the Boundary district, which has been shipping steadily to the smelters, the ore being used largely as a flux, will discontinue shipping for a time, but development work will continue.

At the Velvet mine, near Rossland, shipments to Le Roi smelter have been temporarily suspended, due to the condi-

tion of the wagon road to the Red Mountain railroad. Meantime stoping is being continued and the ore extracted stored. Development will be increased.

MEXICO.

DURANGO.

The mines of the Vacas-Quebradillas Junction M. Co., near Quebradillas, are shipping high-grade ore to the Monterey smelters. E. Williams is general manager.

MORELOS.

The Trinidad M. & S. Co. are packing in from Iguala sixty-six tons of machinery 60 miles to their mines in the district of Aldama. There are 3600 tons of ore on the dumps, which averages two-thirds of an ounce of gold per ton, of which 96% can be recovered by the cyanide process.

OAXACA.

In Tavicke district, near Ocatlan, the Tavicke M. & M. Co. expects to have its mill completed and running by May 15. It is an amalgamation and concentration plant of 100 tons daily capacity. The ore carries gold and silver.

SONORA.

(Special Correspondence).—The Gold Coin P. & D. Co., at San Javier, is operating the Gold Coin Meza Mexicana at Meza, where the ore runs from .40 to .60 ounces in silver, 6% to 11% copper and some gold. The ore bodies are over 50 feet wide. They will install a new plant of machinery, consisting of hoist, boiler and water jacket smelter. The same company is operating the Santa Rosa and Tosta at San Javier. The main shaft is down 250 feet, with drifts at each level. They are doing development work preparatory to shipping ore to the smelter at Toledo. The company is composed of metallurgists, mining engineers and machinists, backed by Boston men. The party drove through from Colorado Springs, Colo., prospecting on the way, and finally located at San Javier. L. Ginger is manager, John Moy assistant manager.

The Wyman M. Co., operating the Las Animas mine, will erect a concentrating mill and hoisting plant. One shaft is 300 feet deep, one 150 feet and one 220 feet. They are doing development work. The ore runs from 100 to 150 ounces in silver and 8 to 10 ounces in gold. G. Wyman is manager, L. C. Wyman assistant manager, J. Miller superintendent.

San Javier, March 23.

(Special Correspondence).—T. S. Lamberson has five claims in the district of Montezuma, south of Douglas, Ariz., which he is developing. One of the veins is 15 feet wide and runs high in silver, with one ounce gold. One of the claims adjoins the Lucky Tiger, sold recently for a large amount.

Montezuma, April 1.

It is reported that the Greene Con. Co. at Cananea, W. C. Greene president, will build a factory near their smelter for the manufacture of copper and tin ware.

TABASCO.

F. N. Lister, secretary of the Tabasco Oil Co., says drilling operations are under way in the oil fields of Macuspansa.

The La Luz G. M. Co. report for nine and one-half tons of ore from the La Luz mine at Maguarichic, shipped last week, a net return of \$6326 from the smelter.

W. C. Rollins, manager of the Buenos Aires M. Co., says he has completed the Huntington mill at Cusihuiriachic. The process is pan amalgamation and settling tanks are used. The ore is said to be free milling silver, running 300 ounces per ton.

Obituary.

S. MORGAN SMITH, president S. Morgan Smith Co. of York, Pa., and the Atlanta Light & Power Co. of Atlanta, Ga., died at Los Angeles, Cal., on the 12th inst., aged 64 years.

JAMES ROSS, a veteran prospector and mining man, died on the 5th inst. at Sumpter, Or., of paralysis, aged 60. Deceased was born at Sherbrooke, Canada, and was a Confederate veteran of the Civil War.

T. W. POINDEXTER, a pioneer mining man of California and Canyon City, Or., died on the 10th inst. at Dillon, Mont. Deceased was born in Danville, Va., March 27, 1829. He was at one time mayor of Dillon, and leaves a widow and five sons.

P. EICHELROTH, superintendent of the Fricott & Miller mine, near Latrobe, El Dorado Co., Cal., was killed April 10th, having accidentally shot himself with a 22-caliber rifle while riding in a cart near Michigan Bar. Deceased was a graduate of the University of California.

PERSONAL.

G. S. HOLMES of Salt Lake City, Utah, is in New York.

C. R. BROWN has returned to Nogales, Ariz., from Kansas.

J. M. LESZYNSKY of Denver, Colo., is in San Francisco, Cal.

R. J. PROVINIS of Grass Valley, Cal., is in San Francisco, Cal.

F. MCNAMEE is in Salt Lake City, Utah, from De Lamar, Nev.

P. E. C. BURK, of Cripple Creek, Colo., is examining mines at Alamo, Or.

S. MCGIBBON, a mine owner of Elk City, Idaho, is in Spokane, Wash.

N. TREWEEK of Salt Lake City, Utah, is taking a trip through California.

J. S. CAIN of Bodie, Cal., is in San Francisco, Cal., on mining business.

W. CABLE returned last week to Sumpter, Or., from an extended trip East.

D. FALCONER is superintendent of the Annie Laurie mine, near Colfax, Cal.

M. M. ESTY, of Leadville, Colo., is examining mines in Tonopah district, Nev.

P. V. MOLSON has returned from British Columbia to Salt Lake City, Utah.

MAURICE WALKER will represent the Pacific Steel & Wire Co. in Portland, Or.

G. W. MAYNARD of New York is examining mining property at Idaho City, Idaho.

WM. T. MACDONALD goes from Los Angeles, Cal., to Chimpas, Chihuahua, Mexico.

OWEN BYRNES, manager of the Empire mine, Marysville, Mont., is in Chicago, Ill.

J. M. THOMAS of the Fremont-Vineta M. Co. at Breckenridge, Colo., is in Chicago, Ill.

W. J. NELSON, a mine owner at Mojave and San Andreas, Cal., is in San Francisco, Cal.

J. R. LUCUS of the Good Hope M. Co. at Phillipsburg, Mont., is visiting at St. Louis, Mo.

T. A. BROWN is in San Francisco from Manvel, San Bernardino Co., Cal., on mining business.

E. M. BARTON of Welser, Idaho, is examining mining property near Winnemucca, Nev.

J. C. MOORMAN, secretary of the Yaqui S. & R. Co., Hermosillo, Mexico, is in Toledo, Ohio.

D. C. ROBBINS of Salt Lake City, Utah, is examining mines at Marysville, Plute county, Utah.

P. S. BATES, publisher Pacific Miner, is in San Francisco, Cal., on his return from the East.

G. MCM. ROSS, a mining superintendent at Virginia City, Nev., is in San Francisco, Cal.

H. W. TURNER, superintendent Cherry Hill mine, near Yreka, Cal., is in San Francisco, Cal.

J. J. MCSORLEY of San Andreas, Calaveras Co., Cal., is in San Francisco on mining business.

T. J. GRIER, superintendent of the Homestake G. M. Co., Lead, S. D., is in New York City.

F. L. MASON is superintendent of the Standard mine at Deadman's Flat, near Nevada City, Cal.

R. A. JACKSON, manager of the Atlin Lake M. Co., is in Vancouver, B. C., from Skaguay, Alaska.

H. L. MILLS of the Wedge mine on Bullion creek, near Marysville, Utah, is in Salt Lake City, Utah.

MANAGER J. T. HODSON has returned to the Lincoln mine at Pearl, Idaho, from Salt Lake City, Utah.

W. L. MOBLEY of North Bloomfield, Nevada county, Cal., is in San Francisco, Cal., on mining business.

A. R. MERRITT of Duluth, Minn., president Success M. Co., operating near Milford, Utah, is in Milford.

H. L. FRANK, owning coal properties at Frank, Alberta, Canada, has gone to Paris, France, on business.

E. W. WILLIAMS of Denver, Colo., operating a group of mines near Idaho Springs, Colo., is in the East.

H. M. RALSTON of Chicago, Ill., vice-president of the Lion G. M. Co., has re-

turned from a visit to their mines on Cherry creek, near Prescott, Ariz.

E. P. JENNEY, superintendent of the Bamberger-De Lamar mill at De Lamar, Nev., is in Salt Lake City, Utah.

ASSISTANT MANAGER S. T. GODBE of Bamberger's De Lamar mines is in Nevada from Salt Lake City, Utah.

W. J. HUPP of Weaverville, Cal., interested in mines in Siskiyou county, is in San Francisco, Cal., on business.

M. F. MURRAY of Salt Lake City, Utah, of the Franklin M. Co., is examining mining property at Marysville, Utah.

SUPERINTENDENT WASSON of the Silver Peak mines, at Silver Peak, Nev., returned last week from Reno, Nev.

W. C. OCHS has returned to Salt Lake City, Utah, after making an examination of mining property at Eureka, Nev.

W. W. KIRBY has returned to Cripple Creek, Colo., from a four months' trip through the East on mining business.

E. W. MUELLER, manager of the Sumpter Smelter Co., Sumpter, Or., is in Seattle, Wash., on a business trip.

M. B. SKINNER, secretary of the J. McCrea Co., Chicago, Ill., is in San Francisco, Cal., on business of his company.

M. W. MATHER, superintendent of the Plumbago mine, south of Alleghany, Sierra county, Cal., is in Oakland, Cal.

L. C. TRENT returned to Salt Lake City, Utah, last week from an examination of mining properties at Pioche, Nev.

J. OBERNDORFER has returned to Salt Lake City, Utah, after an absence of several weeks in the East on mining business.

MANAGER H. S. JOSEPH of the Carls mine at Eureka, Utah, has returned to Salt Lake City, Utah, from Denver, Colo.

H. BROWN of Duluth, Minn., treasurer Success M. Co., operating near Milford, Utah, is in Spokane, Wash., from Milford, Utah.

MANAGER C. W. WHITLEY of the American S. & R. Co. is in Montana on mining business from Salt Lake City, Utah.

J. J. DALY, manager of the Daly-Judge mine at Park City, Utah, returned last week to Salt Lake City, Utah, from California.

J. H. HAMMOND, consulting engineer for Stratton's Independence, Ltd., Cripple Creek, Colo., is examining mines in Mexico.

W. J. SUTHERLAND, formerly superintendent of the Holmes mine, Candelaria, Nev., is in London, England, on mining business.

C. JARVIN AND C. HOFFMAN have returned to San Francisco from an examination of mining properties near Nevada City, Cal.

SUPERINTENDENT G. A. WHITEFORD of the Norwegian mine, near Tuttle town, Tuolumne county, Cal., is in San Francisco, Cal.

C. A. HOLLAND of Carters, Tuolumne county, Cal., superintendent of the Starr King and Altadena mines, is in San Francisco, Cal.

W. B. HOGGATT, manager of the Jualin mine at Berner's Bay, on Lynn canal, below Skagway, Alaska, has returned from a trip East.

H. G. HEFFRON has resigned as manager of the ore purchasing department of the Bingham Con. M. Co., and will go to New Mexico.

MANAGER E. B. KIRBY of the War Eagle and Center Star mines, at Rossland, B. C., is in San Francisco, Cal., on company business.

F. LONGMAID of Oakland, Cal., has been appointed superintendent of the Velardena M. & S. Co., Velardena, Durango, Mexico.

MARTIN J. HELLER, of San Francisco, Cal., is general manager of J. R. De Lamar's mines, near Tucson, Ariz., succeeding H. A. Cohen.

MANAGING DIRECTOR E. O. LEE of the Dexter-Tuscarora of Tuscarora, Nev., has returned to Salt Lake City, Utah, from a visit to the mines.

A. J. MCMILLAN, managing director of the Le Roi and Snowshoe Mining Companies, has arrived in Rossland, B. C., from London, England.

N. GRATZ, manager of the Union Gold Dredging Co., near Centerville, Idaho, returned last week after a two weeks' visit in Boise, Idaho.

J. W. NEILL, superintendent of the metallurgical department for the Tintic M. & D. Co., Yampa smelter, at Bingham,

Utah, returned this week to Salt Lake City, Utah, from a trip East.

A. P. GARRETT of Boise, Idaho, is superintendent of the Nettle L. mine, near Loomis, Okanogan county, Wash., vice B. Crilly, resigned.

W. B. FISHER has resigned as general manager of the American Zinc, Lead & Smelting Co. of Carthage, Mo., and has gone to Colorado Springs, Colo.

A. BURCH of the Cœur d'Alene Development Co. has returned to Seattle, Wash., from a two months' trip through the Southern States and Cuba.

W. H. THOMAS of New York, part owner of the British Columbia C. Co., operating the Mother Lode mine and smelter at Greenwood, B. C., is at Greenwood.

W. MERTON, E. SCHROEDER of New York and L. G. Ronand, of East Orange, N. J., of the Resurrection Mill Co. at Leadville, Colo., are in Leadville, Colo.

E. BRUNKHORST, cyanide and mill man at the North Pole mine, near Sumpter, Or., has gone to Kalama, Wash., to assume management of the Darnell M. & M. Co.

W. H. DUNLAP, manager and superintendent of the Le Compton M. Co., near Nevada City, Cal., returned last week from a business trip to Virginia City, Nev.

S. T. GODBE, A. H. GODBE AND H. A. SMITH returned last week to Salt Lake City, Utah, from Neal district, Idaho, from an examination of mining properties.

D. L. KILLEN, president of the Killen-Warner-Stewart M. Co., at Sumpter, Or., returned last week from a three weeks' business trip to New York and Boston.

PRESIDENT STEVENS of the Siskiyou M. & D. Co. at Yreka, Cal., is managing director vice B. Cardwell resigned, and H. Williams is superintendent of the same company.

J. H. LOBEL, American director of the Societe Belgo-Americaine des Petroles du Wyoming, is in Cheyenne, Wyo., and has assumed charge of their operations in that State.

W. J. SHARWOOD of Berkeley, Cal., leaves on the 20th inst. for Marysville, Mont., where for several years past he has had the superintendency of the cyanide plant at the Drum Lummon mine. He goes to resume operations which are discontinued during the winter months.

Commercial Paragraphs.

THE Tri-Bullion Smelting & Refining Co. of Arizona has opened offices in Chicago at 307 Fort Dearborn Building.

PAWLING & HARNISCHFEGGER of Milwaukee, Wis., wire that the recent fire was confined to one building, in no way incommencing them, and that there is no delay in filling orders.

ADAM SCHILLING SONS, 211-213 Main street, San Francisco, manufacturers of the Golden Gate gas engines, ship this week a 30 H. P. distillate hoisting outfit to the Karma M. Co., near Mohave. It is intended to raise ore from a depth of 500 feet.

THE Elaterite Roofing Co. of San Francisco, Cal., report shipping this week to Hongkong, China, a large consignment of their elaterite flooring material to be used in covering warehouse floors, preventing mold and dampness, as the buildings are erected on the water front.

THE Krogh Mfg. Co., 519 Market St., San Francisco, Cal., has completed four large centrifugal pumps for shipment to Texas, for the irrigation of rice fields; capacity, 50,000 gallons per minute; guaranteed efficiency equivalent to 80%. The pumps weigh thirty tons each.

A FINE LIST of users of cranes and hoists made and sold by Pawling & Harnischfeger, Milwaukee, Wis., shows that representative concerns to the number of nearly 1000 have them in use. The folder, which gives detailed information as to type and capacity, will be sent to any address.

AN examination will be held at San Francisco, Cal., May 6, 1903, for the position of assayer. The appointee must show a broad technical training and wide experience in the work of assaying and metallurgy. Age limit, 20 years or over. Salary, \$2200 per annum. Competitors should apply either to the United States Civil Service Commission, Washington, D. C., or to the secretary of the Consolidated Board of Civil Service Examiners, 301 Jackson St., San Francisco, Cal., for application forms 304 and 375, which

should be properly executed and filed with the Commission at Washington. In applying for this examination the exact title should be used.

THE San Francisco & San Joaquin Coal Co. of San Francisco, Cal., has decided to install machinery for the briquetting of coal dust. The briquetting presses will be driven by electric motors arranged to give any desired speed from 20 R. P. M. to 550 R. P. M. in about fifteen steps. Two 40 H. P., slow speed, 500-volt, direct current motors have recently been purchased for this purpose from the Westinghouse Electric & Mfg. Co., together with speed controlling rheostats designed to vary the speed of the motors within the above limits. The controllers will allow the motors to be operated continuously at any of the speeds.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING APRIL 7, 1903.

- 724,540.—CONVEYOR—H. E. Brett, Los Angeles, Cal.
- 724,661.—FEED WATER HEATER—A. de Bretteville, S. F.
- 724,706.—BOTTLE CRATE—W. E. Brown, Los Angeles, Cal.
- 724,797.—BOTTLE CRATE—W. E. Brown, Los Angeles, Cal.
- 724,429.—MOTOR—A. Brunnelle, No. Yakima, Wash.
- 724,799.—WINDOW CLEANING CHAIR—C. Buckel, S. F.
- 724,991.—TRUCK—F. E. Caton, San Jose, Cal.
- 724,663.—ELEVATOR—M. A. Clennam, S. F.
- 724,443.—BOTTLE—J. M. Culp, Cottagegrove, Or.
- 724,824.—MEAT CHOPPER—R. Dettmer, Oakl. nd, Cal.
- 724,835.—HEN'S NEST—W. J. Dillard, Santa Rosa, Cal.
- 724,678.—NOZZLE—W. A. Dohle, S. F.
- 724,844.—SCHOOL DESK—Gilson & Rowe, Oakland, Cal.
- 724,692.—OIL DISTRIBUTOR—J. B. Glover, Redlands, Cal.
- 724,573.—PILING—Hurling & Bauer, Seattle, Wash.
- 724,531.—QUICKSILVER ROASTER—Johnson & McKay, S. F.
- 724,899.—LOCK—A. W. Livingston, Alameda, Cal.
- 724,905.—TABLE—M. Manfred, Santa Barbara, Cal.
- 725,004.—WHIP—H. F. Moore, Ventura, Cal.
- 724,487.—BATH TUB—A. Moorefield, Stockton, Cal.
- 724,488.—PROPELLER—R. Murr, Seattle, Wash.
- 724,728.—OIL BURNER—E. I. Nichols, S. F.
- 724,933.—GATE—F. L. Price, Hoskins, Or.
- 724,967.—FEED WATER HEATER—C. O. Taylor, Farmington, Wash.
- 724,761.—OIL BURNER—Van Pelt & Laufman, Oakland, Cal.
- 724,527.—VALVE—I. G. Waterman, Santa Barbara, Cal.
- 724,528.—VALVE—I. G. Waterman, Santa Barbara, Cal.
- 724,765.—SPEED GOVERNOR—White & Duryea, Los Angeles, Cal.
- 724,768.—MEASURING APPARATUS—A. C. Wright, Berkeley, Cal.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELEVATOR DRIVING MECHANISM.—No. 724,663. April 7, 1903. M. A. Clennam, of San Francisco, Cal. One-half assigned to Cahill & Hall Elevator Co., of San Francisco, Cal., a corporation. This invention is especially designed to provide a differently acting driving mechanism by which the speed of the apparatus is varied and reversed without change in the direction of rotation of the motors. It consists in a driving mechanism of primary and secondary gears of different diameters coaxial with each other and revolvable about a common axis, a shaft axially in line with said gears and having an eccentric portion, an intermediate gear turnable upon said eccentric portion, said intermediate gear being in mesh with the primary and secondary gears and serving to transmit motion, and an independent driver by which the primary gear may be revolved about its axis. It is especially valuable as applied to elevators, hoists of all descriptions, and in itself provides a sufficient brake to prevent any accident from the running away of the machinery, as the hoisting drum will remain stationary and locked by the gears at any point at which it may be left.

SCHOOL DESK FRAME AND ATTACHMENT THEREFOR.—No. 724,844. April 7, 1903. J. C. Gilson and D. E. Rowe, of Oakland, Cal. This invention consists in the combination with a desk of a plate having means to interlock with the side standard of the desk and having projecting from the outer side of its upper end spaced horizontal and vertical flanges and having on said outer face below said flanges a vertical series of trough-shaped ledges of different lengths cut away at the central portions, and a projecting box-like receptacle on the lower portion of the plate. By means of this invention the pen-holders, pencils, ruler, sponge, etc., of the pupil may be kept always convenient for use.

SAFETY CHAIR FOR WINDOW CLEANING.—No. 724,799. April 7, 1903. C. Buckel, San Francisco, Cal. This invention is especially designed for use where it is necessary for persons to sit or stand outside of the window for cleaning and like purposes. It consists of a light portable frame with means for attaching it to the window sill, so as to project outside, means for securely locking the seat in place, and means for adjusting it with relation to the inclination of the window sill and also with relation to different widths of windows upon which it may be applied.

Latest Market Reports.

SAN FRANCISCO, April 17, 1903.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 49½c, refined (1000 fine); San Francisco, 50c; Mexican dollars, 38 @39c San Francisco, 39c New York.

The present rise in silver is attributable to the purchase by the Government of large amounts for Philippine coinage. Whatever the cause, the slightly increased price is none the less welcome to producers of the metal.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$15.00@15.25; Electrolytic, 1 to 3 casks, \$15.00@15.25; Casting, 1 to 3 casks, \$14.50@14.75; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £63 spot per ton.

The German consumption of foreign copper for January and February, 1903, is here compared, in tons, with the same period of 1902 and 1901:

	1903.	1902.	1901.
Imports	12,504	9,705	11,207
Exports	1,725	1,482	1,398

Consumption 10,779 8,223 9,889

LEAD.—New York, \$4 67½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £13 15s per long ton—2.75c per lb.

SPELTER.—New York, \$5.70; St. Louis, \$4.60; London, £22 10s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$29.65@29.80; San Francisco, ton lots, 3½c; 500 lbs., 32c; 200 lbs., 32½c; less, 33c; bar tin, 3½c, 35c @37½c. London, £135 15s spot.

PLATINUM.—San Francisco, crude, \$18.00 @oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$45.50@46.00; large lots; London, £8 15s; San Francisco, local, \$45.00 @flask of 7½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 3½c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17.15c.

NICKEL.—New York, 50@60c @ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.35; gray forge, \$20.50; San Francisco, bar, 3c @ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c @ set; 14 oz., 40s., 9½c.

CEMENT.—Germania, \$2 50 @ 2.75; Hemmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50@2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 22½c; Astral, 22½c; Star, 22½c; Extra Star, 25½c; Eocene, 24c; Elaine, 27½c; Water White, in bulk, 16c; Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22½c; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50@60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 50@55c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 25@26c @ lb.; carloads, 23@24½c; in tins, 35c; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 2½@2½c @ lb.; caustic soda, in drums, 3@4c @ lb.; Cal. s. soda, bbls., \$1.25@1.50 @ 100 lbs.; sks., \$1.05; chloride of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb tins; borax concentrated, 7@8c @ lb.; roll sulphur, 4@6c; powdered sulphur, 2@3c; flour sulphur, French, 2@3c; alum, \$2.00@2.25; California refined, 2@2½c; sulphide of iron, 9c @ lb.; copper sulphate, 5@7c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66½c, B. 2½c @ lb.; nitric acid, in carboys, 8c @ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @9c per lb.

BONE ASH.—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

BORAX.—Concentrated, 7@9c per lb powdered, 9@12c; fused, 25@30c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c @ lb.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5@7c.

MANGANESE.—Pure, 5c @ lb., 60c.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

SODIUM.—Metal, 3c @ lb., \$1.00.

MERCURY.—Bichloride, 3c @ lb., 90c.

PHOSPHORUS.—(American) 3c @ lb., 75c.

SILVER.—Chloride, 3c @ oz., 90c@1.00; nitrate, 55c.

URANIUM.—Oxide, 3c @ lb., \$3.50.

ZINC.—Metallic, chemically pure, 3c @ lb., 50c; dust, 3c @ lb., 10c; sulphate, 3c @ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the GWIN MINE DEVELOPMENT COMPANY will be held at the offices of the Company, Nos. 1208-11 Claus Spreckels Building, San Francisco, California, on **TUESDAY**, the 26th day of April, 1903, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on **SAURDAY**, the 25th day of April, 1903, at 12 o'clock noon.

J. J. CRAWFORD, Secretary.
Office—No. 1211 Claus Spreckels Building, San Francisco, California.

WANTED.

Metallurgist and Smelter is open for engagement to take charge of copper property. Thoroughly experienced in mining and treating low grade ores. Position preferred in Latin America. At assayer and analyst, age 35, single, excellent references. Address "Cobre," care of Mining and Scientific Press.

SITUATIONS WANTED.

A COMPETENT, PRACTICAL CYANIDE MAN. Assayer and Chemist, with thirteen years' experience, wishes position. Have built two of the largest plants in the U. S. Best of references furnished. Address "Jackson," care of this office.

CHEMIST—YOUNG MAN, UNIVERSITY graduate in chemistry and assaying, some experience, desires position as chemist or assistant with mining, analytical or manufacturing firm. Address "Cinnabar," care of this office.

COMPETENT MILLMAN, MACHINIST AND Chemist. Experience free mill and concentrating. College education. Have built and operated mill in Montana for 13 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. References the best. Address H., care of this office.

CYANIDE, MILL OR AS ASSISTANT GENERAL Superintendent. A thorough chemist and assayer. Technical graduate. Treatment of low grade ores a specialty, also construction. Understand Spanish. Will go anywhere. References A1. Address "Competent," care of this office.

METAL, MINE AND MILL MGR. AND SUPT., open for engagement May 1st; 20 years' western U. S. and Mexican mining and milling experience. Also understands cyaniding and assaying. A1 credentials. Address B, Box 88, El Paso, Tex.

MINING SUPERINTENDENT, FOURTEEN years' successful experience in management of mines, with best of references, desires situation. Address N. F., this office.

WANTED—A POSITION AS HYDRAULIC AND Placer Mining Foreman. Have 20 years' experience. References given if required. Willing to go to Alaska or foreign country. Address F. A. Smith, French Corral, Nevada Co., Cal.

WANTED.

WANTED—MILL TAILINGS, Gold, silver or lead, in New Mexico, Arizona or old Mexico. Will buy or lease. Give location, quantity and value. A. E. VAN VELSAN, Telluride, Colorado. Box 131.

WANTED.

ELECTRICALLY DRIVEN DIAMOND DRILL (Sullivan Drill preferred) with swinging head and pump connected, capable of drilling 300 feet, adapted for underground work, and requiring about 6 H. P., rode ranging from 1 to 5 feet. Apply 235 Crocker Building, San Francisco, Cal.

Wanted—A Superintendent

For foundry, forge, machine and boiler shops employing 20 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answers confidential. Address Z. P. O. box 153, Station C, Los Angeles, Cal.

HELP WANTED.

DRAFTSMEN WANTED AT ONCE.

Structural, \$100 to \$125; Architectural, \$75 to \$100; Steel Car, 75 to 125; Blast Furnace, 75 to 150; Mechanical, 75 to 110; R. R. Construction, 60 to 100; Electrical, 75 to 100; Ornamental Iron, 75 to 110. We have positions open for nearly 300 competent men (Draftsmen, Engineers etc.) to go to work at once. **WRITE TO-DAY.** Engineering Agency, 118 Monadnock Block, Chicago.

COMPRESSORS, ROCK DRILLS, GASOLINE HOISTS

HENRY CAREY BAIRD & CO.,

INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS, 810 Walnut St., Philadelphia, Pa., U. S. A.

Our New and Revised Catalogue of Practical and Scientific Books, 32 pages, 8vo., a Catalogue of Books on Metallurgy, Mining, Prospecting, Mineralogy, Geology, Assaying, Analysis, etc.; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

Three New and Splendid Industrial Books.

JUST READY.

Flemming—Practical Tanning: A Handbook of the Processes, Receipts and Suggestions for the Treatment of Hides, Skins, Pelts and Furs. Description. By Louis A. Flemming, American Tanner. 460 pages, 8vo. Price.....\$4.00

This book is distinctly a new and up-to-date American book. Published April 11, 1903.

Kirk—The Cupola Furnace: A Practical Treatise on the Construction and Management of Foundry Cupolas. By Edward Kirk, Practical Molder and Melter, Consulting Expert in Melting. Illustrated by 73 Engravings. A new and thoroughly revised and enlarged edition. 490 pages, 8vo. Price.....\$3.50

An American book by an expert of established reputation. Published February 16, 1903.

The two books above named will be sent by mail at the publication prices, free of postage, to any address in the world; or by Express C. O. D., freight paid, to any address in the United States.

Van Der Burg—School of Painting for the Imitation of Woods and Marbles: As Taught and Practiced by R. Van Der Burg and P. Van Der Burg, Directors of the Rotterdam Painting Institution. A Complete Practical Treatise on the Art and Craft of Graining and Marbling with the Tools and Appliances needed. Illustrated by 36 Plates. Fourth edition. In one Volume Folio, 12x20 inches. Price.....\$10.00

The above book will be sent by Express, freight paid, to any address in the United States or Canada, at publication price.

This magnificent work comprises not merely the elegant engravings of the finished specimens of Woods and Marbles, but the drawings and the descriptions of the brushes, combs, and other tools needed. It also illustrates the work as it is to be performed by the grainer from the most elementary lines and forms to the completion of the Woods and Marbles which he desires to imitate. Any painter of ordinary intelligence can by the thorough study of the work of Messrs. Van Der Burg make himself a finished grainer. No other volume in the English language on this important subject has ever been published, compares with it in value and elegance.

Elaborate circulars, showing full tables of contents of the above valuable books, will be sent free to any one in any part of the world who will send his address.

HENRY CAREY BAIRD & CO.,

INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS, 810 Walnut St., Philadelphia, Pa., U. S. A.

FOR SALE.

A RARE CHANCE

to buy a complete "Merrill" Mill, as good as new, at a great bargain. Quadruple discharge; three 100-lb. Stamp, complete battery; two sets Screen Frames; Countershaft and Boxes; two Pulleys for same; one triple-compartment Ore Feeder; one set extra Shoes and Dies; all pipe connections; every part in first class order as mill has been used only six weeks; also 8 feet of Amalgamating Copper Plates. Price low—terms spot cash. Inquire of VICTOR MINING CO., Walker, Arizona.

FOR SALE—Cyanide Plant,

Experimental, never used, consisting of 2 8x4 ft. Leaching Tanks (3-16 in) with Filter Bottoms and Filters; 1 Solution Tank 5x6 ft. (No. 12); Zinc Boxes; 10 Zinc Box Screens; 1 Rotary Pump; 1 4 Gal. Iron Mortar with Pest; 1 Rotary Assay Furnace (Hoskins); Pipe, Valves, Ellis, Nipples, Rope, Hose and Clips. Presently stored in Denver. Will sell cheap. Apply JOHN A. NELSON, McPhee Building, Denver, Colorado.

FOR SALE FOR CASH OR WILL BOND.

ONE FULL CLAIM with water right and millsite. Partially developed. Prospects well in free gold. Will stand full investigation. Will deal with principals only.

Address J. M. QUINN, Big Oak Flat, Cal.

From Missouri.

NO. 403. FOR SALE. A thoroughly developed zinc mine in the heart of the Joplin (Mo.) zinc belt. The property is equipped with mill and is now paying unusual profit on price asked. Property can be made to pay 50% net per annum on the investment. Terms cash.

Above statements will be proved to entire satisfaction of investor.

NO. 414. A small block of the treasury stock in one of the largest copper properties on this continent will be placed soon with the Exchange for sale and offered for one day only. Money required to complete reduction works. Complete reports and letters of endorsement by well known mining engineers and mining men in the United States. Full particulars to parties requiring a bona fide investment.

Force of Nitro Powder Explosions.

The question is again being agitated as to the direction of the explosive force of powder, and particularly of nitro powder. The theory generally accepted is that the explosive force is exerted equally in every direction. This is a theory based on rational

with it and it will accomplish the same result. The miner loads "down" holes and "uppers" of given diameter and depth of hole with the same amount of powder, all other conditions being equal, and the rock is broken with approximately similar results. In fact, large experience in blasting operations has not shown that the explosive force of powder, confined or unconfined, is not exerted equally in all directions. It is simply made evident in any particular direction by the resistance it overcomes, but where the resistance is stronger than the force of the powder there is no fracture. Often in mines the base

the hardness and the tenacity of the rock is superior to the explosive force of the powder, which has expended its force without material result. In such instances the collar of the hole is first blown off, and successive charges fracture the rock until it is finally rendered incapable of further resisting the explosive force, when the rock is blasted out. The tendency of this explosive force in powder, as exemplified in blasting operations, is to break rock at an angle of 90° to the direction of the drill hole, but it often fails to do this, owing to conditions of resistance within the rock. Learning this by experience, the miner selects the point to start the drill hole, and gives it a direction calculated to insure the best results.

Gravity Tramway and Mill, Cherry Hill Mine, Siskiyou County, Cal. (See Page 262.)

Entrance Cross-Cut Tunnel, Cherry Hill Mine, Siskiyou County, Cal. (See Page 262.)

conclusions. It would seem impossible that it could be otherwise, but actual practice should give the best idea of this. It has long been known that a stick, or portion of a stick, of nitro powder placed on the top of a rock or boulder will break the rock into fragments if the amount of powder is large enough. The downward force of the explosion is evidenced in the breaking of the rock, but the upward explosive force is not shown, as it is wasted upon the air where there is the least resistance. Place the stick beneath the rock and in immediate contact

of a drill hole that has been exploded with nitro powder is found to contain a mass of powdered rock but no fracture has resulted beyond the bottom of the hole, although all of the rock, from the bottom of the hole outward, has been blasted away. The force in this case has been exerted equally in all directions, but was incapable of breaking beyond the limits of the drill hole. It is not an uncommon thing to see a drill hole driven directly into a face of hard rock for 5 or 6 feet, loaded with nitro powder, and fired repeatedly before the rock is broken, for the reason that

Each hand-drilled hole is put in with definite purpose, to accomplish some certain result.

Machine drill holes are put in with almost systematic precision, dependence being placed on general results rather than distribution of the holes with reference to their particular capacity to break rock. For this reason hand work is sometimes to be preferred to machine drilling, and in shaft work is often superior. A knowledge of blasting and of the effect of the explosive force of nitro powder can best be attained by practical experience.

Age of Gold in Mines.

A quasi-scientific article entitled "The Age of the Homestake Lode, South Dakota," which recently appeared in a current publication, is subject to criticism, as it contains statements not sustained by actual facts. Dr. F. R. Carpenter, in his paper "Ore Deposits of the Black Hills of Dakota," is correct when he says "the conglomerate being gold-bearing, absolutely proves the gold in the Homestake mines to be of Archæan age."

It is not always possible to determine, even approximately, the geological age of the gold found in mines, as the time is at best only relative, being determined by a comparison of geological conditions with some other formation or locality. The formation of some veins and the introduction of their metallic contents in many instances, however, can be definitely determined to the extent, at least, of fixing their age as not being older than a stated time. The veins of Cripple Creek, Colo., although occurring in both granite and andesite, are known to be of comparatively late formation, probably later than the Cretaceous. The ore deposits of Leadville, Colo., are so intimately associated with the intrusive rocks of that region that it is believed they originated subsequent to the intrusion of these rocks which occurred about the close of the Cretaceous, though the limestones are of Carboniferous and the lower quartzites of Cambrian age.

The gold-bearing veins of the California gold belt are not older than the Jurassic, as they occur in rocks of that age, but are probably of Cretaceous age. The silver deposits of Calico district, Cal., are probably of Tertiary age, as the Tertiary beds of the vicinity were raised by the uplift of the older rhyolite tuffs and breccias at the time of the intrusion of rhyolite dikes, and the general dynamic disturbance which fractured the rock masses and resulted in the formation of zones of crushing, open fissures, etc., which were subsequently filled by infiltrations chiefly of baryta with silver (presumably as sulphide, but which was later changed to chloride).

The gold in the gold-bearing veins (not blanket de-

posits) of the Black Hills of South Dakota are undoubtedly for the most part of Archæan age. Throughout the area of the older crystalline rocks in the Hills determined as Archæan, or, at all events, not later than Algonkian, gold occurs in veins, or as lenses in the schists. In many instances gold is not present in payable quantity, but it is there in appreciable amount. It is not improbable that some of the gold may have been introduced in later time than Archæan, but there are several localities where there is indisputable evidence that the gold in the Archæan rocks is older than the Cambrian. About Lead City and Central City and at Terraville this is clearly shown in the fact that the Cambrian conglomerate, which immediately overlies the upturned Archæan schists, in which the mines of the Homestake group chiefly occur, is auriferous—in fact, an ancient placer deposit, formed by the disintegration of the upturned edges of the schists together with their contained gold, and the deposition of the resulting water-worn pebbles, together with the smooth flakes and nuggets of gold abraded by the shifting currents and wave action on the shore of a Cambrian sea. In the Hidden Treasure mine at Central City, in 1877-78, it was no uncommon thing to see pieces of this conglomerate torn up from the bedrock (Archæan schist) by the picks of the miners, exposing from \$20 to \$100 or more in gold in the form of placer nuggets, adhering to the slab of cemented gravel. As it is impossible to have a placer mine without an older deposit of gold as a source of the gold in the placer, and as the gold-bearing conglomerate was undoubtedly a placer deposit on the Cambrian shore, it proves conclusively that the Archæan schists were gold-bearing in pre-Cambrian time.

The schists of this region are intruded in many places by dikes of light colored igneous rock which has been variously described by different petrographers as "felsite," "rhyolite," "grorudite," etc. The rock is usually fine grained, light ashy gray in color, with a slightly greenish cast, and on close examination with magnifying glass may be seen to contain finely disseminated iron sulphide. This rock is abundant in the Homestake, Highland, Caledonia and some of the other mines of the Homestake group, and is intimately associated with the ore bodies. That this rock had an enriching effect upon the ore bodies seems not improbable, but it is a notable fact that no fragments of this intrusive rock have ever been found in the bed of conglomerate overlying the Homestake mine or in its vicinity, which proves conclusively that the intrusion of the dike rock was later than the Cambrian. The northern Black Hills has been extensively intruded by dike rocks, and these in many instances have formed laccoliths, often local in extent, but perfect in form. They may be seen on Two-Bit gulch and Spruce gulch, east of Deadwood, and in the region south of Lead City, near Ruby basin; also on Squaw creek, west of Deadwood; near Boulder creek, north of Deadwood, and in the Terry peak region on a large scale. The intrusive rocks in and about the Homestake mine also formed laccoliths of considerable size, and it is this type of intrusion in connection with the later intrusive dikes that resulted in the formation of the extensive deposits of siliceous telluride ores in the regions extending from Galena on the east to Spearfish canyon on the west, and from the Homestake on the north to Terry's peak and Whitewood Divide on the south, but the age of these latter deposits is believed to be not older than the close of the Cretaceous. They have nothing in common with the Archæan zones of gold-bearing rock, are different in character, genesis and value.

DURING the past week there had been a hope that the miners' strike in Amador and Calaveras counties, Cal., would be settled, as there seemed to be a conciliatory disposition manifested on both sides. The executive committee of the Mine Operators' Association have proposed the following: Employees may return to work, union and non-union, and no discrimination against either. Where the time of the underground shift is now ten working hours, the same shall be reduced to nine working hours with the same rate of wages. The union is not to be recognized. To this the mine operators agreed, and miners at the Gwin mine also agreed, but Amador miners now ask for eight hours, declining to accept nine hours.

Character of Hoisting Plants.

When about to place a hoisting engine at a mine shaft there are a number of important factors which should be considered. First, the amount of material to be handled daily, the depth from which it is to be hoisted, the size and weight of the carrier—skip, car or bucket—and speed necessary to make a given number of trips with a stated load. Thus with a necessary output of 600 tons daily from a depth of 1000 feet, presuming skips are used, with capacity of two tons, in two-compartment shaft, running in balance. To hoist 600 tons at the rate of two tons per load would require 300 trips. If a skip can make the trip from the 1000 level to the surface in one minute, dump and return to the 1000 level and be filled in one minute and a half, this would require two and one-half minutes to make a round trip, but as the skip in the opposite compartment is supposed to be carrying ore at the same time, this results in the delivery of two tons at the surface, on an average each seventy-five seconds, or 300 loads in 6.25 hours. This permits all hoisting of ore to be done in the day time, and also allows abundant time for handling men, machines and materials, beside permitting the handling of all waste and extra work, water hoisting, etc., to be done on night shift.

In figuring horse power of engines required to do work as outlined, not only speed of hoisting and load of ore must be counted, but also weight of skip, maximum weight of rope and necessary allowance for frictional and other losses must be taken into consideration. Presuming that the skip weighs 2000 pounds, 1000 feet of 1½-inch rope weighs 2000 pounds, and the load of ore weighs 4000 pounds, this makes a gross load of 8000 pounds to be hoisted 1000 feet in one minute. The counterbalance of the empty skip descending in the opposite compartment, weighing 2000 pounds, decreases this maximum load to about 6000 pounds, but from the time of starting the relative loads are never constant, as while the empty skip descends the shaft, the weight of the rope constantly increases until at the 1000-foot level when the loaded skip has reached the surface weighing gross 6000 pounds, the empty skip has reached the bottom of the lift, and represents a counterweight of 4000 pounds. The hoisting engine must be capable, however, of starting the maximum load of 6000 pounds and lifting it at the rate of 1000 feet per minute, or 6,000,000 foot-pounds per minute. The theoretical power required would be about 181 H. P., but there are numerous factors to be considered in this connection. These are loss of efficiency in the engine (that is the difference between the indicated horse power and the actual horse power developed in the cylinders), the friction of the drum or reel, and sheave bearings; the stress of the rope, winding on the drum, and on the sheave in the head frame; the friction of the guides in the shaft and the resistance from air, which factor is seldom given the consideration it merits, as it is considerable and increases directly as the speed of running. All of these factors are variable and in well appointed plants are reduced as far as possible, by lubrication, and careful setting of machinery and proper construction, but a factor of 25% is always necessary, and in the case of inclined shafts, or where the difficulties and disadvantages are multiplied, a larger factor must be provided.

There is a tendency to economize on first cost, and in many instances, after an expensive hoisting plant has been installed to perform given service, as in the example given above, within a short time the engine is called upon to perform far more than was originally planned. This is done by increasing the load or the speed, or both, and carrying the mine workings to greater depth, and still demanding that the engine give the same service as was originally calculated. As in many instances the development and operation of the mine are carried beyond the original plans or expectations, the necessary provision should be made when first installing the permanent plant, for it is more economical to put in a plant which in first cost shall cover all probable extensions and exigencies than to build two such plants. It is not advisable to put in a large and costly hoisting plant for shaft sinking, as the amount of material to be removed in any case will not exceed 120 tons per day, and in most cases does not reach half of this amount. The extreme case does not require more than fifteen tons to be hoisted per hour during an eight-hour shift.

CONCENTRATES.

THE average declared value of imported cyanide of potassium the past year was 19½ cents per pound. About 2,500,000 pounds are annually imported. The duty is 12½% ad valorem.

THE amount of stripping economically possible in a gravel, drift or quartz mine depends entirely upon the value of the gravel or ore to be removed subsequent to stripping. In placer mines alluvial may often be cheaply removed by ground sluicing.

DOUBLE DISCHARGE MORTARS give large crushing capacity, but are not suited to an ore which requires amalgamation in the battery. They are chiefly employed in crushing ores for concentration, or for treatment by wet silver processes, as lixiviation, etc.

THERE are no extralateral rights in Mexican mines. The mineral rights of miners are defined by the boundary planes extended downward vertically to the center of the earth. Veins outcropping on adjacent claims which pass beneath the surface of an adjoining claim cease to be the property of the owner of the outcrop claim.

WHAT would constitute pay gravel in one district may not be considered equally good in another locality where the conditions were different. The character and depth of the gravel, amount of water available, or to contend with, grade of bedrock, rate of wages and cost of lumber; all have an important bearing on the economics of the enterprise.

HOISTING engines in very deep mines in a few instances run at a speed of 6000 feet per minute, but the ordinary speed is 1000 to 3000 feet per minute in most deep mines. In all of these large deep shafts the loads are heavy, ranging from two to ten tons. Such high speeds are only safely attainable in shafts 2000 feet or more in depth.

SPLIT spiling or lagging are generally considered superior to 2-inch plank, both for strength and durability. Sap lagging, however, is inferior to good plank. In shaft work, where it is not necessary to "drive" lagging, plank is preferred to the split lagging, and is more easily placed. In very loose ground double lagging is sometimes used.

A ROCKER may be made in sections for transportation on animals, sleds, or the backs of men. The sides, bottom and back end may be held securely in place by means of light iron (½-inch) bolts. A rocker of this description costs little more than one of the ordinary kind. Many thousands of dollars have been washed out in rockers made from shoe boxes.

THE mixing of low-grade ore, which in itself will not pay for metallurgical treatment, with high-grade ore to obtain large quantity should not be done, as the result is an actual loss of profit, which would result from a treatment of the high-grade ore alone. This is something that miners may sometimes do to get a "fair average," but in so doing deceive themselves.

THE hydraulic ram is a device employed where there is a considerable flow of water with a moderate fall, which by the use of the ram can be made to force a relatively small amount of water to a height greater than the fall. Rams are often used under the conditions stated to raise water to tanks for hoiler or domestic use where a large amount is not necessary.

MINERAL VEINS and mineralized zones usually occur most abundantly in those regions which have been subjected to the greatest disturbance. When ore deposits occur in sedimentary rocks which have apparently not been so disturbed, investigation usually results in the discovery of fractures, fissures and often the occurrence of intrusive dikes, the presence of which is not discernible upon superficial examination.

SOFT ground in a mine that upon becoming wet "runs," may best be handled by draining the water from the workings and keeping the level as dry as possible for a time before attempting to remove the ore, or to carry on development in the vein. When thoroughly drained, veins of this character are often worked without great difficulty, when an attempt to work them without previously allowing the ground to drain would be very difficult and expensive, if not impossible.

THE LAW requires the discovery of "mineral in place" to perfect a location, but this does not prohibit one from taking a claim and beginning work thereon in search of mineral. It is not necessary that the rock found shall be payable ore. "Mineral-bearing rock in place" are the words of the statute. A claim may be located and held on rock containing a fraction of a dollar per ton as well as on that which contains hundreds of dollars. The poor prospect may prove to be a bonanza upon development.

THE steam stamp has been employed successfully in amalgamation, but it is not in general use. The height

and rapidity of drop seem to have a direct influence on the percentage of amalgamation in the battery. A much more rapid drop is possible with a steam stamp than with the ordinary gravity drop stamp. With the latter 110 drops per minute is about the limit of speed that can be attained with safety and this can only be accomplished with short drop and short cams. A higher speed results in the tappet striking the cam.

THE United States production of molybdenum has risen from 10,000 pounds in 1898 to about 250,000 pounds in 1902. Consumption and production about keep pace. Molybdenite should contain 60% molybdenum to be marketable, and should be fairly free from phosphorus or copper. Its present greatest commercial importance is in manufacture of steel. The ore is quoted at prices corresponding to its shipping grade. The South Bethlehem Steel Co., South Bethlehem, Pa., are buyers. The process of reduction has been repeatedly published herein.

THE presence of tellurium in ores, when suspected, may be determined by boiling in concentrated sulphuric acid; when, if tellurium be present, a purple violet color appears, which fades upon further boiling. The color will be more or less intense, depending on the amount of tellurium present. Tellurium heated before the blow-pipe on charcoal gives a white coating with red or yellow border. If the fumes arising from the coal be caught on a porcelain dish the application of sulphuric acid will cause the grayish or brownish film to assume a crimson color.

AS a conductor of electricity, silver is superior to copper, the ratio being silver 1000, copper 931. Aluminum also possesses high conductivity, but to carry a given amount of electricity it should have a sectional area at least double that of copper. The melting point of copper is placed for convenience at 2000° F., which it approximates. It is impossible to fix exactly the melting point of substances requiring so high a degree of heat. When copper is heated to within 200° or 300° of its melting point it becomes very brittle, breaking readily, and may even be pulverized.

THE peculiar excellence of Lake Superior copper is due to melting the metal obtained directly from the ores by concentration where it occurs almost exclusively in the native state. This has resulted in placing a very high standard on American copper, and the metal when obtained by the various processes from other than those containing the native metal must be refined to a high degree to compete with Lake copper. The best fuel for refining copper is wood, owing to its freedom from sulphur and other impurities, which would have a deleterious effect on the metal.

LARGE GOLD MILLS having a double row of batteries are constructed usually with the batteries back to back, the overhead ore bins being arranged along the center of the mill. Very few mills are built on a different plan. The original 100-stamp mill at the Father De Smet mine at Central City, S. D., one of the Homestake group, had two rows of batteries facing each other, the bins being arranged along the center of the mill and sloping to the sides. It gave large bin capacity, but made a dark mill. It is an arrangement not in general favor. A well lighted mill is always desirable.

BY pyritic smelting is meant the complete fusion of sulphide ores by means of the heat generated by their own oxidation, and without the aid or addition of extraneous heat, such as carbonaceous fuel or the employment of the electric arc. The collection of the precious metals by employment of the sulphides is properly matte smelting, where no use is intentionally made of the heat generated by the oxidation of the sulphides. In pyritic smelting, as now practiced in successful plants, a hot blast is employed, which is really an extraneous heat. The hot blast is said to produce a beneficial effect in smelting which is greatly out of proportion to the heat units it supplies to the operation of the furnace.

FOR HOISTING from great depths round, tapering ropes have been used both in Europe and America. On the Comstock one was in use in 1875 hoisting from an incline at 37° 1400 feet, through a vertical shaft 1400 feet deep, the hoisting engine being located on the surface. In Germany taper ropes were in use at the mines of Pzibram, hoisting from a vertical depth of 3900 feet. They were made of crucible steel, having a maximum breaking strain of sixty tons, and had a regular taper. A single wire was cut about each 16 feet and a larger wire welded on (by brazing). Each rope comprised seven strands around a hemp center, and each strand contained six wires around a hemp core. This rope lasted over three years.

SUBSTANCES which have been held by the Land Department to fall within the designation of mineral as applied to mineral lands subject to location on the public domain are asphaltum, petroleum and the mineral hydrocarbons, borax and borax-bearing minerals, nitrate and carbonate of soda, sulphur, alum, clay, kaolin, mica, umher, gypsum, limestone, granite, marble, diamonds, phosphates, building stones, and stones of special commercial values, as corundum, turquoise, tourmalines, etc., coal and slate for roofing. Salt is also classed as mineral, but salt lands are held to be reserved from railroad grants, nor are they subject to disposal under the

mining laws. Land may be determined and classified a mineral when the substances it contains is recognized as mineral according to its chemical composition by standard authorities on the subject, or it is classified as a mineral product in commercial trade, or where there occurs in the land mineral substances which possess economic value for use in trade, manufacture, the sciences, or in the mechanical or ornamental arts, and when substances of the nature stated occur in such abundance in the land as to make it more valuable for mineral than for agricultural or other purposes.

ALL valuable mineral deposits on the public lands of the United States, both surveyed and unsurveyed, are free and open to exploration, purchase and occupation, by citizens of the United States, and to those who have declared their intention to become such, under the regulations prescribed by law and according to the local customs or rules of miners in the several mining districts, so far as the same are applicable and not inconsistent with the laws of the United States. The limit of maximum length of a claim is 1500 feet along the vein, and the maximum width 300 feet on each side of the center of the vein. No local law or regulation shall limit the width of a claim to less than 25 feet on either side of the center of the vein at the surface.

IN dry-crushing stamp mills, wooden wedges are not suited to securing the stamp in the bosshead, as the stamp becomes heated by impact, the wedges dry out or become charred and allow the stamp head to drop out. Thin metal strips are employed for this purpose. For expediting the fixing of stamp shoes in bossheads in wet-crushing mills, the wooden wedges may be tacked to strips of drilling. These may be quickly wrapped around the shoe shank, and the stem and bosshead allowed to fall upon it in the usual way. When stems or shoes cannot be driven out of a bosshead by means of wedge and hammer, small pieces of nitro powder will usually have the desired effect, but an overcharge is likely to burst the bosshead; consequently good judgment is required in its use.

THE phenomena of electric discharges in vacuum tubes give the nearest approach to seeing electricity that are likely to be made. The streams of corpuscles propelled along the tubes suggested to Crookes in 1870 the idea of a fourth state of matter, and these corpuscles—smaller than atoms and the same in all kinds of gases—were named electrons by Stoney, and have come to be regarded as the electric parts of all atoms, or even as making up matter itself. When torn from its groups or from matter, the electron travels with a speed comparable to that of light. A body charged with electricity, if at rest, presents the phenomena of electrostatics; if in motion, those of electricity and magnetism; if in acceleration or change of motion, those of light and radiation generally. Some substances—such as uranium, polonium and radium—throw off electrons without stimulus, giving intense and penetrating rays, with a kind of "electrical evaporation." This property of radio-activity is found in many bodies, even in leaves and newly fallen raindrops, and it will soon be difficult to find any substance without it in some degree. On the hypothesis that matter is composed of electrons, their size is known to be about the hundred-thousandth part of the diameter of the atom. In an atom of hydrogen there are about 1000 electrons, in an atom of mercury there are 100,000; but even in the latter they are shown by calculation to be about as far apart in proportion to their size, comparatively, as the planets in the solar system. By their force the atoms come to be impenetrable. Of the fundamental properties of matter, inertia is considered to be electrical, cohesion is being shown to be so; gravitation is still a mystery.

COAL LANDS may be entered at the proper United States land office by individuals or associations of persons. In the case of an individual he must be above the age of twenty-one years and a citizen of the United States, or must have declared his intention to become such. In an association of persons each one must possess the requisite qualifications. The right to purchase coal lands can be exercised but once. All locations must be made on the public (unoccupied) surveyed lands of the United States, and must conform to the lines of survey. A single individual cannot take more than 160 acres of coal land, nor a corporation or association more than 320 acres. Tracts applied for must be contiguous. The applicant must file with the register of the proper land office a verified application describing the lands sought to be purchased, his qualification under the law to make the entry, etc. If the tract is clear the price is fixed, depending on the situation of the lands in reference to a completed railroad—if within 15 miles of a railroad, at \$20 per acre; if more than 15 miles from a railroad, at \$10 per acre. The applicant must be in actual possession of the lands he has applied for, and he must, prior to final entry, have opened and improved the mines situated thereon. The claimant must within sixty days of assuming actual possession of the land present at the land office his declaratory statement of facts. Failure to provide this instrument within the time specified renders the land subject to entry by another. Final proofs must be made and the land paid for within one year from the time of filing respective claims. Within this time—one year from time of making declaratory statement—claimant must make his application to purchase, and submit proof showing compliance with the law.

Copper Production on Lake Superior.

Final figures of production of refined copper by Lake Superior mines in 1902 are now all in, except for the Trimountain, and in that case the estimate of 6,000,000 pounds is based on an unofficial but direct estimate of the company. The figures for 1901 will be found to differ materially from the generally accepted statistics, but those given herewith are believed to be accurate. The erroneous figures in general circulation are due mainly to errors in the statement of output of the Calumet & Hecla, caused by the fiscal year of that corporation ending on April 30. The following figures are for production during the calendar years in each case:

Mine—	1902.	1901.	1900.
Calumet & Hecla....	81,248,739	82,519,676	77,761,382
Quincy.....	18,988,491	20,540,720	14,116,551
Tamarack.....	15,961,528	18,000,852	19,182,502
Oseola.....	13,416,396	13,723,487	12,566,471
Wolverine.....	6,473,181	4,946,126	4,789,829
Baltic.....	6,285,819	2,641,432	1,735,060
Trimountain.....	6,000,000
Franklin.....	5,259,140	3,757,419	3,663,710
Atlantic.....	4,949,366	4,666,880	4,930,149
Champion.....	4,165,784
Isle Royale.....	3,569,748	2,171,955
Mass.....	2,345,805	950,000	122,239
Adventure.....	806,211	29,361	23,572
Arcadian.....	600,000	500,000	1,350,000
Mohawk.....	226,824	160,890
Michigan.....	133,373	33,601
Winona.....	101,188
Centennial.....	806,400	892,500
Arnold.....	108,000	856,000
Phoenix.....	93,643	88,206
Miscellaneous.....	500,000	50,000	73,400
Totals.....	170,831,593	155,716,848	142,151,571

These figures show a gain of practically 10% for each of the two preceding years. For 1903 the increase will be more than 15%, and possibly 20%. The increased production secured in 1901 and 1902 were practically the first increases for five years and reflect the increased productive capacity of the district, brought about by the opening of new mines rather than any marked increase in the output of the older mines. The actual production of the new mines was a trifle more than 5,000,000 pounds in 1901, and upwards of 20,000,000 pounds for 1902, and should be doubled during the present year.

The output of the Calumet & Hecla was practically the same in 1902 as in the preceding year, and the mine is now producing at practically the same rate, of about 7,000,000 pounds of refined copper monthly. The new 6-stamp mill of the Calumet & Hecla, now going into commission, will not increase production for some time to come, as the old mill is to be rebuilt in sections as soon as the new stamps begin duty. Eventually this will give the property materially increased stamping capacity. It is not certain, however, that it would be wise to crowd the mine much above the present production, which is approximately 6000 tons of rock daily. If the amygdaloid mine on the Oseola lode is worked, as may be done if copper holds at a good price, the Calumet & Hecla can closely crowd an annual output of 100,000,000 pounds, or at the present rate of production of the Anaconda (now, and for some years past, the world's largest producer of copper). The outputs of the Calumet & Hecla and Rio Tinto of Spain have been practically the same for several years past.

The Quincy shows a slight falling off from the preceding year. This was due to the mining and stamping of rock of much lower average grade than formerly. In order to feed the stamps about 3400 tons of rock are supplied to the mills daily, and it is impossible to furnish such a large tonnage of as high grade as obtained formerly, when but a third to a half of this output was required. The Quincy is now one of the best equipped mines in the world, and should be able to maintain an annual output of approximately 20,000,000 pounds of refined metal for some years.

The Tamarack showed a marked decrease in 1902. The three deep shafts have thus far proven somewhat disappointing and the grade of rock stamped has declined for some years, even though the bulk of the Tamarack production is from the Calumet conglomerate. The expense and strain of operating a mine 1 mile in depth may be guessed at, but can be fully understood only by those in actual charge. However, the Tamarack will be a big mine and a large producer for a long time to come.

The Oseola output for 1902 was but a trifle less than in the preceding year, contrary to the general expectation of a large decrease. The mines and mills are again working full forces, and the Oseola should show an output of 20,000,000 to 25,000,000 pounds this year.

Wolverine, which has shown an increased output during every year of its life, made a large gain in 1902, and is expected to make a still larger gain during the current year, probably 10,000,000 pounds, placing the Wolverine among the largest producers. The Wolverine is making the cheapest copper of any Lake Superior mine.

Trimountain is the largest producer of 1902 among the new mines. An output of 6,000,000 pounds for its first year of production looks large, but the 1903 figures are expected to exceed this. The Champion,

which adjoins the Trimountain, is working the same lode. The Champion's output of over 4,000,000 pounds will also look small when the figures for this year are given out. The recent tempest in a teapot on the floor of the New York Metal Exchange about the presence of arsenic in the copper of the Champion, Trimountain and Baltic mines appears ridiculous to those conversant with the copper trade. The existence of an unusually large percentage of arsenic in the refined copper from the "south range" mines has been known in copper circles since the Baltic began production. Few of the Lake mines, at depth, are as free from arsenic as was the case twenty or even ten years ago. For certain uses arsenic is deleterious, while for other purposes it is an advantage. More and more of the Lake copper is being refined electrolytically, and in time all but a few special brands will go through the tanks. The 1902 output of the Baltic exceeded 6,000,000 pounds and will show another gain this season. The Franklin exceeded 5,000,000 pounds output for the first time in its history, and made a record of output and costs from a refractory lode that has formerly been worked at a loss. Atlantic held its own and a trifle more. At present the showing is more encouraging at this property than for some time past. The Atlantic is a good example of successful work on an extremely low-grade ore body.

Isle Royale's showing for 1902, considering that it was worked under check for the greater part of the time, was good. The mine is not rich, but it is well equipped. The only possibility of dividends lies in working the mine on a large scale, which is not being done at present.

The output of the Mass mine showed material gain in 1902, though not as large as had been anticipated. The Mass needs further development before it can supply its stamp mill to advantage. The Adventure's mill was started in the fall of 1902 and the production of 606,211 pounds was disappointing. The mine is not capable of supplying the mill with selected rock to its full capacity and is now running under check. The Mohawk mill was started so late in the year that the 1902 production was trivial. For the current year the Mohawk should make nearly 8,000,000 pounds, and with the third stamp in commission will be able to increase it. Eventually the Mohawk will increase its milling capacity to four stamps, which will handle nearly 2000 tons of rock daily.

The small output of the Michigan was secured exclusively from heavy copper taken out of shafts, drifts and crosscuts in the work of opening. None of the stamp rock so secured was treated, and no copper removed except where necessary to make room for the passage of mine openings. The Arcadian is running only one stamp part time on its own rock, the other heads being leased to the Trimountain. The output for 1902 was larger than that of the preceding year. Winona's output of 101,188 pounds refined copper was secured from rock stamped under one head of the Atlantic mill in the last few weeks of the year. This stamp is still running on Winona rock and is securing about 1% copper.

The Centennial was out of the running in 1902, but has opened some fine ground in its new shafts on the Kearsarge lode, and should become a producer again in the near future. The Phoenix will have one stamp running next summer. The Arnold is closed down, with no likelihood of an early resumption.

Houghton, April 18.

HORACE J. STEVENS.

[In comparison with the above, following is given as the output of the Rio Tinto mines of Spain for the past three years: In 1900 there were produced 71,464,000 pounds; in 1901 the output was 70,696,000 pounds, and in 1902 it fell to 68,956,000 pounds.—Ed.]

Topographic Mapping of Arizona, 1903.

Plans have been completed for securing vertical and horizontal control for an area of about 3000 square miles in southern Arizona, and two parties have been sent to the field by the United States Geological Survey.

A triangulation party, in charge of T. M. Bannon, has commenced work near Florence on the Gila river, Pinal county, and is working southward, intending eventually to close work on the international boundary line in the vicinity of Nogales, Santa Cruz county.

A second party, in charge of M. S. Bright, will determine the elevations for the area, commencing at one of the bench marks on the Mexican boundary line and running accurate spirit level lines northward through Santa Cruz, Pima and Pinal counties to close on bench marks previously established in the vicinity of Florence and Riverside. Iron posts will be placed at intervals of from 3 to 5 miles along the lines on which elevations above sea level will be indicated.

H. H. Hodgeson will act as topographer with the level party, and will make a contour sketch of the lines leveled over. He will also make careful examinations and sketches of all possible reservoir sites that may be discovered. This work is but preliminary to the topographic mapping of an area of about 2000 square miles, which will be commenced next fall

and finished during the winter. The survey is designed to aid in the development of the irrigation, timber and mining interests of the country mapped.

The Picacho Basin Mines.*

About 25 miles north of the town of Yuma, Ariz., in San Diego county, Cal., is a high tower-shaped eminence called Picacho, or peak. It rises 1500 feet above the Colorado river and is the most prominent landmark in that region of fantastically sculptured hills. The Picacho is made up of a series of rhyolitic and andesitic rocks, representing a long period of volcanic eruption. There are rhyolites and liparites, hornblende and augite andesites, tuffs and breccias, and more recently basalts, in the region, which, excepting down in the valley bordering the Colorado river, is a typical desert, where rain seldom falls and where the range of temperature is wide, that of summer being particularly high.

Out of the vast field of volcanic rocks erosion has carved the rugged hills, with their sharp, clear-cut outlines, removing most of the volcanic rock and exposing the underlying older crystalline rocks. The Picacho is but a remnant of the lava deposit, which must have at one time had a thickness approximating 2000 feet. The peak has suggested the name of the mining district, which covers 40 square miles of the adjacent territory. The older rocks, exposed in the low, rolling hills in the Picacho basin, extending several miles along and back from the Colorado river, are micaceous and hornblende schists, with a few intrusive dikes, mostly diorite and granite (pegmatite). Over a large part of the region adjacent to the Picacho there is a deposit of auriferous gravel. To the eastward the rocks have a greater variety and are intruded by many dikes, large and small. This section is known as the White Gold basin, from the fact that the gold occurring in the veins here is alloyed with silver to such an extent as to give the metal a light color. The rocks here are mica and hornblende schist, diorite, granulate, cherts, and felsitic eruptives. There has been much metamorphism, and there are gold-bearing veins or zones of large size coursing in nearly parallel directions. These are five in number and are from 20 feet to over 100 feet in width. The rocks are greatly fractured and crushed, and have been extensively mineralized by the infiltration of silica and iron sulphide, which upon oxidation has left a porous siliceous mass, colored red, yellow or brown by iron oxides. This rock or ore contains gold and silver and is the source of the dry placers that for years have been worked by the Mexicans and Indians in a primitive way—by wind-tossing; panning, when there was rain water available, and more recently by dry-washing machines. Some prospecting has been done on these large zones of low-grade ore, but no systematic development has been undertaken.

In the region adjacent to the Picacho, however, the California King G. M. Co. have carried on extensive development in zones of gold-bearing rock which appears to be the result of mineralization of crushed masses of the country rock, into which silica and gold have been infiltrated and deposited. Here, however, the gold is high grade and the silver is present in relatively small quantity. There are numerous white quartz veins traversing the rocks of this portion of the district, but for the most part these are not gold bearing, or only slightly so. The principal development is about 4½ miles back from the Colorado river.

The accompanying engraving illustrates the appearance of this desert basin with the rugged topography of the surrounding hills, which are all of volcanic origin. The ore is mined by open cut method and sent by railroad to the company's mill, located on the Colorado river.

The gold-bearing gravel of this basin has been worked in a primitive way by Mexicans, in the same manner as that to the eastward, but about twelve years ago a company was organized to operate these dry placers by hydraulic method, pumping the water from the river. A large pumping plant was installed and a pipe line 5 miles in length laid to the gravel beds, situated near the present site of the company's mines. This plant cost nearly \$500,000. The engraving illustrates the site of the pumping plant now dismantled. At the head of the pipe line was constructed a circular stove tank, built upon a frame, similar to railroad water tanks, and having a capacity of perhaps 3000 gallons. When all was in readiness and the pumps were started it was found that they did not possess sufficient capacity nor power to lift the water to the tank, to say nothing of hydraulicking under pressure. It was one of the most absurd engineering feats ever undertaken in the West, not hut that hydraulicking may successfully be accomplished in the manner indicated, but under the existing conditions a very large factor for loss in head had to be reckoned with and met. The friction in a 12-inch pipe line 5 miles in length would result in a great loss of head and consequently of power, and as the water had to be lifted a vertical height of 500 feet, it can be seen that to deliver 750 cubic feet of water per minute, or 500 miner's inches—which amount would be necessary to make operations a success mechanically—these conditions would require a very large plant.

* See illustrations on front page.

Hints on Leather Belting.

Written for the MINING AND SCIENTIFIC PRESS by
W. H. KRITZER.

The destruction of machinery, broken pulleys, hot boxes, belts, etc., is a common experience which in

nected to each other by belts, it is not easy to give a definite rule as to what distance to have them separated further than to have them far enough apart to allow of a gentle sag when the belt is in motion, being cautious not to have too great a distance, as the weight of the belt and its accompanying sag will pro-

the belts all pull one way on the shaft. When using guide or tightening pulleys they should be applied to the slack side of the belt and near the smaller pulley. Belts adhere much better and are less liable to slip when run at a fast speed than at a slow speed, therefore, when possible, it is better to arrange to run small pulleys and run them at a high velocity than to run large pulleys.

A greater amount of power can be had from belts by having the crowns of the driving and receiving pulleys exactly alike and covering the face with leather, also having them wider than the belts required for the work. The width of belt needed depends on the speed and tension, the size of the smaller pulley and the proportion of its surface touched by the belt. The average thickness of single-ply belting is $\frac{3}{16}$ inch.

Belts made narrow and thick are more durable and work more satisfactorily than thin and wide ones, but it is not advisable to use a double belt on a pulley less than 12 inches in diameter, a triple ply on less than 20 inches in diameter, or a quadruple on less than 30 inches in diameter.

Quick motion belts should be selected as straight and as uniform in width, thickness and density as possible, and with permanent joints is practicable, that is, endless, and when the ends are joined lift out shafts, place belt on the pulleys and force shaft into place.

To find the length of belt needed when you have the diameters of the pulleys, and the distance between the centers of the shafts, multiply half the sum of pulley diameters by 3.2 and add twice the distance between the centers of the shafts. This result is usually near enough for practical purposes. If, however, the diameters are very different and the centers short the result will be too small. If the pulleys are exactly the same diameter multiply by 3.1416 instead of 3.2.

To find the horse power of belting: Multiply the width of belt in inches by the diameter of the pulley in inches, and this product by its number of revolutions per minute, and divide by 3300 for single, and 2100 for double. If one pulley is smaller than the other, multiply the result obtained by the corresponding factor in the table below.

To find the speed of a belt: Multiply the circumference of the driving pulley in feet by its revolutions per minute.

To find the width of a belt in inches required to transmit a given horse power: Multiply the number of horse power by 800 and divide by the speed in feet per minute. For unequal pulleys divide by the corresponding factor given in the table below:

TABLE OF CORRECTING FACTORS TO BE USED WHEN DRIVING AND DRIVEN PULLEYS ARE OF DIFFERENT DIAMETERS.

Arc of contact of belt on small pulley—	Correcting factor.
90°	0.65
120°	0.79
150°	0.91

To find the necessary speed in feet per minute to transmit a given horse power with a belt of a given width: Multiply the number of horse power by 800 and divide by the width in inches. For unequal pulleys divide by the proper factor in table.

To find the number of revolutions of either pulley, the revolutions of the other and the diameters being known: Multiply the diameter of the latter by its revolutions, and divide by the diameter of the former.

To find the diameter of pulley, the horse power and width of the belt being given: Multiply the horse power by 2750 for single, and 1925 for double, and divide the product obtained by the width of the belt in inches multiplied by its revolutions per minute.

To find the length of a roll of belting (approximately): Take the sum of the diameter of the roll and the "eye" in inches, multiply this by the number of turns or laps made by the belt, and this product multiplied by the decimal .1309 will equal the length of the belt in feet.

To find the weight in pounds of belts (approximately): Multiply the length of the belt in feet by the width in inches and divide the product by 13 for single, and 8 for double.

To find the arc of contact on small pulley of an open belt, multiply the difference of diameters of the pulleys by 57.3 and divide by distances between centers. Subtract the result from 180°.

Order belts equal to the work and surrounding conditions.

In fastening belts have ends perfectly straight and square, use clamps and splice on pulleys when over 6 inches wide.

Up to 18 inches in width make the splice the width of belt.

In punching holes cut out no more than is necessary; on leather use no awl.

In lacing have strings parallel on inside of belt; do not use wide or thick strings, and the oval hole with the hinge joint is best.

Keep clean, dry and free from accumulations of dust and grease, particularly oils.

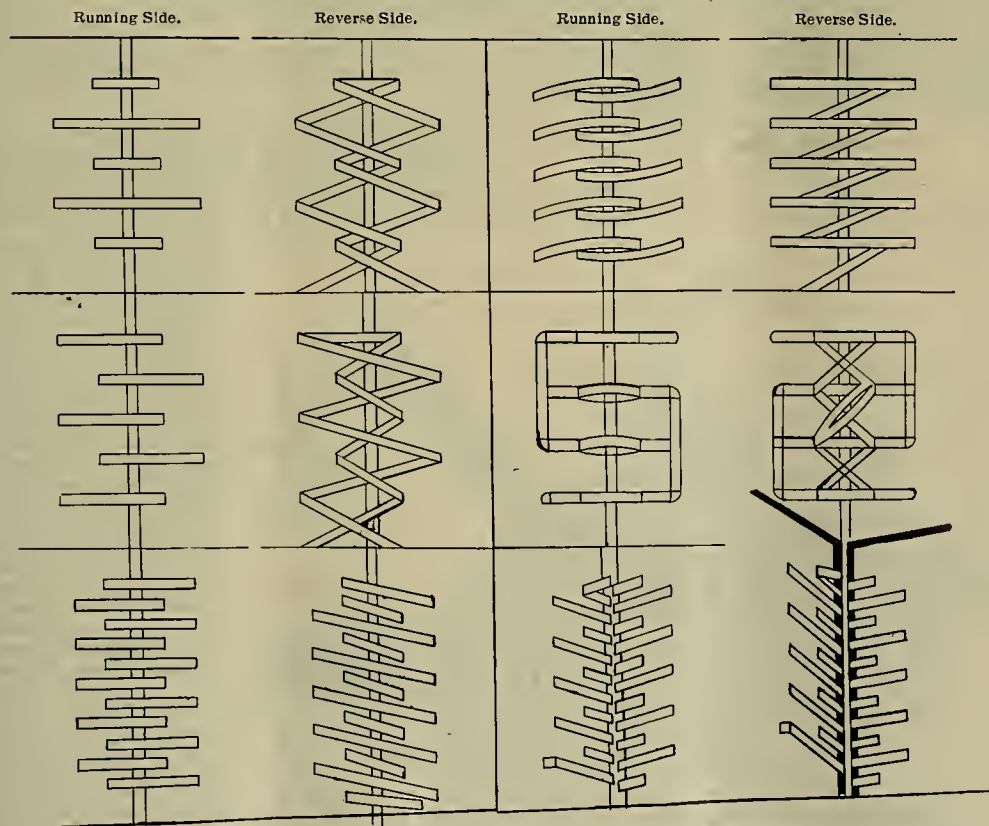

Splice and mend by cement rather than by riveting, lacing, wiring or using hooks.

Belts should be used with the grain or hair side

- 1—Single-ply belt before and after joining with taper splice.
- 2—Double-ply belt before and after joining with butt joint.
- 3—Double-ply belt before and after joining with taper splice.
- 4—Three-ply belt before and after joining with two taper and center butt joints.

Hinge Joint.

Sketch Showing Running Side of Belt (Next to Pulley) and Reverse Side of Lacing Away From Pulley.

most cases can be traced to the arrangement of the machinery, and in the style and width of belts used, and in the manner of their care. As circumstances generally have much to do with the arrangement and location of shafts and pulleys that are to be con-

duce an unsteady flapping motion and undue friction in the bearings. This last fault can be partially corrected by having the belts run off of each shaft in opposite directions, as this arrangement will relieve the bearings from the friction that would result when

next to the pulley, as they will drive 30% more and are not so liable to crack when they get old.

The direction of driving should run with and not against the lap.

The speed in feet per minute should not be over 4000 to 4500 for maximum economy.

Leather belts will not safely stand above 110° of heat.

Keep well protected from moisture, steam and water, and use rubber belts when exposed to the weather, as it does not stretch or decay.

Belts in time will usually stretch one-sixth the original length.

For a belt dressing use beef tallow, beeswax, prepared castor or neats-foot oil. Resin should never be used.

Power should be applied to the lower running side of a belt; let the upper side carry the slack.

All belts should run slack; if more power is required increase belt speed by using larger pulleys.

Strength of a belt increases directly as its width.

Power lost in belt transmission is from 20% to 80% of the power produced.

Factor of safety for a laced belt is one-sixth its breaking weight for leather, and one-eighth for rubber.

Double belting transmits about twice the power of single; light double one and one-half that of single.

Mines of Cherry Creek, Siskiyou County, Cal.*

Written for the MINING AND SCIENTIFIC PRESS by
H. W. TURNER.

Cherry creek heads at a divide about 7 miles southwest of the town of Yreka, and flows southwesterly to Scott valley. The lower part of the stream goes under the name of McAdams creek, the waters of which drain into Scott river, itself a branch of the Klamath.

The formations of this section of the county have a general northeast-southwest trend. The crest of the ridge to the south of Cherry creek is made up, in part, of fine-grained cherty rocks, of sedimentary origin, which in general appear to dip southeasterly. Underlying these cherts is an extensive greenstone series, evidently of volcanic origin, and chiefly fragmental in character, much of it being breccia or tuff. All of these rocks are older than the Cretaceous and probably of Jura-Trias or Carboniferous age.

Cherry creek ravine has been eroded out of this greenstone, which is everywhere much shattered and penetrated by veinlets of quartz and spar. Pieces of it usually show sulphides of iron. This greenstone belt contains all of the mines of the district, the best known of which are the Mount Vernon, the Cherry Hill, the Ironside, the Nebraska, and the Drummer Bay. All of these lie on the slope south of Cherry creek. In early days Cherry creek and its branch gulches yielded a large amount of placer gold. This quite certainly came from veins in the greenstone. One seldom finds so wide a zone of such thoroughly jointed and sheared and mineralized rocks as in this greenstone belt. Much of the placer gold doubtless came from seams and pockets, and, in general, one of the weak points of the district is the lack of strong, persistent and definite fissures, and the concentration of the gold values in these. Nature seems rather to have spread her treasures through too much ground, depositing the gold in numerous minute seams and pockets.

The Cherry Hill property is the one most developed. This is credited with a production from quartz veins in recent years of perhaps \$150,000. There are numerous veins on this property, two of which show the best values—the Little Queen, an east-west vein, with an average width of about 1 foot, and the Doctor's ledge, a narrow vein, averaging about \$25 in value. The trend of this vein is nearly true north, the dip being to the east at an angle of about 30°.

The croppings of the Queen vein cut across the top of the spur known as Cherry hill. The dip is to the south at an average of about 62.5°. An inspection of the old stopes suggests that the pay shoot was about 250 feet wide on the level of the middle tunnel, and about 200 feet wide on the lower tunnel level.

The gold is chiefly coarse and is frequently associated with galena. The sulphides embrace pyrite, chalcopryrite, blende and galena. Some of the galena, separated from the other sulphides and assayed, gave a return of \$133 gold per ton, while a similar test on ore rich in blende gave only low values.

The Cherry Hill veins are now being opened in depth by a long crosscut tunnel, which should tap the Queen vein at a point 700 feet vertically below the croppings. This tunnel has been run with machine drills. It is now in 1767 feet. Two ledges have been crosscut, but neither of these appears to be the Queen vein, which must flatten out slightly in depth. In all probability this vein is but a few feet south of the present face of the tunnel.

The region is well supplied with white and red fir for mining timbers, and there is an abundance of water, which is, however, rather rich in lime.

* See illustrations on front page.

DRAINAGE TUNNELS run through barren rock to reach a vein are only justifiable when it is known from development of the vein that the result will pay for the necessary outlay.

Use of Hydrogen Peroxide in Volumetric Analysis.

The manganese in manganese salts can be determined by converting it into manganese dioxide by means of hydrogen peroxide in alkaline solution, according to the Bulletin of Analytical Chemistry. The reaction is as follows:

and reducing the dioxide by means of an acid solution of hydrogen peroxide. The excess of hydrogen peroxide is then determined by titration with potassium permanganate. The total amount used is divided by two in order to obtain the equivalent amount of manganese. Free hydrochloric acid, if present, must be removed by boiling.

The active oxygen in lead peroxide and red lead can be determined in an analogous manner, the reaction in this case being

From 0.5 to 0.7 of the lead oxide is treated with a nitric acid solution of hydrogen peroxide of a known strength; 10 c.c. of dilute sulphuric acid are then added to the solution and the excess of hydrogen peroxide titrated with potassium permanganate.

For the determination of the metal in lead salts, lead peroxide is first formed by treatment with bromine and potassium hydroxide, and then reduced by treatment with an acid solution of hydrogen peroxide. In the case of mixtures of lead and copper salts, the lead is converted in this way into lead peroxide, and the precipitate collected, washed and reduced with the standard hydrogen peroxide. It is also possible to separate the lead as sulphate from mixtures of the salts of lead with other heavy metals, and to convert the lead sulphate into lead peroxide, which is determined as described above.

The presence of sulphur in various substances may also be determined by the use of hydrogen peroxide, as shown by J. Peterson in the Analyst for March. In the case of gunpowder, the sample is hoiled with an alkali in order to bring the sulphur into solution as a sulphide, then oxidized with hydrogen peroxide, and the sulphuric acid thrown down from an acid solution with barium chloride as usual. For greater accuracy, the acid liquid must be filtered from the carbon, and evaporated to dryness to remove the nitric acid before adding the precipitant. In many organic compounds, such as thiourea, allylthiourea, thiocarbanilide, potassium xanthate, dioxanthogen, carbon bisulphide, potassium thiocyanate, etc., the sulphur may be determined by dissolving the material in 100 c. c. of water or 80 c. c. of alcohol, and treating with 10 c. c. of 8% sodium hydroxide and 50 c. c. of a 3% solution of hydrogen peroxide. After driving off the alcohol on the water bath, water and hydrochloric acid are added, and the sulphuric acid precipitated as usual. There are, however, many organic compounds, such as thiophen, ethyl sulphide, thiophenol, and ethyl thiocyanate, in which the sulphur is not converted into sulphuric acid by the author's process. In esters of thiocarbonic acid, for instance, where it might be expected that one atom of sulphur should behave differently from the others, one-third of the sulphur is recovered by the method described.

Krom Cushioned Rolls.

In the Krom cushioned rolls illustrated herewith, the crushing springs are carried in cages to not

Krom Cushioned Rolls.

yield under ordinary crushing strains, the cages holding these in compression so that they may be independent of adjustment. Reverse springs on the inner parts of each tension bar act oppositely to the crushing springs, to hold them always against the frame, to keep the bars in a cushioned state, and thus prevent the movable roll from pounding against the fixed roll if the feed stops or iron passes the rolls. The movable hearings are kept in alignment by a solid connecting yoke, they thus being held in line whether or not the work is evenly distributed, or the spring tension on both rolls is not uniformly adjusted.

The tires are of Krom steel, secured by fixed and split cones, to make them rigid and quickly and easily removable, and to wear without grooving.

The frame is a strong single casting, the housings single hoods easily removable, the hearings of bronze with large oil wells. The roll shown in illustration is the 26-inch, having a width of 15 inches across the tire faces, giving great capacity.

By long experience in crushing with rolls the makers say that they find that to drive the rolls much faster than the material which they are crushing can fall to them from the hopper is not only a useless waste of power, wear and tear on the machine, but also increases the amount of slimes produced. Hence the rolls are designed to run at 100 revolutions per minute.

These rolls are supplied by the Krom Machine Works, 170 Broadway, New York City, N. Y.

Gems in the United States.

In his report to the United States Geological Survey, Geo. F. Kunz gives the following table of production of precious stones in the United States during 1902:

Sapphire	\$115,000
Ruby
Topaz
Beryl	4,000
Emerald	1,000
Phenacite
Tourmaline	15,000
Peridot	500
Quartz	12,000
Quartz, smoky	2,000
Rosette quartz	200
Amethyst	2,000
Gold quartz	3,000
Rutilated quartz	100
Agate	1,000
Moss agate	500
Chrysoprase	10,000
Silicified wood	7,000
Rhodolite	1,500
Garnet (pyrope)	1,000
Amazon stone	500
Turquoise	130,000
Chlorastrolite	4,000
Mesolite	1,000
Pyrite	3,000
Anthracite ornaments	2,000
Catlinite pipestone	2,000

This gives a preliminary total of \$318,300 for 1902, as compared with \$289,050 in 1901, and \$233,170 in 1900.

A CHAMBERED VEIN may be described as a deposit of ore lying on one side or on both sides of a fissure vein which is nearly regular in width, and constituting an enlargement of the vein, the enlargement being irregular in size and the ore usually of brecciated character. It should be distinguished from a swell in the vein which results in the formation of a lens-like mass of regular form. Chambered veins are doubtless the result of a fracturing of the country rock adjacent to a fissure, due to movement. Somelarge ore shoots appearing at the surface are sometimes disappointing upon development, proving to be merely a mass or chamber of ore adjacent to a small vein. Further exploration in depth, and also longitudinally, may result in the discovery of other chambers.

THE Yak tunnel driven from California gulch, Leadville, Colo., to drain the mines of Brece hill, has been completed at a cost of about \$1,000,000. Its length is 11,000 feet. A deeper and much longer tunnel has been started from Malta, in the valley of the Arkansas river, near Leadville, but work has been discontinued on it for the time being.

Gold Milling Practice in Bendigo.*

Written by H. C. BOYDELL.

This paper treats of the salient features of local gold milling practice and points out in what respects this practice differs from that of other large mining camps.

NATURE OF THE ORE TREATED.—This is essentially a free milling ore, the gangue being quartz and the gold occurring in coarse form. At times the ore crushed contains a great deal of slate, the latter imparting to the tailings a leaden hue.

Small amounts of sulphides, chiefly iron pyrites, and at times smaller quantities of arsenical pyrites, zinc blende and galena are contained in the stone. The average amount of sulphides contained in the ore cannot well be ascertained, as the concentrates obtained in all cases contain too much silica to form a basis of calculation.

L. A. Samuels informs me that the average is between 1% and 2%, but from samples of ore submitted to me for assay I think this too high and that 1% is the maximum.

DELIVERY TO THE BATTERY.—In no case is direct weighing adopted, the weight of ore being estimated by the number of trucks, or, in case of the battery being at some distance from the mine and carting, therefore, necessary, by the number of loads delivered at the battery. The average weight of ore to the truck may be taken as 10 cwt., the truck having

pinion and door required for the ore bins. In the batteries where hand feeding is in vogue one man or youth feeds ten stamps, the wage being from \$1.25 to \$1.50 per day.

MORTAR BOXES.—The weight of these, of course, depends on the weight of the stamps. It ranges between 2 tons and 3½ tons. The bottom is usually 5½ inches thick. No liners are used, it being considered that, as nearly all the batteries do custom work, the removal of the liners at the frequent "cleanings up" would entail too much work. To make up for this, the box has to be made considerably thicker and the weight, therefore, increased. As the box wears, the internal capacity, of course, increases. Inside copper plates are nowhere used. The discharge is vertical, the discharge opening of the mortar being divided into two by a vertical partition, which is a portion of the casting. The depth of discharge with new dies does not exceed 3 inches, and in some cases is as low as 1½ inch. As the dies wear, this is, of course, considerably increased. Chock blocks are not used to remedy the effect of this in the capacity per stamp.

STAMPS.—The weight of these ranges between 600 and 900 pounds. A few weigh 1000 pounds. The average height of drop is from 6 inches to 8 inches, with from seventy-five to eighty drops per minute. The order of drop is somewhat unusual. With each five head of stamps the middle one falls first, then the two end ones together, then the second and fourth, also together.

Shoe, about.....	25%
Tappet, about.....	9%
Total.....	100%
The figures with an 800-pound stamp being:	
Stem.....	Lbs. 345
Boss head.....	185
Shoe.....	200
Tappet.....	70
Total.....	800

CAM SHAFT.—The material is hammered scrap and the average diameter 5½ inches. In all cases the cam shaft is driven by gearing. In no case is helting used. The number of stamps raised by one cam shaft is in no battery on the field less than ten, each ten head of stamps thus having a pinion and spur wheel with the necessary clutch gear. In many cases more than this number of stamps are raised by a single cam shaft, the greatest number that I have heard of being fifteen.

THE GUIDES.—These are of cast iron, held in place by studs and lock nuts. The top guide, and in some cases the bottom one as well, is provided with a pinching screw and lock nut for holding up the stamp. The guides are lubricated with a mixture of anti-friction grease and tar in most cases, waste oily products also being used.

METHOD OF HANGING UP.—This varies somewhat. In some batteries, for instance, only the pinching screw in the top and bottom guide is used. The tap-

Quartz Mill at Bendigo, Australia, Showing Construction.

a capacity of 11 cubic feet. The load averages 20 cwt. and a capacity of 22 cubic feet. Both these weights, of course, vary within fairly wide limits, according to the size of the pieces of ore and the amount of moisture contained in it. Owing to the dryness of the workings and the small rainfall at Bendigo the percentage of moisture is never very high. With the method of estimating weight in vogue the returns of weight of ore crushed at Bendigo batteries can only be taken as approximate. In nearly all cases the stone is delivered into the battery hoppers, which in their turn deliver onto the feeding floor.

PRELIMINARY CRUSHING.—Breaking by hand is the method adopted in all but three mills. The three exceptions are those of the New Chum (English), New Moon and South Moon Companies, where rock breakers of the Gates pattern are in use. The lack of uniformity of size of the hand-broken stone is one of the contributing factors to the comparatively small output per stamp per day which is characteristic of milling in the district.

FEEDING.—The almost universal practice is to feed the ore into the mortar box by hand, only four batteries being supplied with mechanical feeders. These four are the New Chum (where a feeder made at the mine is in use), the Virginia (using an old pattern), and the New Moon and South Moon batteries, in both of which the Challenge feeder is used. At the South Moon the feeders being erected were made locally, costing \$100 each, with an extra \$25 for the rack

THE STEMS.—These are usually 12 feet long, from 2½ to 3½ inches diameter, and of the best hammered iron. The bottom is "jumped up" and then turned to the necessary taper, having a shoulder at its junction with the permanent head. Screwed tappets being used, the stem is provided with a plus thread, which effectually prevents it being turned end for end.

THE TAPPETS.—These are, as has already been stated, of the screwed type. The one most commonly used is Watt's. The California tappet is in use at the Prince of Wales battery. This is made up in three pieces, the material used being cast steel. The face engaging with the cam is case hardened and is removable. The total weight of the tappet complete is, with the heavier stamps, seventy pounds.

THE PERMANENT HEAD (BOSS HEAD).—This is of cast iron, provided with only one drift way for the removal of both stem and shoe.

SHOES AND DIES.—The shoes are made either of hematite cast iron or forged scrap, the dies of forged scrap, hydraulic pressed. The dies average 4 inches in depth when new, and in many cases are worn down to 1 inch in thickness. I can obtain no details with regard to the cost of shoes and dies per ton of ore crushed, the necessary data not being kept. The cost of either hematite iron or forged scrap in Bendigo is \$2.75 per cwt. The proportions which the weights of the various parts of the stamps bear to the whole weight are, approximately, the following:

Stem, about.....	43%
Boss head, about.....	23%

pet in this case is lifted clear of the revolving cam by a lever, the usual wrought iron bar at the feed side of the frame being used as a fulcrum. When the tappet is high enough the top and bottom pinching screws are tightened and the stamp so hung up. In other mills one pinching screw only is used, that in the top guide, together with a horizontal finger bar. In this case the stamp is first hung up with the pinching screw, and then the finger bar placed under the tappet for safety, the tappet being lifted high enough to admit of the finger bar being placed underneath by means of a lever in the usual way. The only battery in the district in which the California finger bar and cam stick are used is that of the Maldon Goldfields Co. at Maldon.

THE BATTERY FRAMES.—These are of various patterns. In some of the smaller batteries the "A" frame is used. The most common form, however, is the "horse." The material in most cases is wood, in a few cases cast iron. In no battery is the "knee" frame used. The use of the "horse" frame is accounted for by the fact of the cam shaft being driven by gearing, which necessitates the counter and cam shafts being on the same level.

THE OUTPUT PER STAMP PER TWENTY-FOUR HOURS.—This may be taken as ranging between 1½ ton and 2½ tons, the average being 2 tons. This is low when compared with American and South African figures, which run close to 4 tons, and in some cases exceed that amount. The absence of rock breakers and self-feeders contributes largely to make the output small. It must also be remembered that mining conditions

*Trans. Aus. Inst. Min. Engs. (condensed).

here do not require that as much stone as possible should be put through in a given time, as is the case in many mining fields. In Bendigo the getting of the stone is the main trouble, and in many cases, were it not for custom crushing, many of the batteries belonging to mining companies would be idle for a considerable portion of the year. Still, even with these conditions, it need not be forgotten that the cheapest way is to put as much ore through the battery as possible in a given time, the labor required being in no way increased by so doing. Here, again, the hush of increased first cost, necessitated by heavier stamps, larger motive power, etc., seems to be an insuperable barrier under present conditions of mining finance.

The cleanup takes place in most batteries weekly, usually on a Saturday. The skimmings are usually worked up every fortnight only. The amalgam is retorted in pot retorts and the gold is, in nearly all cases, sold without being smelted.

The average length of copper plate is 10 feet, set at an inclination of 1 inch per foot, with several steps and a ripple between each two plates. In some cases the last plate is not amalgamated, though what good

The gold scale is digested with nitric acid to remove the copper and the residue melted. The copper plate, if it is to be used again, is scoured clean and then amalgamated in the usual way.

The heating to redness naturally leads to oxidation of the copper, and, as the oxidized parts only amalgamate very imperfectly, it is fairly common to find the plates when subsequently used again for amalgamation to contain spots that tarnish readily and require constant attention. The charge made for scaling in the manner just described is from \$1.85 to \$2.50 per plate, though some years ago it was \$5.

(TO BE CONTINUED.)

The Elmore Process.

Among the most recent metallurgical processes to attract attention is that of effecting a concentration of sulphide ores from their gangue by means of crude petroleum. The process, though still in the stage of development, promises commercially satisfactory results in the future. A long series of experiments made at the University of California have indicated

the possibilities of this novel process.

An experimental plant has been installed at Rossland, B. C., where ores are treated in the same manner that they would be in a larger commercial plant, with the difference that in the experimental plant some of the work is accomplished by hand that would in a large plant be conducted automatically.

The operation of the process as described by H. H. Claudet includes the mixing of the pulp with oil during which operation the oil comes in contact with the mineral values and holds them in suspension.

The separation of the oil from the mineral in a centrifugal machine with a specially constructed solid basket.

The drying of the product therefrom in a second centrifugal machine with a perforated basket.

In the hand plant the mixing is performed in a 3-foot drum about 1 foot deep which revolves vertically and has an opening in the front through which the sample in the form of pulp is poured in. The oil is then added in about the proportion of one-quarter to three-quarters the amount of sample taken, depending on the quantity of mineral therein. There are small haffle plates inside the drum which cause the mixture to get thoroughly agitated simply by turning the drum slowly a few times by hand. When the oil has picked up enough mineral it is skimmed off the water and the tailings are run out through a plugged hole in the circumference of the drum. The tailings are allowed to settle and then are dried, weighed and assayed.

The separation of the oil which has been collected takes place in a small type of centrifugal machine which has a speed of 2000 revolutions per minute and is driven by an electric motor.

The drying is accomplished with the same machine by interchanging the solid basket for the perforated one, which has a cloth bag fitting inside and in which the concentrates are dried.

These are weighed and assayed, and both the actual recovery of values is obtained and also that by difference between the original sample and the tailings.

Having proved in the testing plant that any particular ore is thoroughly suitable to the treatment, it must next be considered, before going further, if the local conditions allow of the concern to be a commercial success, and it may be well to look into these conditions as they would affect the oil process.

It must be expected that the field for the Elmore process will be greatly on the low grade properties, which will necessarily mean that everything must be designed and worked on the most economical lines; and while it is possible to treat at a profit certain ores which could not be worked by any other method, the margin must not be cut too fine, and it should be proved beforehand that there will be sufficient profit to allow for the fluctuations in the metal market and any other contingencies which are likely to crop out.

A Prospector's View.

TO THE EDITOR:—Ofttimes have I wondered why our otherwise generous Uncle Sam is so partial in regard to the mining fraternity—favoring the rich and able to pay people and ignoring the poor prospector's difficulties. While every citizen has a right to a homestead, the prospector, who is the pioneer of all countries and who seldom uses his right for a homestead, has to stay in the mountains and see if his prospect will amount to anything and let, for the present at least, all hopes of a home go by, as he is, through poverty, unable to have too many irons in the fire. But the thing I am coming to is this: Why could not the poor miner, having expended \$500 in labor, or improvements, on each mining claim, and complied with the requirements of the law regarding a patent, have the same rights as a homesteader? In other words, why could not this Government give the land free instead of charging \$5 per acre, so as to put the poor, faithful developer on the same footing as the better favored. Goodness knows it costs \$100 per claim to have it surveyed, besides the fees necessary to get a patent (there is a very small reduction in price if one has more than three claims to be surveyed), so it is obvious that it is beyond the poor man's ability to procure a patent, even if he had the money for the surveyor, which he would have to earn by days' pay, because very few of our class are horn with silver spoons in their mouths. I think, if acted upon by the proper people in the proper place, something could be done to help the never-tiring fortune hunter to secure the ground where he spent so much money, time and energy, at least free of charge from the Government. A decline in copper, silver or lead would not let him lose all, at present, if he had a patent, but he could hunt up a new field until these metals regain such a value as would enable him to come back and work the property. While the Government would probably receive less money for the present, the different States and communities would grow richer through taxes on patented ground. I can not see why this is not worthy of consideration from those people that are supposed to represent us at Washington; it would be one of the best mining laws ever made for poor mining men.

E. KAGEL.

April 12, 1903.

[The mining laws of the United States were framed with a double purpose—to secure every reasonable right and privilege to the prospector and miner, and at the same time to foster and promote the industry of mining. It would be inexpedient to allow claim holders under existing laws to acquire title as in the Homestead entry without cost, as a citizen of the United States may locate as many claims as he desires and can hold all he cares to "represent" by performing the necessary annual assessment work. A claim holder need not apply for a patent to his claim, but may hold it indefinitely, under possessory title, by performing the annual assessment work. As soon as patent is obtained the claim is subject to assessment and tax, and it then becomes an additional source of expense. A claim that has been patented does not improve in value if allowed to remain idle, consequently if there is no intention of working the mine after patent for the reason that it will not pay, it would be a waste of money to patent the claim, and it would be far better to put the same amount of money into the development of the claim. In a general way it may be said that a mining location that does not produce pay ore is not worth patenting. On the other hand, a claim which produces pay ore may be held without patent, but if patent be desired it is usually no hardship to the owner of a paying mine to meet the necessary expense.—Ed.]

Hot Blast in Pyritic Smelting.

TO THE EDITOR:—I am glad to see by your late issues that Messrs. Carpenter and Bretherton both agree that a hot or warm blast is a "sine qua non" in pyritic smelting. I have held that opinion for over two years. With us hot blast spells "success" and cold blast "failure and freeze-up." We heat our blast to 200° C., and that is enough, by waste gases from furnace, boilers or gas engines, and we do straight pyritic smelting. Our blast heating does not cost us a cent, as the heat developed in the furnace is amply sufficient if used intelligently. Pyritic smelting is, after all, only a roasting process, and what we can not oxidize goes into matte. One quarter of one per cent of copper is enough in the ore to catch all the precious metal values, and with hot blast you can do so without barren fluxes, which are necessary with cold blast. A straight silicate of iron slag is all right. Hot blast practice is totally different to cold blast practice, as I know well, and the man who has not worked both is not qualified to judge.

Parral, Mexico.

WALTER E. KOCH.

Battery of the South New Moon Co., Bendigo, Australia.

purpose this can serve is somewhat difficult to see, as the unamalgamated surface is always covered with film of basic carbonate and hydrated oxide.

Mercury is fed into the mortar box at regular intervals, and a considerable proportion of the total weight of amalgam is got from the mortar box at the cleanup. The exact average proportion I have not been able to ascertain. The loss of mercury per 100 tons of ore averages 1 pound.

The plates are usually scaled once in six months, the work being done by men who follow this as an occupation. The method of scaling as commonly adopted is the following:

The plate after being removed from the table is heated over a slow and even fire till all the mercury is volatilized. It is then rubbed with hydrochloric acid, covered with damp hags, and allowed to stand usually till the next morning. Next the plate is rubbed with a strong solution of equal quantities of ammonium chloride and niter. It is then slowly heated till uniformly red hot, and allowed to cool.

The gold rises in blisters and is scraped off with a chisel. Should any part of the plate be left unaffected by this treatment, it is again rubbed and heated. In some cases the heating is not carried to redness till the plate has become so brittle that it has to be discarded. A plate in this condition is usually sold for old copper, though not, as far as I can find out, at a price based on its assay value.

Water Hoisting in the Anthracite Region.*

Written by R. V. NORRIS, Pittsburge, Pa.

The removal of mine water by hoisting in tanks instead of pumping, while somewhat a reversion to the methods of the ancients, has come rapidly into favor in the anthracite region of Pennsylvania the past few years. At the present time there are eight large collieries at which all the water is hoisted, and six more plants are in preparation.

In the earliest regular hoisting by semi-cylindrical tanks at the Nanticoke collieries of the Susquehanna Coal Company the tanks were attached under the regular shaft carriages, taking in water through six large clack-valves in the bottom, and discharging through an end gate opened by a lever which was operated by a guide piece on the shaft head frame. The objections to their use were: That water could only be hoisted during the night shift, or when the shafts were not in use for hoisting coal, thus requiring a very large sump, and greatly limiting the water capacity of the plants; that the alternate wetting and drying of the shafts did considerable damage to the timber; and that the collection of ice in the main shafts, which are invariably down takes for the ventilation, endangered the men in going up and down in their work. These reasons, with the gradual increase of water beyond the capacity of the plant, led to the abandonment of this method of hoisting, so that now these tanks are used only in emergencies. The method was, however, one of the cheapest ever devised for handling a moderate amount of water from deep shafts, as practically the only cost was for the steam used, the extra wear and tear of engines, ropes, shaft guides and timbering, and the extra oil required for lubrication. The hoisting engineers being required by the Pennsylvania mine law to be in the engine houses at all times, and night firemen being necessary at all colliery plants, there is really no additional labor cost to this method of hoisting. These tanks have a capacity of 1300 gallons (174 cubic feet) each, and fifty per hour was an ordinary dump, so the total capacity, from a shaft 1000 feet deep, was about 750,000 gallons (8700 cubic feet) per day of twelve hours.

The present method of hoisting from a special water shaft or water compartment was first used in 1896 at the Luke Fidler colliery, Shamokin. The plan was the outcome of the successful use of tanks in unwatering the colliery, which had been flooded to subdue a mine fire.

The tanks were made to dump as in Fig. 1, and to

give the tank a slight tilt toward the third guide; this shoe slides on the guide, keeps the tank steady and in a vertical position until the dumping wheels, near the top of the tank, engage the dumping rail at the top of the shaft, and the tank turns gently, pouring its contents into the discharge basin. Another great advantage of the third guide is the steadiness it imparts to the tank and the smaller liability to accident from shaking the guides loose.

The original tanks were provided with a single, large, flat, clack valve at the bottom, which, in dumping, tended to swing to a vertical position and allow a small escape of water through it. This also struck the water very heavily in descending. The latest tanks are constructed with butterfly valves, set on a 45° angle, which entirely obviates the loss in dumping and enters the water as a wedge with a much less severe shock. (Figs. 3 and 5 to 8.)

To successfully operate these dumping tanks it is essential to arrange a rest in the sump on which the descending tank is supported while the upper tank is dumping. Without this the lower tank and rope may overbalance the upper tank, with nearly half its weight supported on the dumping track, and raise it sufficiently to reverse it in the shaft, and possibly do damage to the sheave.

As the usual dimensions of shaft compartments are about 7x13 feet, it is the general custom to use only one compartment for water hoisting (Fig. 2). This

FIG. 2.

compartment is divided into two parts by an extra line of huntins (when discharging at the end of the shaft), or two sets of guides are put on the sides of the compartment, with the extra guides on the ends, when dumping at the sides of the shaft. The arrangement of two tanks in one compartment also reduces to a minimum the extra size and cost of shaft for water hoisting. The water hoisting engines are then usually set at right angles to the coal engines,

to avoid placing one sheave over the other, with the resulting extra liability to wrecks.

Bottom-dump tanks, instead of end-dumping ones, are exclusively used by the Philadelphia & Reading Coal & Iron Co., and also by our companies, as emer-

FIG. 4.

gency hoists in the coal compartments. These are generally constructed (Fig. 4) with the intake valve at the bottom, and are provided with a trip lever, operated by a guide in the head frame, to raise this valve at the top, and a discharge casting to direct the outflowing water to one side into the basins or troughs. The various types of discharge castings and valves in use are shown in Figs. 5 to 8. In all of

these it will be noticed that an effort has been made to reduce the blow incident to striking the water by the use of wedge-shaped castings. The Lytle Coal Co. use a wedge-shaped sheet iron shield, outside of the discharge casting, which reduces the shock still more.

The objections to this style of tank are its unsteadiness in hoisting at high speed, slower discharge through the bottom valve (the experience at William Penn colliery having shown an advantage of 10.1% in favor of the end dump), and, greatest of all, the danger of damage to guides caused by the slanting nose striking the water and consequent side pressure on the tank, which is intensified by the reaction of the water entering on one side only. In our experience with both types there has been practical immunity from trouble with the guides from the end-dump hoists, and almost constant difficulty with them when the bottom-dump tanks are used. One guide at the water level, forced out after thirty days' service, was cut into 1½ inch by the wear of the tank guides. The cast bottoms are also more liable to breakage from striking obstructions or floating timber than are the wrought iron tanks, the cast valve seats of which can be made heavy enough to withstand any ordinary hattering without unduly increasing the weight of the tanks.

The discharge casting (Fig. 7) is designed to minimize these difficulties. The plan is to make an open casting, which is a perfect wedge provided with a central partition, to take water in on both sides, and thus avoid the side thrust due to the slanting bottom and side entry of the water.

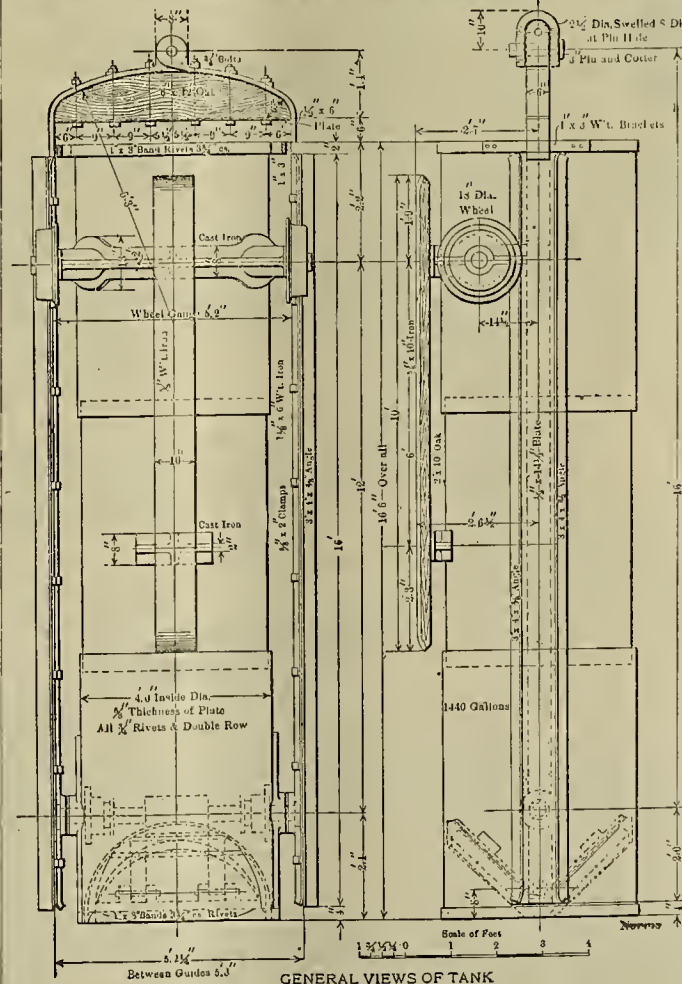

FIG. 3.

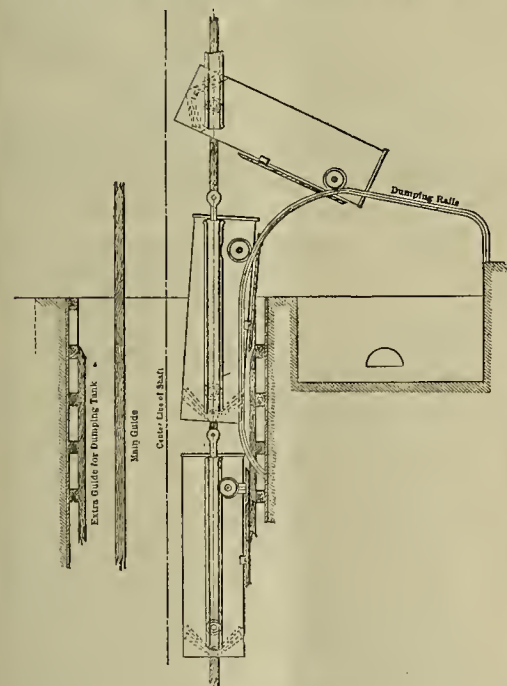

FIG. 1.

get the maximum size were made square with angle-iron corners; it was found almost impossible to keep them tight, and round tanks have been substituted.

The original method of dumping was the use of small wheels bearing against the guides to retain the tanks in a vertical position while hoisting; these passed through slots in the guides when the main dumping wheels reached the dumping rails (Fig. 1). These small wheels, if made of iron, rapidly destroyed the guides, and if of softer material only lasted for a few hoists. The present method of handling these dumping tanks is the use of a third guide (Figs. 1 and 2) at right angles to the main guides, and providing the tank (Fig. 3) with an extra shoe, set so as to

Milling at the Camp Bird, Colo.*

NUMBER III.

By THOMAS H. WOODS and GONFREY D. DOVETON.

The master mechanic, W. Scheele, has arranged an excellent device for controlling the suction opening; it is a sliding valve, of boiler plate, set in a frame, and attached to the suction nipple by set screws. The slide is attached to a lever, which, in turn, is connected to a float. As the water rises in the settling box the valve is opened wider, and vice versa. This arrangement makes it impossible for the pump to take air, and the pump works very smoothly. A Cornish float was formerly in use, but it was not a success.

The cost of elevating the pulp, which settles in the leaching vats, amounts to $3\frac{1}{2}$ cents per ton, of which $3\frac{1}{4}$ cents is for power and $\frac{1}{2}$ cent for maintenance and repairs. A tailings wheel for elevating the tailings is under consideration, and, though the first cost will be large, the writers are convinced that this will speedily be balanced by the reduction in power, and the greater freedom from wear and tear.

The pulp is distributed in the vats by Butters and Mein distributors, which have been found satisfactory, the slimes passing off at three slime gates (fitted with slats 4 inches deep, set in a groove) placed at equal distances round the circumference of the vat. No attempt is made to classify the pulp before delivery to the vats, owing to the impracticable nature of the ground. The separation of the slimes takes place in the leaching vats, from whence they are conducted and settled in the slimes dam and stored for subsequent treatment, during the summer months. The leaching vats in the older portion of the mill are arranged for double treatment, and there are four sets of 100-ton vats and one set of 200-ton vats.

The bottom of the upper vat is set 4 feet 6 inches above the top of the lower. It rests on girders of channel iron, which, in turn, are supported on steel columns, in the center and around the circumference.

A series of experiments was conducted on 100-ton and 200-ton charges, to determine the adaptability of these tailings to single direct treatment, and the results were so flattering that, in a recent addition made to the mill, two vats, 40 feet in diameter, with a 6-foot stave, arranged for single treatment, were installed.

In the future additions to the mill, vats of even greater diameter, probably 60 feet diameter, will be installed, for single treatment.

Some comparative notes will be added to this paper relative to single and double treatment.

GRADING TEST.—A grading test of the product settled in the vats may be of interest:

(1) Product settled in a 24-foot vat, 100-ton charge.

(2) Product settled in a 30-foot vat, 200-ton charge.

(3) Product settled in a 40-foot vat, 300-ton charge.

Grading Test (1).—Two of these vats are filled at once, each vat getting about half the pulp.

	Per Cent.

" " 200- ".....	16.00
Passed 200- ".....	20.60

Grading Test (3).—These two vats, used for single treatment, are filled singly.

	Per Cent.
Retained on 40-mesh.....	11.80
" " 60- ".....	22.60
" " 80- ".....	12.80
" " 100- ".....	1.00
" " 120- ".....	19.20
" " 200- ".....	10.00
Passed 200- ".....	22.60

The leaching vats are fitted with a filter bed consisting of pine slats $1\frac{1}{2}$ inches in width and 2 inches deep, placed $1\frac{1}{2}$ inches apart. In the wooden vats the slats are simply nailed to the bottom, and about against an annular ring slightly rounded on the periphery, and placed 1 inch from the staves. The slats are also rounded on the top, and, to admit of free circulation of the solution, crozed on the bottom at regular intervals. Over the slats is tacked a layer of cocoa matting, 2 inches smaller in diameter than the floor of the vat. A 12-ounce duck filter cloth, about 6 inches larger than the floor, is stretched over the matting, and firmly grouted

down with an inch rope between the ring and the staves. In the upper series of vats a heavier duck is required, the friction of the shovels being sufficient to wear out the cloth in about five months. In the lower series, however, an 8-ounce duck will wear for fifteen to eighteen months. The matting will last a considerable time—four or five years.

A No. 4 centrifugal pump is used for returning the solution from the pumps to the storage vats, or directly to the leaching vats. Zinc shavings are used as a precipitant, and the precipitating plant consists of four extractor-boxes, containing the strong solution. Each of these boxes is divided into six compartments 36 inches long, 24 inches wide and 28 inches deep. Three boxes, each with seven compartments, 30 by 30 inches and 36 inches deep, are employed on the weak solution. The waste solution, before leaving the mill, is passed through two zinc boxes of seven compartments each. All the boxes are fitted with side launders for the delivery of the zinc-gold slimes to the reduction tank. The gold liquor is drawn off from the top of the tank thoroughly clear, and no filters are required in the zinc boxes.

Sulphuric acid is used for the reduction of the precipitate, and after a thorough washing and drying they are melted into bars on the premises.

THE CYANIDATION.—(a) Double Treatment. After the charge has been sampled, leveled, and the requisite quantity of lime (found from acidity test on 100 grams of pulp) added, the cyanide solution is applied and allowed to percolate through the ore. A copy of the mill diary notes, taken during the treatment of a charge of tailings, will illustrate the current practice. It is to be understood that the treatment varies as changes in the nature of the ore are manifest.

Charge No. 127. Vat No. 5 (upper). Ore, 200 Tons.

Tons KCN.	Strength of KCN.	Day.	Hour.
30.....	.07%.....	June 9.....	10 A. M.
20.....	.25%.....	June 10.....	3 A. M.
20.....	.25%.....	June 10.....	5 P. M.
15.....	.25%.....	June 11.....	2 A. M.
25.....	.25%.....	June 12.....	1 A. M.
10.....	.25%.....	June 12.....	8 P. M.

At 3 P. M., June 13th, the charge was shoveled to the lower vat (No. 5). This required six men eight hours.

Charge No. 127. Vat No. 5 (lower). Ore, 200 Tons.

Tons KCN.	Strength of KCN.	Day.	Hour.
23.....	.30%.....	June 14.....	1 A. M.
10.....	.25%.....	June 14.....	3 P. M.
10.....	.25%.....	June 14.....	11 P. M.
10.....	.25%.....	June 15.....	8 A. M.
15.....	.06%.....	June 15.....	10 P. M.
20.....	.06%.....	June 16.....	11 A. M.
Tons Water.....			
20.....		June 17.....	2 P. M.

The charge was then allowed to drain until 2 A. M., June 18th. The residues, after sampling, were discharged by 10 A. M., June 19th.

Samples taken from the charge during the leaching period showed the following per cent of extraction:

Day and Hour.	Per Cent of Extraction.
June 10, 3 P. M.....	28.6
June 11, 3 P. M.....	42.4
June 12, 2 P. M.....	64.8
June 13, 2 P. M.....	74.2

The charge was then allowed to macerate twelve hours with a .30% KCN solution, and gave extraction as follows:

Day and Hour.	Per Cent of Extraction.
June 15, 7 A. M.....	76.5
June 18, 2 A. M.....	77.4

A final tailings sample was taken, just before discharging, which showed an extraction (by assay) of 77.25%. The rate of leaching, in the upper vat, varied from eleven gallons to seven and one-half gallons per minute. It was about fifteen gallons per minute in the lower vat (No. 5).

The values, as will be noticed, yield rather slowly to the solvent action of the solution. This is no doubt partially due to small particles of coarse gold, which are apt to be enclosed in the larger grains of sand. The system employed in charging the vats is to fill two of the 100-ton vats at once and the 30-foot and two 40-foot vats singly. A good deal of concentration goes on in vat No. 5, and the extraction percentage is correspondingly decreased. The extraction cited in charge No. 127 is below the average of the 100-ton vat extractions. It is due entirely to the elimination of a great percentage of the slimes, and is very much below the average extractions obtained in single treatment in the larger vats. The percolating solutions from all the vats are regularly titrated for free cyanide, and, when required, for total cyanide at least once every eight hours, and frequently several times in a shift. The titrations serve as a guide in controlling the treatment of each vat charge. A few of the titrations made on the outgoing solution from charge No. 127 show:

At 8 A. M. on the 10th of June, .01% free KCN and .03% total cyanide.

At 8 A. M. on the 11th of June, .09% free KCN and .15% total cyanide.

At 8 A. M. on the 13th of June, .19% free KCN and .195% total cyanide.

The large quantity of double cyanide found in the weaker solutions first coming from the charge is probably formed from the nascent HCN, liberated from the action of acid salts uniting with the zincate of potash contained in the working solution, to form zinc potassium cyanide.

The gold values in the solution show a gradual rise from a few cents at .005% test to their maximum value at .22—.24%, again declining to 20—35 cents per ton when the solution falls in cyanide to .03%—.04% when the residues are discharged.

A total consumption of cyanide of from 1 pound to 1.25 pound is found in double treatment; 0.7 to 0.8 pound is consumed by the cyanicides (chiefly copper minerals), about .125 pound is discharged with each ton of tailings, and about as much more, per ton of ore, is run to waste out of the mill, the combined gold being removed, in part, by the waste zinc boxes. A small amount is rendered inert, of course, during the precipitation of the bullion in the zinc extractor boxes, but a portion of the cyanide contained in the double salt of zinc is regenerated, when leaching, as potassium or sodium cyanide. The consumption of cyanide due to zinc precipitation is usually so small that it is scarcely appreciable.

A great deal of cyanide is consumed after the charge has been shoveled to the lower vat, and the solution applied. This is probably due to the oxidation of some of the cupriferous minerals. The consumption in the single direct treatment system is approximately 0.7 pound per ton, about .35 to .45 pound of which is due directly to the presence of cyanicides in the tailings; the remainder is lost by dilution and by the discharging of a certain amount with the residues. The lower consumption is solely due to the fact that there is no shoveling, and consequent aeration and oxidation of the baser minerals.

Exhaustive experiments on a large scale have recently been carried out with a view of recovering the cyanide contained in the waste solutions. It was clearly demonstrated that a large percentage of the free cyanide, and that combined with the zinc, could be recovered with ease and profit, and converted into an effective extracting solution.

The cyanide that combined with the copper could also be recovered cheaply, but, in view of the low chemical consumption obtaining, it was not deemed advisable to install a "recovery" plant.

SINGLE TREATMENT.—(b) The treatment of the tailings is carried on much in the same manner in single as in double treatment. The solution, usually 0.25% KCN, is kept in circulation for seven or eight days, or until the assays of samples, taken at regular intervals from the charge, show that an adequate extraction has been obtained. When the vat is filled, care is taken not to drain the charge of more water than sufficient to enable the sampling and leveling to be done comfortably. It seems of importance to allow the particles of sand to be surrounded with a "water cushion." If the charge is completely drained before applying the solution, the sand packs tightly, and subsequent leaching operations are much retarded. No vacuum is employed in either of the systems, as no difficulty occurs in obtaining a good rate of percolation.

An example, illustrating the single treatment, is copied from the mill diary, and the percentage rate of extraction after certain periods may be of interest.

The charge—No. 267, vat No. 6, 300 tons—was filled at 9 A. M. on December 29, 1891, and after sampling and leveling and adding the requisite lime, forty tons of .06% KCN were applied at noon, and also at 10 P. M. of the same day. A .25% solution of KCN was then applied, and kept in circulation for seven days, with occasional periods of maceration. The charge was then allowed to remain in contact for twelve hours, drained partially, and weak washes of .06% KCN, amounting in all to sixty tons, were applied. (The solution washes are run on till the vat is filled to the brim, thus making use of the slight head obtained to aid percolation). When the weak solution had drained sufficiently, about thirty-five tons of water were applied, and by midnight of January 8, 1902, sufficient cyanide was removed to allow of the residues being sampled and discharged. The actual time of treatment was eleven and three-quarters days, and assays taken from the pulp during that time, at intervals, show the following rate of extraction:

No.	Time.	Per Cent Gold.	Per Cent Silver.
(1)	1 P. M. Dec. 30.....	12.40	4.00
(2)	3 P. M. Jan. 1.....	53.60	21.20
(3)	2 P. M. Jan. 3.....	68.00	42.60
(4)	2 P. M. Jan. 5.....	77.50	50.00
(5)	4 P. M. Jan. 7.....	85.00	57.00
(6)	12 M. Jan. 8.....	85.70	63.00—Final tailings.

The rate of percolation on this vat charge was about seventeen gallons per minute for the first couple days, and gradually slackened to from ten to twelve gallons near the end of the treatment. The total quantity of solution received, including water washes, 340 tons, or 1.13 ton per ton of tailings.

*Trans. Am. Inst. Min. Eng. (condensed).

Mining and Metallurgical Patents.

PATENTS ISSUED APRIL 14, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

FURNACE FOR ROASTING ORES.—No. 725,056; T. Edwards, Ballarat, Victoria, Australia.

In combination with elongated reverberatory furnace, tunnel under hearth thereof, hearth having openings extending therethrough, sleeves within openings, air regulators for controlling passage of air through sleeves, rables within furnace having stems projecting downwardly through sleeves and having hollow stems projecting upwardly, line shaft in tunnel, gearing between line shaft and stems of rables, means for supplying rables with cooling medium through hollow stems.

AMALGAMATING MACHINE.—No. 725,309; A. H. Woodruff, Chicago, Ill.

Combination with amalgamating cylinder, foraminated, superimposed cylinders, on amalgamating cylinder, longitudinally separable into halves.

APPARATUS FOR TREATING ORES.—No. 725,321; S. C. C. Currie, New York, N. Y.

Ore hopper and conveyor leading therefrom, closed chamber into which conveyor empties, incline in chamber leading material from conveyor to inlet end of heating drum, heating drum and means for conveying steam to delivery end thereof, whence it passes through drum to closed chamber, and escape pipe from closed chamber.

APPARATUS FOR COLLECTING AND SEPARATING IMPURITIES FROM METALLURGICAL FURNACE GASES.—No. 725,352; E. J. McAleer, Sharpville, Pa.

Apparatus for removing impurities from blast furnace gases and collecting impurities, comprising combination with separating chamber having inlet and outlet openings, open passage for blast furnace gases through chamber formed by walls of separating chamber and centrally disposed dividing wall, fluid supply located in separating chamber through which gases pass, tank below separating chamber into which fluid and impurities from gases fall, and valve for controlling discharge from tank.

APPARATUS FOR BURNING OIL FUEL.—No. 725,408; J. S. Chapman, Albany, N. Y.

Apparatus for heating steam boilers by use of fuel, consisting of conduit to convey portion of inflammable waste gases from uptake of boiler to firebox; air conduit inside waste gas conduit arranged to convey air under pressure to firebox, terminating inside short of exit end of waste gas conduit; steam conduit inside of air conduit terminating inside and short of exit end, air conduit arranged to convey and discharge steam into firebox; oil conduit inside of steam conduit and terminating inside and short of exit end of air conduit, arranged to convey and discharge oil into the firebox, all arranged and operating so that the oil, air and steam discharges combine, produce suction in waste gas conduit and draw waste inflammable gases from uptake, so oil discharge be compelled to pass centrally into rapidly moving steam discharge, both oil and steam discharges into air discharge and these combined into waste gas discharge, having means for controlling discharges.

MINER'S TOOL.—No. 725,420; A. V. Des Moines, Silver Plume, Colo.

A miner's tool, comprising pivoted members, one of which is provided with opening or space, the other formed with spaced notches, and lance having slotted shank slidably confined in space of member and provided with locking projection arranged to fit into either of notches of other member.

PROCESS OF TREATING COMPLEX ORES OF ZINC.—No. 724,637; W. C. Wetherill, Canon City, Colo.

Method of recovering precious and other valuable metals from zinc-bearing ores with which they are associated, by associating with ores sufficient quantity iron to render metals (by resulting combination) susceptible to magnetic separation, reducing and dis-

tilling zinc by aid of excess carbon in closed retort, thereby producing carbonaceous residuum containing iron in association with metals to degree sufficient to render latter magnetic, crushing residuum, and separating magnetizable precious and other valuable metals therefrom magnetic by attraction.

PROCESS OF EXTRACTING COPPER FROM CARBONATE AND OXIDE ORES.—No. 725,548; H. R. Ellis, Salt Lake City, Utah.

Process of extracting copper from carbonate and oxide ores and material carrying carbonate or oxide of copper, treating ores or material with aqueous solution containing mixture of carbonate and bicarbonate of soda and carbonate of potash.

CENTRIFUGAL LIXIVIATING MACHINE.—No. 725,549; H. R. Ellis, Salt Lake City, Utah.

Combination of hollow rotary shaft, drum mounted thereon, perforated partition within drum, arranged concentrically with periphery of drum and located at such distance therefrom as to form annular chamber about perforated partition, filtering medium on inner face of perforated partition, radial supply tubes communicating at inner ends with hollow shaft and at outer ends with annular chamber, means for supplying liquid to hollow shaft.

ROCK DRILL.—No. 725,227; L. E. Decker, Chattanooga, Tenn.

Combination of support, drive shaft, plunger provided with rack teeth, mounted to reciprocate in support, spring adapted to be compressed to project plunger, gear wheel in mesh with rack teeth on plunger for retracting same and compressing spring, drive shaft on which gear wheel is loosely mounted, radially movable dogs carried by shaft for engaging gear wheel to lock same thereto, and means for retracting dogs to release gear wheel.

PROCESS OF EXTRACTING BROMINE.—No. 725,161; A. W. Smith, Cleveland, Ohio.

Treating bromine-laden gas to action of alkaline carbonate and subject resultant gases to action of absorbent for carbon dioxide.

GOLD EXTRACTION PROCESS.—No. 725,257; T. B. Joseph, Mercur, Utah.

Process of extracting gold and silver from ore containing same, when in suitable condition, which consists in subjecting ore to leaching action of solution of water, cyanide of potassium, bromine, hydrate of calcium and carbon dioxide, intimately mixed, simultaneously agitating ore by compressed air forced upward through same.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence).—The report of big pay having been uncovered on bench off No. 2 Daniels creek has been confirmed; so also a paystreak 20 feet in depth and unknown width on Tripple creek; also a body of pay gravel on MacDonald creek, a tributary to Nome river, both of the latter undoubtedly on the old beach line. Work is progressing favorably on Anvil and Dexter, Kelly's pumping plant is being erected, supplies are being hauled to the creeks, and everybody seems to be active.

On Mystery creek, a tributary of Shovel, a number of camps are busy taking out dumps, also on Solomon river.

On Peluk creek a number of dumps are being taken out which should add to the winter output of gold of Nome.

The reported strike on Shantuk, a tributary to the Kobuk, about 600 miles from here, is not as extensive as reported, although as there is timber and small game in that section of the country it is better for the prospector.

Since gambling has closed down a number of gamblers went to work on the windlass, and although the town seems deserted, yet it is a step in the right direction, the gambling element will leave the town and the prospector and miner will be the gainer. Some business houses are affected by the closing down of the games, mostly restaurants and furnishing establishments.

The fire of two weeks ago burned the Dexter, Warwick and Bodega buildings, causing about \$15,000 damages. The volunteer fire department had to work like Trojans, with the temperature 40° below zero. The citizens of Front street subscribed the sum of \$1000 to be divided among the volunteers, besides putting a gymnasium into their headquarters.

The temperature has been low all winter; again the temperature is down to 40° below zero. Since Dec. 17 the temperature averaged 25° below zero; it is the coldest winter Nome has experienced in its four years of existence.

Nome, Feb. 8.

(Special Correspondence).—Good pay is being found on Solomon river, large dumps being taken out from benches extending from Big Hurrah to Shovel creek. A big strike is reported from an old channel of Willow creek, tributary to the Cassa de Pago river, off No. 7 above. Details are lacking.

Nome, Feb. 15.

J. Barnette, founder of Fairbanks in the Tanana mining district, is at Skagway and says when he left, on March 22, there were 243 buildings under construction at Fairbanks and the population was 800.

J. A. Garoutte of the Mlocene Ditch Co., near Nome, says their tunnel between the head of Snow gulch and Anvil is nearly finished. Twelve men are at work on the tunnel and it is expected water will be turned on next month.

ARIZONA.

GILA COUNTY.

At the Old Dominion mine at Globe the four-compartment shaft is down 110 feet. Two steam hoists will soon be used in sinking. Two sinking pumps of 600 gallons per minute capacity each were received last week, one being placed in the old shaft and the other reserved until needed in the new shaft. Arrivals of coke tax the capacity of the smelter bin.

Thompson, Barclay & Lund have a lease on the Golden Eagle mine, 1 mile northwest of the Black Warrior plant and southeast of the Sultan group of gold mines, near Globe.

D. D. Sullivan has a lease from the Old Dominion C. Co. on the New York & Chicago copper mine, near Bloody Tanks, 6 miles west of Globe, and has men at work.

The pumps and machinery at the Malory shaft, on the Globe-Boston group, near Globe, are being overhauled and put in shape preparatory to cutting the station and starting the crosscut tunnel at the depth of 450 feet in the shaft.

GRAHAM COUNTY.

(Special Correspondence).—In Greenlee district, 6 miles northwest of Clifton, G. W. Williams et al. are working the Senator mine and have a tunnel in 240 feet. The first vein cut is 9 feet wide and the second 15 feet. The ore runs \$6 in gold and 4% copper. The face of the drift is 175 feet under the Red Giant and Mother Lode. They also have five claims in the Laura D. group. One of the leads yields as high as \$128 per ton by arrastra treatment.

Clifton, April 20.

The Review says native copper has been struck in the Arbuckle mine, which adjoins the Antietam mine, near Clifton.

A gasoline engine and hoisting plant are being put up by the Coronado M. Co. on the Sapphire mine, near Clifton, where the company will sink a 500-foot shaft.

MARICOPA COUNTY.

R. Christenson of London, Eng., has bonded the Mountain View group of three claims and a millsite on the Black Canyon road, north of Phoenix. The lode is 10 feet wide, averaging \$10 per ton in gold, and the country rock is granite.

MOHAVE COUNTY.

(Special Correspondence).—J. Carroll reports silver ore on a claim between the Juno and Mormon Girl mines, near Chloride, assays of which show fifty-eight ounces to the ton.

At the Emerson mine the shaft is down 80 feet and the vein continues 8 inches wide, with gold values. A pumping plant will be put in.

The mine and mill at the Tennessee resumed last week. A contract has been let for drifting 100 feet on the 500-foot level and the main shaft is being sunk deeper. Stopping on the 200-foot and 300-foot levels is breaking ore for the 100-ton mill. The Elkhart mill is crushing ore from the 500-foot level.

The Redemption mine shipped half a carload of its high-grade gold, silver and copper ore this week. The tunnel is in 55 feet.

The Jack Flynn gold claim, on the south extension of the Samoa mine, has a quantity of ore on the dump ready to ship, which averages five and one-half ounces to the ton. Silver-bearing lead ore is coming in.

The Fraction mine, owned by Hughes & Mitchell, shipped four tons of ore to the smelter this week.

The shoot struck by O'Shea & Dempsey, 9 miles west of Chloride, is showing eight-ounce gold ore at a depth of 14 feet, in limestone.

T. McNeely made a shipment of ore from his mine on the summit of Sherwin's peak this week. Sixty feet of work in sinking has been done. The principal values are in silver, with some gold and copper.

The Lone Star mine at Mineral Park is being successfully worked by lessees.

At Cerbat several mines are shipping ore.

It is reported that a shoot of silver ore has been struck in the Earl mine at Stockton Hill.

It is understood that the mines at White Hills will be operated on the leasing system.

Chloride, April 21.

The main shaft of the Queen Bee mine, Mineral Park, has been sunk 30 feet below the old level and three shifts are at work.

Last week Superintendent T. McNeely shipped a 20-ton car of ore from the Argo mine, near Kingman, to the smelter. The ore carries values in silver and lead.

At the Gold Road mine, near Kingman, the mill is expected to be in operation next week. All the machinery is in place. It is estimated there are 100,000 tons of \$15 ore blocked out in the mine and in the ore bins. In the bottom of the main shaft on the Gold Road the ore averages \$20. Recently the company leased a part of the Gold Line to two men, who are taking out ore that averages \$60 per ton. This ore the company will treat in the mill.

PIMA COUNTY.

(Special Correspondence).—The Tucson S. & R. Co. has bought the Copper King group of mines, 14 miles southwest of Tucson in the Tucson mountains. They will erect a smelter. In one of the main tunnels they have a body of ore that runs 20% in copper. They have twenty-four claims in all. The property is now developed will produce fifty to sixty tons per day. W. W. Robinson is manager.

The Catalina Copper M. Co., operating the Catalina group of mines in the Catalina mountains, will put in a pump, hoist and drills; also intend erecting a smelter. They report having 75,000 tons of sulphide ore blocked out, averaging 7% copper, \$2 in gold and \$2 in silver; have 4000 feet of development work on the property. There are fifteen claims in the group. F. M. Hartman is manager.

The Gould group, 12 miles west of Tucson, have one shaft on No. 5, 60 feet deep, all in low-grade ore; No. 1, 50 feet deep, the last 30 feet in ore running 15% copper; one tunnel in 65 feet, the breast sampling 16% copper, \$1.50 gold, four ounces silver. S. H. Gould is manager.

Tucson, April 20.

PINAL COUNTY.

(Special Correspondence).—Pinal Paraffine Oil Co., near Kelvin, have their well down 1200 feet and claim to have struck a good grade of paraffine oil, but not in paying quantities as yet.

The Roy mine is owned by an English

syndicate, who are doing development work. Their mill is at Kelvin, 5 miles distant. Mine and mill are connected by narrow gauge railroad. The Troy-Manhattan Co. intend erecting reduction works on their property at Kelvin.

Kelvin, April 20.

YAVAPAI COUNTY.

Manager B. Blanchard of the Iron King mine, southeast of Prescott, says he is working 100 men; the mill has been inclosed; the 1½-mile water pipe line from the Agua Fria is half completed; a pumping plant will force water from the river to the mines; an air compressor and other machinery is on the ground. Ore is being shipped to the smelter. A drift from the 100-foot level is in 1140 feet; crosscutting and blocking out ore is the main work being done; the three-compartment working shaft is down 40 feet; an electric plant will be put in.

M. Greer reports finding, three-quarters of a mile northwest of Brodie's Crown Point mine, near Prescott, a ledge 14 feet in width, which assays \$80 in gold and silver.

Manager E. M. Clark of the Chicago G. M. Co. has put in at the company's mine in Groom Creek district, 6 miles south of Prescott, a 40 H. P. boiler, hoist and pump and resumed development. G. Woods is superintendent. The shaft will be sunk to 500 feet and drifts run.

The Prescott Courier says the Gold Link M. Co. operating the Sultan group of mines in Santa Maria district, near Prescott, has the frame work for its 20-stamp mill up. A sixty-ton per day cyanide plant will also be erected. There are 35,000 feet of development work on the Sultan mine, the average value of the ore being \$20 a ton gold.

CALIFORNIA.

CALAVERAS COUNTY.

The Lamphear quartz mines, south of Mokelumne Hill, will be started up next week under Superintendent J. E. King. A new shaft will be sunk. The mine has been prospected to a depth of 300 feet.

J. M. Evans, superintendent of the Forty-nine placer mine, has a bond on a group of gravel mines near Douglas Flat and is arranging to begin work. On the Forty-nine mine he has put up a pumping plant.

At the Salvator quartz mine on Esperanza creek, near Jesus Maria, work in the tunnel is in progress. An upraise is being run, ore blocked out and ten stamps are dropping in the mill.

The first payment on the Lloyd gravel mine at Central Hill, near San Andreas, recently bonded to H. H. McIntyre et al. of Boston, Mass., was made last week. Development work is in progress.

The Gold Cliff mine of the Utica Co. at Angels is being operated with oil as fuel. The oil is pumped up to the tank on a hill 60 feet high, from which it runs direct to the furnace.

Baumhoger Bros. at Altaville, near Angels, have consolidated their mine with the Eastern and Great Eastern and will work them through the Baumhoger shaft.

EL DORADO COUNTY.

The 10-stamp mill on the Tincup mine, near Placerville, is being removed by J. C. Sullivan and set up at the Jasper mine on Webber creek.—The Rustlers' M. Co. will put a mill on the Gamecock mine, says the Nugget.

KERN COUNTY.

The Associated Oil Co. is shipping oil from Kern River field, near Bakersfield, and from McKittrick at the rate of 10,000 barrels a day. They are providing additional storage of 650,000 barrels capacity. One earthen reservoir has been contracted for, to contain 400,000 barrels, in the Kern River field, and another to hold 250,000 barrels, in the McKittrick field. This last will be lined with brick and cement. The company is keeping three drilling rigs at work, says the Reporter.

The Alameda Oil Co., at Sunset, is drilling wells Nos. 4, 5 and 6. The first of these is in sand, the second is down 600 feet and the third 200 feet, and No. 7 is rigging. The Elk has its No. 2 down 1050 feet; the Arcola No. 3 is at 500 feet; A. C. King & Co. are down 750 feet; the Four Hundred Oil Co. 1150 feet and the Sunset Center 650 feet. The Chico, 10 miles south of Sunset, is increasing the depth of its well from 1200 to 1500 feet. The Sunset Asphaltum & Refining Co. has begun work on its refinery at Sunset. Part of the machinery is on the ground.

The Kramer Con. Oil Co. has resumed at Hiawatha, near Randsburg, and expect to deepen 1000-foot hole to 1500 feet.

MARIPOSA COUNTY.

Six stamps are to be added to the 4-stamp mill of McCarthy & Soderberg at Kinsley.

The Hite mine, Jerseydale, has been leased to Arkell Bros. and five stamps are dropping in the mill.

NEVADA COUNTY.

Preparatory work for putting in ten more stamps at the mill of the Union blue gravel mine, at North Bloomfield, has begun, says Superintendent Gassaway, and it is expected to have them dropping by July 1.

The Peabody mine, near Grass Valley, is being unwatered, after being closed down for ten years. J. C. Roberts is superintendent and C. Christopher of Seattle, Wash., is manager. The company will use oil for fuel. The boiler capacity of the plant has been increased, and a 45 H. P. hoist, capacity for 1500 feet depth, put in. The mine is opened by two incline shafts 600 feet apart, the north or main one being down 450 feet. After the water is out, a compressor and machine drill will be put in.

Superintendent W. H. Martin of the Sierra Queen, near Nevada City, reports development work progressing. A station is being cut at the 420-foot level, after which drifts will be run north and south on the ledge. With this completed, sinking the shaft will be resumed. He also says the mill on the Mayflower mine, at Canada Hill, of which he is principal owner, will be started up.

Work on the Alta-California gravel mine, near Grass Valley, under bond to G. W. Root, manager of the Grass Valley Con. Co., will begin next week.

Thirty men started work last week at the Hudson mine, near Rough and Ready, on the construction of a ditch which will convey water for power to operate the Hudson and Niagara mines.

M. D. Colley, owning the Ocean Star and several other quartz claims near Ormonde, in Washington mining district, has bonded his properties to the company operating the Red Cross mine at Omega, near Washington. Development work will begin next week.

J. Rehar of San Francisco has bought a one-third interest in the Sailor Boy mine near Nevada City.

PLACER COUNTY.

The Never Sweat mine, near Westville, is being worked by Denton & Dodds.—The Herman mine, near Westville, recently sold to J. B. Hanna et al., is expected to start this week. The company intend to increase the number of stamps from twelve to twenty-two.

PLUMAS COUNTY.

The Johnny Bull, in North canyon, S. Firmstone superintendent, has its hoisting works in operation and stations are being cut at several levels. The mill is being overhauled.—The Round Valley Con. Co. will be started up as soon as the roads permit.—The cyanide works are near completion, says Superintendent F. Wheelock of the North Canyon M. & R. Co., near Beckwith.

The Feather River Con. M. Co. has taken on more men, all of whom are engaged in digging a canal to carry water to the cement mill at Iron Bar, near Spanish Ranch, says the Independent. This canal is 10 feet wide on the bottom and will carry 3 feet in depth of water, which will operate a 21-inch horizontal cased turbine wheel, capable of generating 43 H. P. Lumber is being hauled from Gansner's mill to Iron Bar for the erection of a mill building, reservoir, etc. In cutting through a body of cemented gravel in digging the water ditch the gravel showed gold values.

SAN BERNARDINO COUNTY.

The St. George group of mines is expected to begin operations next week. This property is under bond to C. H. Thompson et al. It is in Vanderbilt, 4 miles from Manvel.

SANTA CLARA COUNTY.

The Alberta Oil Co. at Sargents began drilling last week ½ mile west of their former site.

At the Statton quicksilver mine, near Hollister, Superintendent S. Smith has men at work. A furnace will be erected next month.

The Chapman quicksilver mine, near San Jose, is reported sold to R. B. Harper, manager of a company of Boston and New York men. The new owners will spend \$100,000 in machinery and development work.

SHASTA COUNTY.

The management of the De Lamar smelter at Bully Hill (Winthrop P. O.) report the smelter will be started up again May 1st, having been closed since October, 1902.

The Quinby Creek M. Co., operating near Redding, are planning to erect a 20-stamp quartz mill. Manager Beall, formerly superintendent of the Bully Chooch mine, says a wagon road will have to be built that machinery may be hauled in. Fitch, Cunningham, Cronin & Beall are the owners.

SIERRA COUNTY.

M. H. Mead, manager of the Keystone mine, 3 miles south of Sierra City, says

pay ore has been struck at a depth of 600 feet below the old workings. A tunnel has been run for 4500 feet. Sixteen men are at work and more will be added next month. A mill will be erected in the summer.

SISKIYOU COUNTY.

A. W. Williams, owning the Indian Girl mine, on Klamath river, has bought the Blue Gravel mine, near Yreka, and will reopen it.

TRINITY COUNTY.

M. Manley, superintendent of the Enterprise mine, on the East Fork, near Trinity Center, says a sawmill is being erected and work will begin this summer on a 20-stamp mill. The 10-stamp mill now on the property will resume next week.

R. Hicks, superintendent of the Bobs Farm mine, near Junction City, says operations will resume next week.

TUOLUMNE COUNTY.

H. W. McPherson of Los Angeles has bought the Maud and Last Chance mining claims at Hall's crossing of the Stanislaus river, 2 miles north of Confidence, for \$1000.

At the Grizzly mine, near Carters, the raise is finished from the tenth to the ninth level, and drifting into the shoot has begun.

At the Mohican mine, near Groveland, Superintendent F. Chappellett has sixty-five men at work—thirty-five on the new road to the top of the hill. At the mine gold quartz is being taken out and the mill is running steadily. A station is being cut out 300 feet in on main tunnel No. 1, where the hoist will be set up. The excavation for the compressor to run the machinery is finished.

J. R. Johnson has bought the pocket mine in Buchanan district, south of Carters, says the New Era, and will open up the drift and crosscut.

The Starr King mill, near Carters, was started up this week by Superintendent C. A. Holland.

Drifts are being run north and south from the 1000-foot level of the Grizzly mine, near Carters.

Work has been resumed in the Mayflower tunnel, near Groveland, to tap the channel, after a temporary shut-down caused by a breakage to the machinery.

The Little Beauty mine at Arrastraville, near Carters, is being reopened by F. Cook and C. F. Fox.

Superintendent J. F. Gilles of the Sierra G. M. Co. says the work of putting the hoist and machinery in condition at the Del Monte mine, near Groveland, is nearly complete. The damage done by the recent fire was not so serious as at first thought and operations will resume next week.

YUBA COUNTY.

The Eymard estate, on the north bank of the Yuba river, 9 miles east of Marysville, has been sold to W. P. Hammon & Co. for \$90 per acre. This tract was deeded to the United States Government for a right-of-way for debris barriers, the right to extract mineral, however, being reserved. It is the mineral rights which Hammon & Co. have bought, and dredgers will be used. A prospecting drill will be put on next week.

COLORADO.

BOULDER COUNTY.

At Sugar Loaf the Tungsten is shipping thirty-five tons of ore daily under the management of W. F. Rowen. They are working twenty men. The Recluse at Sugar Loaf, which has been idle for several years, has resumed. They will sink a vertical shaft and put in a plant of machinery, says the Boulder Miner.

Superintendent J. A. Jester has resumed work at the North Western mine at Caribou. The shaft is down 190 feet and several levels run.

CHAFFEE COUNTY.

Ore has been found in the Newitt mine, at Newitt, east of Buena Vista. The find shows a 35-foot vein at a depth of 265 feet in the lower level. A narrow shoot runs 2000 ounces silver. B. F. Morley of the Buena Vista smelter has a lease on the mine. Arrangements are being made to ship a car of ore a day to the smelter.

CLEAR CREEK COUNTY.

Manager Tingle has made the second installment in payment for the Highland Laddie and Centralia claims on McClelland mountain, in East Argentine district, near Georgetown, and adjoining the Santiago claims. It is locally reported the Waldorf M. & M. Co. is the real buyer. The management is arranging for the erection of concentrating plants to treat their low-grade ores.

The Specie Payment mine, on Bellevue mountain, near Idaho Springs, has resumed and contracted with the Bonieta mill for handling their ores. An air compressor is being set up at the Lucania tunnel and driving towards Bellevue mountain will resume. This tunnel will cut the Specie Payment mine in 3000 feet and at a depth of 2000 feet. Colorado Springs men are at the head of the Lucania tunnel. At present they are sinking a shaft in Russell gulch to connect with the tunnel for an air shaft.

The Hazleton M. Co. are putting in machinery at the Baltimore mine, near Silver Plume, says the Standard. The tunnel will be driven ahead to cut the Shively and other veins, and the shaft on the Baltimore vein will be sunk farther.

Manager Hartshorn of the Pacific mine, near Georgetown, reports their ventilation fans and power plant in operation. Electric drills will be put into the mine. Construction work for the mill at Yankee has begun by the Yankee Con. M., M. & T. Co., of Denver. The initial capacity will be fifty tons per day, but the building will be made large enough to double the capacity, which they expect to do next summer.

FREMONT COUNTY.

The Portland Cement Co. of Florence has bought 2000 acres near Coaldale, in the western edge of the county. On the land is a deposit of gypsum. The company proposes to use this gypsum for the manufacture of cement and plaster of Paris. A road will be built connecting the main line of the Rio Grande Railroad and the gypsum bed, a distance of 2 miles.

GILPIN COUNTY.

The Rex group of eight claims, in Gamble gulch, near Central City, have been sold to the Black Diamond M. & D. Co., composed of Detroit, Mich., men, for \$20,000. The property is partially developed by the Rex tunnel, which is in 150 feet from Gamble gulch slide. Operations have begun with G. D. Kaye of Boulder as superintendent.

The Rhoderick Dhu G. M. Co. has incorporated to develop the Rhoderick Dhu and Protection claims on Quartz hill, near Nevada, above Central City. The incorporators are L. G. Haunstein, W. G. Cover and L. F. Butler. J. C. Fleschutz is manager. The workings will be equipped with a hoisting plant capable of extracting the ore to a depth of 1000 feet.

McFarlane & Co. of Black Hawk have men at work on the main building of the Gregory-Buell, where a 45-stamp mill is being placed. The stamps will be of the slow-drop pattern. Contracts will be given for 1000 feet of machine driving. Upraises will be made to connect with the bodies of low-grade ore, the higher grade ore in the meantime being shipped to the custom mills, sampling works and smelters.

E. C. Miles of Denver, of the Edna and Mida G. M. Companies, says they will erect a 20-ton amalgamating and concentrating plant at the junction of Russell and Lake districts, near Russell gulch. It is the intention to have the plant in operation by June 1st.

Idaho Springs parties have a lease and bond on the Stacy group, near Rollinsville, and have begun operations. There is a tunnel in 125 feet and a number of shafts. J. Knowles, formerly of the Newhouse tunnel at Idaho Springs, is superintendent.

GUNNISON COUNTY.

The Porcupine group of five copper claims on South Gold hill, near Pitkin, have been sold for \$9000 to Waterbury & Adams of Denver. The workings consist of a tunnel in 1100 feet and an incline shaft down 120 feet on a 9-foot vein. At 450 feet from the south entrance of the tunnel a 4-foot vein is exposed, carrying \$8 in gold and silver, the walls being porphyry. At 600 feet a 12-foot contact vein is showing, the ore running 5% copper and \$2 in gold and silver.

HINSDALE COUNTY.

A strike of gold is reported made last week in Larson gulch, near Lake City, and a rush to that section has started, many claims having already been staked. H. Karl, W. C. Butler and L. Dubois cut a 4-foot vein, the ore assaying five ounces gold and 170 ounces silver.

LAKE COUNTY.

Manager Chauvenet of a company of Denver men has begun work on the California Gulch placer ground, near Leadville, beginning below Bucktown and extending west 4000 feet. Seventy-five acres, mostly in the basin of California Gulch, have been leased. A drilling outfit is prospecting the ground and a dredger will be put in this summer.

At the Bartlett mine on Sugar Loaf mountain, near Leadville, the tunnel is in 800 feet with 500 feet yet to drive before striking the veins for which the tunnel was started. This is expected to be finished by August. An air pump has been put in and connected with the turbine water-wheel, which is operated by the water running out of the tunnel. During the last three months the smelters have reduced treatment charges on Sugar Loaf ore from \$9 to \$4. This treatment applies

to siliceous ores carrying fifteen to twenty ounces in silver and from \$2 to \$3 in gold. With this schedule many properties on Sugar Loaf will be able to operate during the summer at a good profit.

Manager Nicholson says the Coronado shaft at Leadville has been unwatered and a crosscut will be driven to connect with the Midas. The Midas mine, now being drained by the Penrose, will, when connection is made, be drained directly by the Coronado.

The Iron Silver Mines Co. propose within the next three months to start up the Iron mine, near Leadville, says the News-Dispatch. This mine has been abandoned for the past twelve years. As soon as the North Moyer shaft has been completed and the surface equipment in operation, Manager Walsh says he will take the present plant to the Iron mine shaft and begin work. It is intended to connect all three shafts and to open up the ground to determine the ore in sight. The Iron Silver Mines Co. has several hundred acres on Iron hill and Manager Walsh thinks it can be made to produce paying ore in lead, copper, silver, iron and zinc values. The Moyer mine is shipping 200 tons of zinc ore per day.

T. Kyle, manager of the Boulder mine, in Big Evans gulch, near Leadville, says machinery will be put in, including a 100 H. P. boiler and a pump.—The Collins group, H. B. Collins manager, expects to resume work this week. The Reno will be operated first, and the Big Evans gulch group later.

The tonnage from the mines around Leadville for March aggregated 74,000 tons of all classes of ore. The output of zinc was 7000 tons—exceeding that of February. The total value was \$1,000,000. It is expected that the present month will show an increase and that the output will reach 3000 tons per day.

At the Sixth-street shaft, at Leadville, on the 600-foot level to the west, manganese-iron ore has been struck, some of it showing values in silver. Osgood & Sullivan are lessees.

LA PLATA COUNTY.

The Mary Helen M. Co. has organized to operate on Oro Fino hill, near the Neglected group, near La Plata. The main working is a tunnel of 500 feet, and a contract has been let for 100 feet more. W. C. Chapman is president, E. H. Van Endert manager.—A company has been organized by C. S. Thomas, C. J. Hughes et al. of Denver to operate on a group near the Neglected mine.—The Bonnie Girl Co., organized last fall, is patenting a group in Tiburco gulch, on the La Plata river, near La Plata, and will build a combination mill this year.

MONTEZUMA COUNTY.

The La Plata Miner says around Mancos by June 1 more men will be employed, more mines worked and a greater amount of ore shipped than at any time since the camp was discovered.

OURAY COUNTY.

G. E. Pierson, having a lease and bond on the Gold Queen group of twenty-three claims and a mill site, on the divide between Poughkeepsie and California gulches, near Ouray, says a mill for concentration will be erected during the present year, in addition to the completion of two crosscuts now in some distance.

The Iron City mine, 2 miles from Ironton, owned and operated by the Continental-American G. M. & M. Co., will begin operations next week.

PARK COUNTY.

The Olive well in the South Park field, 5 miles north of Hartsel, has been sunk to 1250 feet, by Chicago parties, incorporated as the Illinois-Colorado Oil, Coal & Gas Co. They have already struck two seepages of oil and a flow of gas.

SAGUACHE COUNTY.

A strike was started last week in the Independent mine, at Crestone, when forty miners, engineers and pumpmen quit work because of the importation of two engineers from Leadville to work a twelve-hour shift in place of three eight-hour shifts, as were formerly run. Manager McGeorge will keep the pumps going if possible. The Leadville Miners' Union, of which the two new engineers are members, has been asked to prevent the coming of any more of their men to take the place of the strikers. Manager McGeorge and Superintendent McNeeley are Leadville men. There is no union in the Crestone district, though union wages have been paid and most of the men belong to Creede and other unions. The only cause for the strike is the determination of the management to work the engineers twelve hours instead of eight hours, as formerly.

SAN JUAN COUNTY.

The Bessie McKisson G. M. Co., operating the Bessie mine, in Minnie gulch, near Silverton, has been reorganized as the Lake Shore Con. G. M. Co., with E. J.

Cable, F. H. Evans and L. V. McKesson officers and W. A. Ptolemy superintendent. The present work is confined to running two tunnels on either side of the gulch on the Bessie vein.

Mining operations in the vicinity of Animas Forks is being revived by the announcement that the Silverton Northern Railroad will be extended into that section during the coming summer. Not only will the road tap the Burrows Park country, but will open up the way for some of the mines of Poughkeepsie, Mastodon and other gulches to ship at a profit.

SAN MIGUEL COUNTY.

Work of reconstructing and putting in new machinery in the Alta mill, in Turkey Creek basin, is progressing, says Manager Mansfield, and operations will resume next week. The plant will comprise twenty stamps, a Huntington mill, vanners and concentrators, and have a capacity of 100 tons daily. When the mill starts the number of men at work in the mine will be increased to seventy-five. The vein carries 3 feet of heavy ore running in gold, silver and lead values.

At the Butterfly mine at Ophir the tram has been equipped with a new cable and the mill repaired. At present only ten stamps are dropping, owing to scant water supply, but this will be increased with the melting snows. The drift being driven from the lower crosscut which tapped the vein last fall has reached a depth of 500 feet, in ore the entire distance, while an upraise being driven is in the same character of ore. Assays show an average of \$23 in gold. Other than the ore taken out in the driving of this drift and upraise, which supplies ten stamps, no ore is being extracted, as the upraise must be connected with the upper levels for ventilation before many men can be worked to advantage.

SUMMIT COUNTY.

Manager G. Tyler of Hastings, Neb., says he will put in an air compressor and machine drills in the Nebraska tunnel, on Baldy mountain, near Breckenridge. The vein was cut by a shaft farther up the hill and a tunnel started lower down. This vein carries gold, silver and iron and is a low-grade proposition.

TELLER COUNTY.

Manager Wattles of the Bull Hill M. & Dev. Co. has finished building the ore bins on the Cresson mine at Cripple Creek and shipments are resumed.

The Mint Con. M. Co. at Cripple Creek report shipping five carloads of \$40 ore last week. Most of the ore is being broken in third level at depth of 460 feet; vein 3 feet in width. J. H. Williams has a lease on the Boston and Cripple Creek group on the east slope of Tenderfoot hill.

The property of the Copper Mountain Co. on Copper mountain, near Cripple Creek, has been leased to W. Swanson and H. P. Reiton of Cripple Creek, who intend to begin development to locate the contact, where it is believed the main ore shoot of the hill will be found. Machinery will be put in. The shaft on the Lost Lillie claim will be used.

The Independence Con. shaft at Cripple Creek is down 1240 feet, going to the 1250-foot point, being sunk by the Cripple Creek M. Co., lessee. They have run levels at every 100 feet and the level at the 1150 foot point has been extended west to the vein and work is being done in a crosscut to the south to reach the Glorietta shaft. The lessee has shipped a large tonnage. It is understood that the company expects to start work again next month on company account and do additional development.

The Chicolo Con. Co., owning ground on Tenderfoot hill, Cripple Creek, will begin operations next week on company account. The work will be confined at first to development. The deepest shaft is 175 feet. The claims lie on the west slope of Tenderfoot hill and are contiguous to the Hoosier.

The reduction plant of the Gold & Globe Co., in Goldfield, began operations this week. It has a capacity of 100 tons of ore per day. The company has installed an entirely new plant of machinery on the Ironclad mine. They are hoisting fifty tons of ore per day and will increase this amount to 100 tons.

A 4-drill air compressor has been put up on the Cripple Creek Enterprise at Cripple Creek, and machines are at work in the mine. The crosscut in 200 feet north of the shaft from the 210 foot level, which is the bottom of the shaft, will be extended.

IDAHO.

BOISE COUNTY.

The War Eagle Co. began piling their East Hill placer ground near Idaho City last week.

W. A. Stevens of the Mines Exploration & D. Co., operating near Idaho City, says work will be resumed on the Dora group of claims. A tunnel has been driven on the ledge for 125 feet, showing the vein 4

feet wide with assays of \$30. The ore is free milling.

CUSTER COUNTY.

The Idaho Central G. M. & M. Co. has incorporated under South Dakota laws to operate the Fred Pratt and the Ready Bullion claims, adjoining the Lost Packer mine, near Mackay.

IDAHO COUNTY.

Manager C. F. Macey of the Iron Springs M. Co. of Youngtown, O., operating in Rapid Creek district, near Warren, says development work will be increased and machinery put in this season. Work at the mines has been in progress all winter, and as soon as the hoist is placed in position sinking will resume. It is intended to build a concentrator.

Kansas City, Mo., men have organized the Brant G. M. & M. Co., to take over and develop several groups of claims in Thunder Mountain district, near Roosevelt, including the Yankee Boy and Pearl properties, on Little Marble creek, near where it empties into Big creek.

The Elk City G. M. & M. Co., owning the Lily May group, on Red river, near Elk City, will drive the tunnel 100 feet farther. J. Coverly, part owner, says the claims are 2 miles west of the American Eagle group, and development has shown a 6 foot ledge carrying gold values. A surface cut exposes a ledge of free-milling ore assaying \$15. The tunnel should tap the ledge 50 feet farther at a depth of 200 feet.

F. Brown, manager of the Jumbo mine in Buffalo Hump district, near Hump, says he expects the new mill to be ready for work by the first of July. They will have fourteen stamps to start with, although the building is being erected for thirty stamps. The Crackerjack Co., in the same district, has a surveyor on the ground preparing plans for an electric power plant, the power to be generated on Lake creek.

SHOSHONE COUNTY.

Wallace reports that the option of the smelter combine to acquire certain Cœur d'Alene mines has been extended. The deal will include the principal producing mines of the Cœur d'Alenes except those owned by the Empire-State, Bunker Hill and Hercules companies.

The Moscow Citizen says the Evolution mine at Osburn, the first location in the Cœur d'Alene district, is again producing ore with values in copper and gold.

B. C. Hammitt and H. Oxley are hydraulicking at the foot of the Montana bar at Thiard.

The Cœur d'Alene M. Co., operating the placer diggings west of Murray, are preparing to resume. They have forty men at work, and the sawmill which was erected during the winter is being operated to its full capacity, turning out lumber for flumes to be built this summer. The company will put in machinery at its placer grounds.

MICHIGAN.

HOUGHTON COUNTY.

The Champion has present difficulty supplying sufficient rock for all three heads of stamps through the inability of the present plant to give enough compressed air. Pending the installation of the 100 drill compressor now building, the present compressor can furnish air in three shafts only at fifty to sixty pounds pressure instead of eighty. Small compressors have been set up temporarily.

The Mohawk product for March was 397 tons of refined copper—a yield of twenty-seven pounds per ton of rock stamped. The shipments to the Mohawk mill, near Houghton, aggregated 900 tons daily, being largely from Nos. 1 and 2 shafts; small shipments are made from No. 3 and also from the stock pile—estimated to contain 70,000 tons—the removal of which began recently.

MONTANA.

BROADWATER COUNTY.

At Winston the East Pacific M. Co. has been incorporated to erect an electric power plant and mill near Winston, says the Inter-Mountain. The mill will have a capacity of seventy-five tons of ore a day.

CASCADE COUNTY.

The Great Falls M. Syndicate, which recently bought the Tyler group of claims, 2 miles from Montana City, has handed the property to Jones & Martin of Great Falls for \$10,000. Development work has begun.

DEER LODGE COUNTY.

W. R. Allen has incorporated his mines at French gulch into the Allen G. M. Co. The group is 20 miles south of Anaconda. W. R. Allen, F. R. Gordon, W. H. Mahony, T. C. Davidson, P. J. Foley, W. W. McDowell are directors. The company proposes to erect a concentrator and mill this summer. Aside from that, it is incorporated to build telephone and telegraph lines.

FERGUS COUNTY.

Sapphires from the Burke & Sweeney mines at Yogo are to be cut at the mines by lapidaries. In the past sapphires from Montana have been sent in the rough to New York, Paris and London and were cut there.

FLATHEAD COUNTY.

The Montana & Spokane M. Co. has organized at Spokane, Wash. F. M. Fortune, E. Denzel and J. F. Collins of Spokane and G. Robinson of Libby are directors. They have a group of claims on Fourth of July gulch, West Fisher district, near Libby, including twelve lode claims, four placer claims, a water right and a mill site.

GALLATIN COUNTY.

The Montana Corundum Co. has closed down its mines and mills near Bozeman for the time being, owing to a disagreement among the stockholders, although they were being operated at a profit, says the Inter-Mountain.

Coal is reported from Storrs', near Bozeman, by the Washoe Co. Although the company has known there was coal underlying the hill, so far the main bed has not been found. The main tunnel has been run east in 850 feet and two side tunnels started to the north. Two small veins were cut along the line of the main tunnel. Last week the first north tunnel struck a body of coal which runs parallel with the transfer tunnel and has been crosscut for 12 feet. The washer is finished and foundations laid for the coke ovens. Work has begun on the electric plant.

GRANITE COUNTY.

The Moose Lake M. Co. has incorporated at Anaconda; T. J. Cadle, W. A. Bower, R. E. Taylor, F. W. Peckover. The company owns the Dandy and Daisy quartz claims and the Last Chance placer claim and mill, near Moose lake, near Phillipsburg. The company also owns the Abe Lincoln mine.

The Billy Maddox M. Co. has been incorporated at Missoula (Missoula county) by D. Arms, E. A. Winstanley and D. T. Conkling, to work the Billy Maddox gold mine at Royal.

LEWIS AND CLARKE COUNTY.

The East Side M. Co. of Helena has decided to build a concentrator. W. W. McDowell of Butte is vice-president.

Work has resumed on the Farmer group, in Scratch Gravel district, near Helena, and a mill will be put up.

MADISON COUNTY.

W. M. Brown, directing engineer for the Bismarck & Nugget G. M. Co., operating near Sheridan, reports the plans of the company will involve spending \$100,000 this summer in building a plant for treating the ores and developing the mines at Brandon. The gallows-frame for the hoist is up.

PARK COUNTY.

Manager G. T. Wickes of the Livingston Coal & Coke Co. says their mines near Livingston will be reopened and the coking plant started up again. Pumping machinery will be put in.

SILVER BOW COUNTY.

Fire at Farrell shaft No. 2 of the Pittsburg & Montana M. Co. at Butte destroyed the boiler house and engine house and damaged the gallows frame on the 18th inst., says the Inter-Mountain.

There are being worked in Butte four mines below the 2000-foot level and the veins are as strong and as rich as the formation encountered at 1000 feet. The deepest shafts are the High Ore, Diamond, Green Mountain and Consolidated. Shafts on several other properties which have reached close to the 2000 mark are the Never Sweat, 2000 feet; St. Lawrence, 1885; Anaconda, 1800; Bell, 1800; Buffalo, 1600; Parrot, 1600; East Cora, 1500, and others.

The Inter-Mountain says work will be resumed on Farrell shaft No. 3, on the flat east of the Boston & Butte smelter at Butte. Heavy hoisting machinery is being unloaded there.

F. A. Heinze of the United C. Co. is reported as saying the company produced 30,000,000 pounds of copper in 1902, notwithstanding the burning of the works, and at the present selling price of copper is earning at the rate of \$1,800,000 per annum.

NEVADA.

ELKO COUNTY.

The management of the Dexter company's mines and mill at Tuscarora has determined to recover the values in the slimes ponds that surround its plants, and to that end will this season erect a slimes cyanide plant, says Managing Director Lee, at Salt Lake City, Utah.

ESMERALDA COUNTY.

The Pine Grove G. M. Co. has been organized to unwater and develop the Wil-

son mines at Pine Grove; H. C. Cutting is president, A. L. Hudgens secretary and treasurer. A tunnel to be run 5000 feet to drain the ground and tap the Wilson ledge has been started, and also cut a series of intervening ledges. An air compressor and drills will be put in. J. W. Luke is manager.

LANDER COUNTY.

J. Kempton reports finding placer gold in the gulch west of the Avalanche mine, near Galena, and that he is making from \$2 to \$6 per day.

LINCOLN COUNTY.

The De Lamar Bonanza G. M. Co. has been incorporated at Salt Lake City, Utah, to develop sixteen gold-bearing locations adjoining Bamberger's De Lamar mines on the south. A crosscut has been driven 600 feet with the first ledge to be cut 200 feet ahead. L. E. Bamberger, W. W. Armstrong, J. Oberndorfer, G. C. Fetterman, H. G. Millan are directors, with G. C. Fetterman as manager.

H. A. Perkins, manager of the New Era M. Co., near Searchlight, says they will erect a 10-stamp mill this spring. This will make five 10-stamp mills in that district.

Albright, Weaver & Spencer are working several locations near Lewis' holes, 12 miles from Searchlight. They have a 4-foot vein showing free-gold values. There is also a showing of mica from which several hundred pounds of mica have been shipped. Further development work will be done to ascertain the extent and value of this find.

NYE COUNTY.

The Tonopah Home M. Co. has been organized to work 43 57 acres adjoining the ground of the Montana-Tonopah, Silver Top, Belle of Tonopah and Black Diamond companies at Tonopah. W. J. Douglass, S. A. Knapp, G. Winkler, G. W. Richard, C. M. Hooten are directors.

STOREY COUNTY.

Manager J. Ryan says he has arranged to resume on the 1600 level of the Ophir at Virginia City, working through the Sierra Nevada, Mexican and Union shafts.

Manager J. Ryan says extensive improvements are proposed in the Gold Hill mines, near Virginia City, and all of the lower workings will be supplied with electric power. The electric cable in the Caledonia shaft, which carries 2300 volts, is to be tapped at the 900 foot level and extension cables carried through the Seg. Belcher, Belcher, Confidence, Crown Point and Yellow Jacket, the power being transformed to a lower pressure for lights and driving motors for blowers, hoists, winzes, etc. Work will begin next week. When this installation is completed the use of compressed air will be dispensed with.

An electric hoist is being set up at the Andes and Utah mines, near Virginia City.

WHITE PINE COUNTY.

The White Pine C. Co. has been organized by M. L. Requa of San Francisco, Cal., to operate the Ruth group of fifteen claims near Ely. The ore is said to average \$4 per ton in gold and 3% copper.

NEW MEXICO.

GRANT COUNTY.

(Special Correspondence)—The American Con. Copper Co. will put in a leaching plant near Lordsburg. They last week shipped three carloads of ore to El Paso. W. J. Sapp is superintendent of mill and A. R. Randall is superintendent of mines.

The Comstock group in Virginia mining district, near Lordsburg, will put in power drills. A carload of ore was shipped last week to Douglas smelter. Ore runs two ounces in gold, some copper and silver. They have large bodies of low-grade ore which they are testing as to the best methods for handling. The shaft is down 230 feet. C. Yeager is superintendent. Lordsburg, April 20.

The Wild Cat group of mines at Santa Rita, 16 miles northwest of Silver City, has been bonded and leased to St. Louis, Mo., men. The method of treating ore will be changed and rollers and crushers will be substituted for the Huntington in the concentrator. H. C. Begolo of St. Louis, Mo., is interested.

The mill of the Hanover M. & M. Co. at Hanover has started up and a sampler is also in operation. They have a capacity of 150 tons of ore per day and handle gold, silver, copper and lead ores. The sampler enables the lessees and miners who are developing in that section, to bring their ores in large or small quantities to the sampler to sell them and receive cash in payment. In the Fierro district the Colorado Fuel and Iron Co. is producing 500 tons of iron ore per day, which is shipped to the Pueblo smelters by the Santa Fe railway.

OKLAHOMA.

OKLAHOMA COUNTY.

Shipments are being made by the Indianapolis Oil Co., near Oklahoma City, to the Neodesha refinery.

OREGON.

The Oregon Placer & Power Co. of Sumpter, operating between Sumpter and Granite, have begun operations for the season. The company have 200 acres of land and an 8-mile ditch from the south side of Old Baldy. The placers are in the former river bed and were opened up three years ago. Machinery has been put in and they have a bedrock flume 3 miles long.

Manager Smith of the Snow Creek mine, near Sumpter, reports ore struck in the crosscut on the west 70-foot level, being an oxidized ore. The company is planning for a 10-stamp mill and concentrator. Ore is being blocked out.

T. J. Costello, president of the Forest M. Co., operating the Storm King group in the Cable Cove district, near Sumpter, says more men have been put to work. They are sinking on the Eureka claim. At 1400 feet from the shaft on the southeast end drifting on the ledge will be started. The Storm King group includes seven full claims.

The Minersville G. M. Co., near Sumpter, will put in a hoist and pumping outfit, including two 80 H. P. boilers and a 300-gallon pump.

Manager E. W. Mueller of the Standard Con. M. Co., the consolidation of the former Standard, Willie Boy and Copper Ridge companies, says operations have begun on their properties near Sumpter this week. The first work will be to extend the Willie Boy crosscut, which is near the Willie Boy vein. This tunnel is 431 feet long, and when it reaches the Willie Boy vein will give a depth of 300 feet.

Manager L. Q. Jaquish of the American Development Co., owning placer ground near Auburn, says spring operations will begin next week. The surplus water of Elk creek has been leased and added to their other supplies, and the lower end of the Auburn flume repaired.

The Orleans management propose to place a hoist at the mine, which is near the Golconda.

F. D. Smith, manager of the Snow Creek mine, in the Greenhorn district, near Sumpter, says 164 feet of crosscut were driven last month. They are blocking out ore, getting ready for the 10-stamp mill which will be built this summer. From five sets drifted on the ledge averages of \$20 were obtained.

GRANT COUNTY.

May 1 the Hoosier Boy M. Co. will begin work at the Prairie Diggings mine, near Prairie City, says Manager F. W. Messner. The mill has twenty-five stamps, power being furnished by three water wheels, one for the batteries, another for the concentrators and light plant, and the third for the crusher.

The shaft at the Red Rock group of claims, near Gold Center, near Granite, will be unwatered and a crosscut will be run from the 200-foot level. The shaft is down 300 feet. D. Yeager is superintendent.

Baily & Gren, owning the Tahoma group, near Granite, are doing development work. They will sink their shaft and drift both ways on the vein. After exploring the shoot opened last winter a tunnel will be driven from a lower level to open the vein deeper than the shaft.

G. F. Berbridge of Spokane, Wash., last week bought the Independence group of claims, near Granite. The Independence is between the Cougar and the Magnolia groups, and comprises three full claims and three lode fractions, which have two veins, one of which is thought to be the Magnolia, and the other one of the Cougar veins. There are three tunnels 40, 65 and 275 feet on the vein and a shaft.

JACKSON COUNTY.

(Special Correspondence)—Ward & Co., the purchasers of the copper mine on the Illinois river, are sending via Jacksonville supplies and men for opening up the mine. Jacksonville, April 20.

It is locally reported the Elliott Creek copper mines in the Siskiyou mountains, near the State line, southwest of Ashland, have been sold to P. Clarke of Spokane, Wash., for \$210,000, of which \$65,000 has been paid down. Development work will begin next week. A daily stage line has been put on between Jacksonville and the mines.

The Joe Creek copper mines, 25 miles from Jacksonville, have been sold to P. Clark of Butte, Mont., for \$210,000.

JOSEPHINE COUNTY.

Superintendent J. T. Logan of the Simons-Cameron placer mine, near Waldo, says they have had a profitable run this season. The hydraulic elevator has per-

mitted of handling a large amount of gravel at less cost than in previous seasons.

At the Kremer-Palmer mine of Mt. Reuben, near Grant's Pass, a 4 stamp mill has been put in. The ledge being opened up shows 5 feet wide, carrying values in free gold.

S. Bowden of Spokane, Wash., has taken over the Free and Easy quartz mine, near Grant's Pass.

SOUTH DAKOTA.

CUSTER COUNTY.

The London & Dakota M. & S. Co. has been incorporated to work a group of claims in Penobscot district near Custer, and they own a water right on French creek. The claims are half a mile east of the Saginaw mine. J. Whitley of London, Eng., is president; T. W. Delicate, E. L. Grant-ham, C. P. T. Colmey, W. E. Mason, L. Rolland, A. C. Hastings, F. W. Lawson, W. W. Wright, M. A. Willis, A. Gibbs and C. Robinson are directors. Development has begun.

LAWRENCE COUNTY.

F. M. Wall has a lease on a group of claims, owned by L. Boswell, on Doad Dog hill, between Central City and Portland, near the head of Deadwood creek. Since beginning work he has opened up ore assaying \$40 a ton. The ground is in the phonolite belt and the ore contains values in white iron. He is driving a tunnel to cut the ledge with depth.

The Wasp M. Co. treated 3400 tons of ore at the cyanide plant on Yellow creek, near Lead, during March, recovering \$8000 in gold bullion. A new approach has been built to the mill. An incline has been cut through the quartzite from the mill to the mine, reducing the haul by one-half (700 feet) and making an all inside haul, so that weather will not interfere. The present haul is down a grade of 2%, with the exception of the last 200 feet at the mill, which is on a level, so as to slow the cars up for dumping. The ore bin at the top of the mill has been enlarged.

The University G. M. & M. Co., near Deadwood, has driven 1000 feet of tunnels and drifts on the South Dakota mine on Annie creek since taking possession last fall, and has opened up paying ore on four horizons, one of which is showing a breast of ore 15 feet thick assaying \$6. A tunnel has been started from the surface, and driven to within 75 feet of the bottom of the winze, passing through several ore bodies. The company will erect a mill of 100 tons daily capacity on Annie creek this year, to be used jointly with the Ak-Sar-Ben G. M. Co., the owner of adjoining ground.

TEXAS.

JEFFERSON COUNTY.

A careless workman kicked over a lantern at one of the Caldwell oil wells on the Hogg-Swayne tract on Spindle Top, near Beaumont, on the 15th inst., causing a fire that resulted in a property loss of \$1,000,000. There were 175 wells on the three blocks of the tract and only five of the derricks and pumps are left standing. Every company that had property in the Hogg-Swayne tract is a loser. The derricks left are on the edges of the tract. None of the companies had any insurance. No settling or storage tanks were burned, as there were none up on the Hogg-Swayne tract. The fire started near the southern edge of block 38 and spread three ways. Fifty wells probably are ruined by the dropping of tubing into them as a result of the fire. Among the losers are: London Oil & Pipe Line Co.; Caldwell Oil Co.; Spindle Top Power Co.; Central Power & Equipment Co.; Pumping Stations Dividend Oil Co.; Detroit-Beaumont; Palestine-Beaumont; Sun Co.; Advance Oil Co.; Queen City; Queen of Waco; Drummers; Alamo; Bukeye; Ground Floor; Manhattan; Borealis; Buffalo. Several pipe lines were damaged.

UTAH.

BEAVER COUNTY.

Twenty feet per day are being made in the Caotus working tunnel at Frisco, and it will require nearly a year to complete the remaining 5000 feet, says Manager M. M. Johnson. Work is being done at both ends. The working shaft has been equipped with an 80 H. P. steam hoist and air compressor. All of the tunnel work is to be done by contract. Work on the concentrating plant will begin next month. It is also the intention to resume blocking out the ore bodies down to the 600 level.

IRON COUNTY.

The Iron Mountain C. Co. have given an option on their Homestake group of fifteen claims at the foot of Iron mountain, near Cedar City, Utah, to A. B. Lewis of Salt Lake City, Utah, president of the Majestic Co.

The Colorado F. & I. Co. have bought

for \$200,000 the Taylor Estate iron mines near Cedar City, and O. M. Ladd, of Salt Lake City, the Utah representative of the company, has sixty men at work there. The Tarantula claim of Thompson & True Co. has also been sold to the Colorado Co. for \$10,000.

JUAB COUNTY.

Managing Director A. F. Holden of the United States M. Co., operating the Centennial-Eureka mine at Eureka, in his annual report to the directors at Portland, Me., last week, says the main shaft was retimbered and exploration work carried on, stopping being resumed Sept. 1, 1902. They are shipping to their smelter 250 tons a day. Arrangements have been made to sink the main shaft 500 feet deeper. When this property was bought there were two known ore channels in the mine. Development has shown three additional profitable ore channels.

Superintendent C. Parker of the Mineral Point mine, near Juab, says a 3-stamp crusher will be put in and he will concentrate the product already broken, consisting of 300 tons of 20% lead ore. The mine is opened by a tunnel. The formation is sandstone.

Salt Lake reports say H. N. Sweet & Co. of Boston, Mass., have bought a controlling interest in the Eagle & Blue Bell M. Co. properties, near Eureka, near the Grand Central and Centennial-Eureka mines.

SALT LAKE COUNTY.

At the annual meeting of the United States M. Co., operating at Bingham, held in Portland, Me., last week, Managing Director A. F. Holden's report showed, since March 1, 1900, 23,539 feet of exploration work has been done, principally in the Old Telegraph and Jordan mines, developing 1,000,000 tons of workable ore and has shown the continuity of the veins at depth. The Commercial vein has been developed. The power plant is ample for a production of 1000 tons per day. Last year the mines were connected with the Rio Grande Western railway by a wire rope tramway, 3 miles in length. Little work has been done in the Niagara mine. Certain upper levels were let out to leasers. The smelter was started up last December, and has been running with the usual vicissitude of a new plant. No metallurgical difficulties have been encountered, for the mixture of the ores of the Centennial-Eureka and United States mines has proven a profitable one, the slag losses being low. The bin capacity has been doubled; the automatic part of the dust chambers is to be extended, the briquetting plant improved, and other minor changes made. The company also owns the Centennial-Eureka mine at Eureka (Juab county).

The Davis & Gebhart group, at Bingham, is under option to W. C. Ochs of Salt Lake City for \$250,000. The group consists of 156 acres, extending from the properties of the Bingham and New Haven and Highland Boy companies on the west and north to those of the United States M. Co. on the east and south.

SUMMIT COUNTY.

F. W. Sherman, superintendent of the Daly-West mill at Park City, is making a number of improvements at the Daly-Judge mill, chief among them being the addition of a set of slime-settling tanks, also a 5 foot Huntington mill, another three-compartment jig, three more concentrating tables. It is expected with these to increase the capacity to 350 tons per day.

The work of sinking the shaft of the Lower Mammoth from the 1100-foot level to the 1200-foot is in progress. The station at the 1100-foot level is completed and the donkey hoist that was used on the 900-foot level has been set up there. From this point they will drift both south and west.

TOOELE COUNTY.

The Michigan M. Co. has been incorporated at Salt Lake City to operate near Ophir; R. L. Hammond, H. G. Twomey, J. B. Welmer.

The Four Metals M. Co., operating in the Deep Creek district, near Ibapah, will build a mill, says Manager G. L. Moats. Experiments are being made to determine the best process to adopt.

UTAH COUNTY.

The Mount Nebo M. Co. of Salt Lake City has incorporated, with A. W. Browne, H. Straw, H. M. Short as officers. The company will operate near Mount Nebo.

WASHINGTON COUNTY.

The first lot of copper bullion from the smelter at the Dixie mines, near St. George, being two carloads, was shipped last week, says Manager J. E. Beveridge at Salt Lake City. More men will be put to work in the mine.

The Paymaster group is under option to H. F. Fairchild of New York for \$90,000, and first payment was made. Machinery will be put in and the shaft

sunk from 170 feet. J. E. Beveridge of Salt Lake City is consulting engineer.

WASHINGTON.

SNOHOMISH COUNTY.

Manager Hickey of the Copper Independent M. Co., near Silverton, says machinery for the Independent concentrator is on the ground.

WYOMING.

CARBON COUNTY.

The Overland Oil & Gas Co. struck a flow of oil at Fort Steele last week at a depth of 2000 feet. They expect to find greater quantities at 3300 feet, which depth will be reached by May 5, as they are drilling from 50 to 75 feet a day.

Superintendent W. Bunce of the North American C. Co. at Rudefeba furnishes the following scale of wages for those employed at the Ferris-Haggerty mine, which corresponds with the standard scale prevalent in Colorado camps, viz: Machine men, 8 hours, \$4 a day; machine helpers, 8 hours, \$3 50; timbermen, 8 hours, \$3 50; miners (band steel), 8 hours, \$3; trammers, 8 hours, \$3; muckers, 8 hours, \$3; blacksmiths, 9 hours, \$4; tool dressers, 9 hours, \$3 50; carpenters (underground), 8 hours, \$4; carpenters (surface), 9 hours, \$4 laborers (surface), 10 hours, \$3; engineers (compressor), 12 hours, \$4. The company reserves the privilege of making special rates and arrangements in special cases.

FREMONT COUNTY.

Oil well No. 11 on the Henderson property, Popo Agie fields, 10 miles southeast of Lander, was completed last week, the drill striking the oil sands at a depth of 325 feet. Well No. 12 is down 500 feet, says Manager Henderson.

UINTA COUNTY.

A 3-foot vein of coking coal is reported struck last week 12 miles north of Cokeville. The only other coking coal deposits in Wyoming are in Weston and Sheridan counties.

It is reported at Evanston that the Union Pacific has filed articles of incorporation of an auxiliary company and will build a railroad from Hampton, on the main line, northwest to the Cumberland coal mines, thence back to the main line at Altamont. The line will be 50 miles long and pass through the oil fields, as the transportation problem has been a serious one in their development. Several companies had arranged to build pipe lines, but this will not now be necessary.

VIRGINIA.

PAGE COUNTY.

Manager T. A. Dunshee of the Virginia Con. Copper Co., operating on Hoak mountain, 4 miles southeast of Luray, says on the 120-foot level in a 230-foot drift they have a body of copper ore 40 feet wide, assays averaging 5%. They have some native copper. There are three veins of ore in the mine, dipping at such angles that they are expected to unite at a depth of 250 feet. The copper occurs mostly in the quartzite. The main shaft is down 162 feet. It is understood the company propose to erect a mill and smelter later on, says the Page Courier.

FOREIGN.

AUSTRALIA.

QUEENSLAND.

The Launceston Tin M. Co. at Herberton, during the year 1902 treated a total of 1580 tons of Launceston ore for a yield of 224 tons No. 1 concentrates and 11 tons No. 2 concentrates. The lode between Nos. 1 and 2 shafts averages 3 feet in width, carrying 12% tin ore.

SOUTH AUSTRALIA.

At Tarcoola, at the Blocks mine, the cyanide plant is completed. Rock drills and an electric plant have been installed.

In Northern Territory, at Winnecke's depot, on the Reward claim, a reef has been exposed showing a width of 6 feet of milling ore, with free gold.

BRITISH COLUMBIA.

J. W. Ross of Ymir has formed a company at Buffalo, N. Y., to take over the Empress of India group of claims, on the divide of Hall and Barrett creeks, 8 miles from Ymir. The ledge carries values in copper.

There are fifty-two men on the payroll of the New Fairview Corporation at Fairview, Okanagan, at the Stemwinder mine, stamp mill and cyanide works. In the mill forty stamps are dropping. The ore shoot at the 300-foot level is quartz with gold values.—Two shifts of men are at work in the Morning Star, in Fairview camp.

Near Wilmer the Paradise and Ptarmigan mines continue regular operations. The Paradise, owned by Toronto men, is on Spring creek, a tributary to Toby

creek, and managed by R. R. Bruce. Thirty men have been at work underground during the past year opening up the ore bodies. The mine has a vein of shipping carbonate ore which carries 200 ounces of silver and 30% lead. It also has bodies of ore carrying 30 ounces of silver and 20% lead. It is reported the company will construct a tramway to Pine creek, 5 miles from the mine, where a mill will be built during the coming summer. The Ptarmigan is on Red Line creek, a tributary to Horse Thief creek. Superintendent Starboard has thirty men underground. There are two veins, one 12 inches in width, carrying ore that runs 300 ounces of silver, one-half ounce gold and 5% copper. The second is 30 feet in width of iron pyrites carrying 2% copper, 40 ounces silver and \$4 in gold. The company has a 4-drill compressor and a sawmill. A double cable tramway is on the ground and will be put up as soon as the weather permits, to convey the ore from the mine to the compressor and millsite, a distance of 7900 feet. They will also put in an electric power plant on Horse Thief creek and transmit power to the millsite, 7 miles distant, together with a 50-ton concentrating plant. The Ptarmigan is controlled by Tiffany & Co. of New York City, N. Y.

It is reported the Western Federation of Miners at Nanaimo has extended the strike in the Dunsmuir collieries to the mines at Cumberland. This is in consequence of President Dunsmuir's refusal to meet the delegation of Ladysmith men on the 18th inst. The strike of the latter has been going five weeks. Both Comox and Nanaimo harbors are crowded with ships waiting for coal. This will leave Nanaimo the only point actually shipping coal on Vancouver Island. Between 2000 and 3000 men are affected. The stoppage of the Cumberland mines will cut off the coal supply for the Canadian Pacific liners running to China and for the locomotives on the Pacific division of that line. The miners employed by Dunsmuir struck in March because of his refusal to allow them to form a union and amalgamate with the other unions. Dunsmuir has maintained this attitude for years, but the miners thought they could successfully force the issue now because of the increased demand for Vancouver Island coal since the removal of the American duty.

H. P. Jackson, manager of the Contact mine in Burnt Basin, near Rossland, has closed down the property until the snow goes off the trails leading into the basin, as the camp ran short of supplies and more cannot be taken in until the trails are passable. When work was suspended the main vein had been opened up for 135 feet, the ledge carrying ores for its entire length. It was found impossible to proceed farther with this drift or to secure additional depth without sinking, and the facilities for bringing machinery into the Burnt Basin section are nil. They started a crosscut to the southwest to cut another known ore body. This crosscut is in 60 feet. Another 20 feet will bring the workings to the second ledge. The Contact Co. and others interested in the Burnt Basin section are awaiting the action of the Government in regard to a wagon road, and after this is built machinery may be taken in, says the Rossland Miner.

Last week sinking was resumed below the third level in the main three-compartment shaft on the Snowshoe mine, near Phoenix. A station pump was set up at the third level. The electric 150 H. P. hoist is in position at the main shaft and the transformers are being put in. The ore will be hoisted in 2-ton skips. During the several weeks the mine has been unable to ship ore, on account of the coke famine, development work has gone ahead. With glory holes, which can be worked again as the snow is gone, the mine can maintain an output of 600 tons of ore daily.

B. N. White's Slocan Star mine, near Sandon, is shipping 100 tons of crude ore a week to Pueblo, Colo., and is working thirty men.

The Active G. M. Co. of Cincinnati, O., which controls the Union Jack group of mines on Porcupine creek, near Ymir, has acquired 8 square miles of timber land near the claims. The whole area is covered with white pine, fir, hemlock and cedar. A plant will be erected, including a shingle mill of 60,000 daily capacity, which will be built at a point near the junction of the main and south forks. D. Cameron, local manager, states he expects to make enough profit on the lumbering operations to pay for the complete development of the mine. The company has put in electric drills. The power is supplied by an impulse water wheel of 50 H. P., operating a dynamo. Work is concentrated on the lower tunnel on the Queen vein, which is being run to get below the shoot found 100 feet above. This pay shoot was 5 feet wide. It consists of galena running \$7 in gold, 40 ounces in

silver, 30% lead. In the lower tunnel a streak 3 feet wide, consisting of galena and oxides, runs the whole length of the tunnel, which averages \$20.

J. Cronin, manager of the St. Eugene mine, near Fort Steele, says until some action is taken by the Dominion Government in the way of increasing the protective duty on lead the St. Eugene will not be reopened. It had been intended to start up when lead reached £13 on the London market, but the recent fluctuations have shown how unstable those prices are.

The Hall mines smelter at Nelson has resumed and 100 men are at work. Lead and dry ores are at present being handled, the supply coming principally from Sloacan and Boundary.

The Crofton smelter at Osborne bay, Vancouver Island, was blown in last week. With all the furnaces at work the capacity is 700 tons daily.

With a renewal in the coke supply operations are resuming in the Boundary. The Montreal & Boston C. Co., operating the Boundary smelter, blew in two furnaces near Greenwood last week. Manager A. I. Goodell says two more furnaces are under construction.

Construction work on two additional furnaces at the Granby smelter at Grand Forks will begin next week, making six in all, with a total capacity of 2200 tons of ore daily.

The coke ovens of the Crow's Nest Pass Coal Co. at Michel, Morrissey and Fernie are in full operation, and coke shipments have resumed.

The Thompson Placer M. Co. of Fort Steele men have started piping on their placer ground on White Horse creek, near Fort Steele. For the past month they have been putting in flumes and repairing the water ditch. The Chinese companies operating on Wild Horse creek have resumed. The Nip and Tuck Co. have put in a hedrock flume and operations are resumed.

The foreign coal shipments of the Western Fuel Co. from Nanaimo for March aggregated 17,372 tons.

The Idaho-Alamo Con. Mines, Ltd., was registered in Edinburgh, Scotland, last month for the purpose of acquiring certain properties from the Scottish Colonial Goldfields, Ltd. The Idaho and Alamo mines are near Sloacan City.

The Queen Bess, near Sloacan, closed down last week.

Last month the total output from the Bosun mine, near Lardeau, amounted to 40 tons of galena and 120 tons of zinc.

As to the recent strike in the Le Roi mine at Rosland, Manager Parish cabled to the London office: "Ore has been found in 1050-foot level west of shaft, probably Mulligan shoot; gold assays average \$16, copper 1%, small amount silver. The monthly report for February shows ore shipped 15,824 dry tons, containing 4906 ounces of gold, 12,314 ounces of silver, 525,970 pounds of copper; average value per ton, \$11.06; cost of breaking and delivering ore on railroad cars, \$2.64 per ton, while cost of development was equal to 54 cents per ton. The diamond drill has not shown the presence of any ore bodies of value. Expenditure for month on mine account was \$57,017. Northport smelter expenditure for month was \$100,037. The smelting costs for the twelve days during which the furnaces were in operation were equal to \$3.88 per ton. The February smelting costs, if reckoned on the basis of the entire expenses for the month, would amount to \$5 per ton."

Fort Steele reports say interest is being shown there concerning the probable action of the Provincial Government in relation to the question of the Flathead valley reserve on coal and oil lands. The Government has shown that it does not intend giving it to the Columbia & Western Railway Co. (i. e. the C. P. R.) by introducing a bill to confirm the order in council which cancelled the crown grant of this reserve to the company. The consensus of opinion is that it should throw the reserve open to the public after granting those applications which have already been made.

JAPAN.

Mail advices say on April 2d sixty-five lives were lost as a result of a fire at the Otu colliery, at Kinshu.

KLONDIKE.

Seattle advices say the placer and hydraulic mining interests in the Klondike are involved in a clash over the proposed Klondike water system. Placer miners claim the scheme came from men in Dawson and is intended to benefit hydraulic concessionaires, who think they will have to allow their grants to revert to the Government unless they can get water from the Klondike. The objections of the miners to the water system are that creek and claim owners would be unable to flume it by their claims without considerable expense, and bench men

would be retarded from using it because they have no dumping ground rights—i. e., they claim the introduction of such a system would mean the sudden change of the country from a placer camp to a hydraulic one. The Klondike district proper is considered good for several years yet for individual miners, provided they are not forced to hand their claims over to the companies for concessions. Placer and hydraulic mining cannot go on on the same creek at the same time, it is alleged.

MANCHURIA.

Prospectors who have gone to Vladivostok for outfits report that gold has been found at several points. The Amursky Gazette says as high as five pounds of gold have been taken from two tons of gravel.

MEXICO.

During the year 1902 the number of titles to mines of all classes of metals issued by the Government in accordance with the provisions of the general mining law of June 25, 1902, was 2247, covering 30,320 hectares of ground (74,920 acres).

CHIHUAHUA.

At Parral the Terranantes Con. Co. has ordered a complete electrical equipment for hoists, pumps and all machinery, to be supplied from a central station, says F. B. Rae, consulting engineer. Work has begun on the Caballo Prieto mine, near Parral, bonded to J. P. Hutchinson.

Manager D. J. Creel states that the copper smelter at Terrazas will be blown in by May 15.

W. P. Dunham of the Consuelo M., M. & P. Co. and F. Ashton are making arrangements to begin work on the company's property adjoining the Dolores mine, near Chihuahua.

C. A. Molson of Salt Lake City, Utah, representative of the Western Exploration Co., says an addition of 100 stamps is to be made to the mill at El Oro, making a total of 200.

Bullion valued at \$250,000 in Mexican money was the production for the month of March of the mines at Acampo. There were 102 bars of silver and gold, of which the Waterson mine had twenty-one, worth \$60,000 Mexican.

COAHUILA.

It is reported at Parras de la Fuente a vein of copper ore, 9 feet in width, has been struck in La Fraternal claim. Assays run 15% copper. The vein is in the Cerro del Oratorio, in the municipality of Parras, and is near the boundaries of Coahuila and Zacatecas. The road which leads from La Boca mine to the smelter at Viesca is a level one, and the cost of transportation over it would not exceed \$10 per ton.

Reports from the Mazopi C. Co. at Saltillo say that extensive improvements will be begun this month.

DURANGO.

The Penoles M. Co., near Mapimi, has three furnaces running steadily.

SINALOA.

A new mining district is reported being opened up 45 miles east of Bamoa. It is stated that several veins have been located carrying gold, silver and copper.

SONORA.

(Special Correspondence).—The Arizona-Mexican C. Co. of Phoenix, Ariz., owning the La Gran Proveedora de Cobre, in Altar district, have run a drift on their property 218 feet and have 110 feet of shaft. They have ore that runs 7% copper, with gold and silver values. A gasoline hoist and power drills will be put in. The group is 6 miles from Caborca and 35 miles from the Gulf of California at Port Lohos. W. E. Defty is general manager and J. Henderson superintendent.

Caborca, April 20.

The 30-stamp mill of the Crestone-Colo-rado Co. at La Colorado is handling 200 tons of ore per day. It is using eight Huntington mills in connection with the stamps. It does the coarse crushing in the batteries, finishing in the Hunting-tons. Vanners are used for concentration.

The La Sonora G. & S. M. Co. is operating its Mina Blanca mine at Suaqui Grande. This work consists of 1200 feet of tunnels and shafts. The vein is 16 feet wide—concentrating and smelting ore—with values in silver, copper, gold and lead. F. E. Dickinson is general manager and T. F. Collins superintendent. A concentrating plant will be erected and later a smelter, says Manager Dickinson.

A 125-ton smelter and refinery is being built at Toledo, 90 miles east of Torres, by the Yaqui S. & R. Co. The equipment consists of a 100x36-inch and one 36-inch circular blast furnace, and softening and calcining furnaces, etc. The plant is expected to be in operation by September. The company's mines produce lead, silver and gold ores. F. Davis is manager.

A concentrating plant and reverberatory furnaces are being put in at La Bufa

by the Bufa M., M. & S. Co. It is the plan to ship high-grade matte instead of concentrates, while at present the ores are treated by the lixiviation process: The high-grade ore is shipped. Development work is being done and a pumping plant has been put in. The nearest railroad point is 160 miles and transportation is by packing. W. Richardson is manager and E. George superintendent.

The Mexican Herald gives the following as the official report of the Cananea Con. C. Co. at Cananea, which shows the company exported during 1902, 19,830 tons of refined copper, 383,513 ounces of silver and 1115 ounces in gold, the total value of which was \$4,826,000 gold. With the improvements made in the machinery of the mines it is expected the output for 1903 will be double that of 1902.

W. G. Campbell of Detroit, Mich., has taken up the placer gold mining properties near Llano Colorado, in the southeast part of the Ures district, near Soyopa, says the Tucson, Ariz., Post, and is making preparations for hydraulic mining. He is building reservoirs by damming the creek, and will conduct the water by ditches, flumes and pipes to the giants.

NEW ZEALAND.

The comparative return, according to official statistics, of gold entered for duty for exportation from New Zealand for the years 1901 and 1902, is as follows:

District—	1901.		1902.	
	Quantity.	Value.	Quantity.	Value.
Auckland	191,968	695,551	201,583	721,977
Marlborough	133	613	601	2,404
Nelson	7,212	28,138	5,947	23,649
West Coast	113,286	454,008	118,796	475,272
Canterbury	142,922	456,833	2	7
Otago	142,940	576,492	181,116	728,114
	455,561	1,753,783	508,046	1,951,433

SPAIN.

HUELVA.

The London office of the Rio Tinto Copper Co., operating at Rio Tinto, reports for the calendar year 1902, giving the following figures (reduced to United States currency at \$5 to the £1):

	1902.	1901.	1900.
Copper, product tons	34,478	35,318	35,733
Average price standard copper per ton	\$32.170	\$33.950	\$35.733
Total profits, rents, etc.	\$7,205,530	\$9,056,750	\$9,729,060
Administration and directors.	321,170	333,915	365,935
Taxes, etc.	\$6,885,360	\$8,712,835	\$9,363,125
Depreciate, interest, etc.	\$6,121,135	\$8,006,045	\$8,779,205
Written off	\$3,089,630	\$6,990,150	\$7,765,865
Added to reserve.	\$69,320	\$91,770	\$15,535
Preferred dividend.	\$4,439,320	\$6,285,390	\$7,272,340
Ordinary dividend.	\$4,088,070	\$5,001,690	\$6,886,035
Profit	\$4,088,070	\$5,001,690	\$6,886,035
Deficit	\$3,480	\$31,510	\$31,510
Total surplus	\$117,735	\$122,225	\$110,270

The average copper contents of the 1,865,289 tons of pyrites treated were 2.51%, against 2.63% in 1901, and 2.74% in 1900—the lowest of any year in the company's history. The maximum was 3.23% in 1884. In the twenty-seven years of its operations the Rio Tinto has treated 34,575,711 tons of ore and has produced 671,771 tons of copper.

SIBERIA.

J. Rosini of the Northwestern Siberian Co. says they have a grant from the Russian Government on a tract of land along the Siberian coast, opposite Nome, of 200,000 square miles. The company was organized by Russians and a half interest sold to Americans, including M. Thompson of Seattle, Wash., T. Greenough of Idaho, F. W. Peck and J. Ramsey. Last

season several American prospectors were sent out and they found both placer and quartz deposits. Near the coast a ledge was located that can be traced for several miles, which averages 40 feet wide, carrying gold values. On two creeks less than 5 miles from the coast placer deposits were located, but they have not been developed. The prospectors are allowed to locate claims varying in length from 500 to 15,000 feet. Contracts are made with them by the company by which they pay 10% royalty to the company. During the summer three stations were built along the coast and the past winter seventy-five Americans and twenty Russians remained there. This season they will have 200 American prospectors in the country. A coal prospect was also found.

Commercial Paragraphs.

J. HAMMOND & Co., Second and Townsend streets, San Francisco, manufacturers of tanks, gallowes frames, quartz mills, etc., have shipped a complete gallowes frame, milled and painted, ready for erection, to a large mining company of Calaveras county, Cal.

On the 15th inst., the board of directors of the Allis-Chalmers Co. declared the regular quarterly dividend of 1 1/2% on the preferred stock, payable May 1st, 1903, to stockholders of record on April 25th, 1903. The preferred stock transfer books closed to-day, and will be reopened on Saturday, May 2d, 1903, at 10 o'clock A. M.

THE Keystone Driller Co. of Beaver Falls, Pa., since the fire last November, have put up temporary buildings and have turned out a number of machines. The company will rebuild their plant there on a larger scale than before. Since they began in their temporary quarters, they have filled several orders for Yukon Territory, have shipped several machines to California and have orders for St. Petersburg, Russia, and Johannesburg, S. A.

DURING the last four months the Pacific department of the Pelton Water Wheel Co. of San Francisco, Cal., report having contracts for water wheels for a number of large hydro-electric plants west of Niagara, the wheels to conform to the speed of the generators, to permit of direct connection, and the heads under which they operate are of both extremes, viz., from 65 feet to 2100 feet. Among these installations is one for the Vancouver Power Co., Vancouver, B. C., three 3000 H. P. units, each main unit to consist of two wheels, one mounted on each end of extended generator shaft—wheels to operate under a 390-foot head at speed of 200 R. P. M.; nozzles of improved Pelton combination deflecting and needle type, hydraulically balanced. The Northern California Power Co., which recently put in three 1600 H. P. Pelton wheels direct connected to Westinghouse generators, have given another order for two 3000 H. P. units to operate under 1150-foot head. By means of flexible leather link couplings, power will be transmitted from both ends of each water wheel shaft to two 1500 H. P. generators, which will run at speed of 300 R. P. M. The Gwin Mine Dev. Co., near Jackson, Cal., are installing a hoist with a capacity of 20,000 pounds at a speed of 1200 feet per minute—power derived from two 9-foot diameter Pelton wheels having triple nozzles which are fitted with two hydraulic hoist operating valves, one valve to control the three gates on each nozzle. This will exceed the capacity of the Utica hoist, which consists of two 10-foot Pelton wheels and lifts 18,500 pounds from 2000 feet depth, speed 700 feet per minute.

Catalogues Received.

A catalogue descriptive of their special design horizontal turbine is sent by the Webster Camp & Lane Co., Akron, Ohio, which contains a summary of a recent test, showing an efficiency of 84%, where but 80% had been guaranteed by them.

In nothing is the advance of science and skill more noticeable than in the present production of catalogues, and in this line nothing of late has appeared superior to the sumptuous brochure on "Mechanical Rubber Goods," sent for a notice by the New York Belting & Packing Co., Ltd., 25 Park Place, New York. It is a model in all hut regulation size. It tells in terse style just what a customer or consumer wants to know about the rubber belting, etc., that the company makes, gives tables, directions, etc., and presents all in a most attractive style. Everything about the handsome little trade treatise is first-class, the illustrations being of unusual merit. The San Francisco, Cal., office is 509 Market street.

PERSONAL.

W. H. BLOOD of San Francisco, Cal., is in Tucson, Ariz.

C. R. WORES of Tucson, Ariz., is in San Francisco, Cal.

W. S. GAGE of New York City, N. Y., is in Valdez, Alaska.

F. C. HARDON of Denver, Colo., is at La Dura, Sonora, Mexico.

W. WHELAN of Cripple Creek, Colo., is in Salt Lake City, Utah.

R. CHRISTENSON has gone to London, England, from Phoenix, Ariz.

H. G. HEFFRON of Salt Lake City, Utah, is visiting in California.

W. E. HUMPHREYS left London on the 18th inst., en route for Denver, Colo.

F. F. THOMAS, manager Gwin Mine Development Co., is in San Francisco, Cal.

I. B. HAMILTON, of Gold Hill, Or., is in San Francisco, Cal., on mining business.

W. G. FILER of Salt Lake City, Utah, has gone to California on mining business.

H. MURRAY, a mine owner of Cisco, Placer county, Cal., is in San Francisco, Cal.

W. C. OREM of Salt Lake City, Utah, is in Silver City, Idaho, on mining business.

J. KNOWLES is superintendent of the Stacy group of mines, near Rollinsville, Colo.

W. G. SCOTT, manager Queen Bess mine, Alamo, B. C., is in Salt Lake City, Utah.

P. J. HICKEY, manager of the Ivanhoe mine, near Slocan City, B. C., is in New York.

G. MOORE, of the Con. Mercur M. Co. slime plant at Mercur, Utah, is in Wisconsin.

S. R. GRAHAM, interested in oil properties near Bakersfield, Cal., is in San Francisco, Cal.

E. C. VOORHIES, superintendent Lincoln mine, Sutter Creek, Cal., is in San Francisco, Cal.

F. EISENBERGER, a mine superintendent of Nevada City, Cal., is in San Francisco, Cal.

P. S. COULDREY, manager Le Roi No. 2 M. Co. at Rossland, B. C., is in San Francisco, Cal.

E. L. BALLOU, millman, goes from Igo, Cal., to Pony, Mont., to take charge of mill work there.

J. WILCOX, superintendent of the Mass copper mine at Mass City, Mich., is in Bisbee, Arizona.

F. H. LATHRAP of Salt Lake City, Utah, has gone to Tonopah, Nev., to examine mining property.

J. NOONAN has resigned as superintendent of the Southern Nevada M. Co., near Searchlight, Nev.

A. BANKS returned to Fort Steele, B. C., last week from a trip to San Francisco, Cal., on mining business.

PRESIDENT S. BAMBERGER of Bamberger's DeLamar mines, is at DeLamar from Salt Lake City, Utah.

T. A. BROWN of Breckenridge, Colo., is in Gilpin county, Colo., examining several mines for Eastern parties.

J. A. JESTER of Boulder, Colo., is superintendent of the Northwestern mine at Caribou, Boulder county, Colo.

F. C. RUTAN of Salt Lake City, Utah, interested in the Annie Laurie mine, near Marysville, Utah, is in New York.

F. SMITH, superintendent of the Wolverine and Mohawk copper mines near Houghton, Mich., is in Bisbee, Ariz.

JUAN FELIX BRANDES, M. E., of Denver, Colo., is inspecting copper properties in New Mexico for New York parties.

E. M. HOLBROOK is general manager of the Horseshoe M. Co. at Deadwood, S. D., succeeding W. L. McLaughlin.

B. DANIELS, owning mines in Danielsville district, near Race Track, Powell county, Mont., is in London, England.

R. P. HILLS of Salt Lake City, Utah, secretary of the Four Metals and Latham M. Cos., is in Omaha, Neb., on business.

D. MCCOOK is superintendent of the Punch Creek mine on Humboldt creek, near Hawkinsville, Siskiyou county, Cal.

J. H. LE NOIR is superintendent Santa Maria mine, at Garvalana, Chihuahua, Mexico, owned by the Santa Maria M. Co.

DAVID MCCLURE, superintendent Gwin mine, Calaveras county, Cal., has returned to the mine from San Francisco, Cal.

F. H. CLARK, formerly of Salt Lake City, Utah, is superintendent of the Trade Dollar Extension mine at Silver City, Idaho.

F. MOREHOUSE returned last week to Salt Lake City, Utah, from an examination of mines in Snake River district, Idaho.

J. H. TIBBITTS, of Redding, Cal., is manager of a group of mines at Shafter, Presidio county, Texas, owned by Arkansas men.

E. H. STAGG of Johannesburg, Kern county, Cal., of the Bagdad mines near Ludlow, Cal., is in the East on company business.

G. E. PIERSON, manager Pierson group of mines near Ouray, Colo., returned last week from Cleveland, Ohio, and Kansas City, Mo.

E. R. ABADIE, superintendent of the Champion mine at Nevada City, Cal., returned this week from a trip to San Francisco, Cal.

JAMES CONSTABLE has resigned as superintendent Virginia mine, Greenhorn, Or., and will resume his mining operations in Alaska.

G. L. KAEDING AND O. C. ZINNS of San Francisco, Cal., have gone to Tuolumne county, Cal., to examine mines near Tuttletown.

J. W. GALIGHER of Salt Lake City, Utah, has gone to Valdez, Alaska, to look after his mining interests in the Copper River district.

A. A. ROSS of Prescott, Ariz., is superintendent of the Southern Nevada M. Co., operating near Searchlight, Nev., vice J. Noonan, resigned.

J. S. PALMERLEE is president and general manager of the Huachuca Con. C. Co., operating in the Huachuca mountains, near Bisbee, Ariz.

B. L. LUNCFORD of San Bernardino, Cal., formerly at the Iron Chief mine in Arizona, is assayer for the Gold Roads M. Co., near Kingman, Ariz.

W. J. SHARWOOD, E. M., left San Francisco, Cal., on the 22nd inst. for Marysville, Mont., to resume cyaniding tailings at the Drum Lummon mine.

W. A. FARISH, JR., of the Majestic M. Co. has returned to Salt Lake City, Utah, from a visit to the mines of the "Mother Lode," in Tuolumne county, Cal.

SUPERINTENDENT C. ROOD of the Ontario mine at Park City, Utah, returned last week to Salt Lake City, Utah, from a trip to San Francisco, Cal.

H. M. CROWTHER of Salt Lake City, Utah, consulting engineer of the Blue Acre Copper Co. at Blue Acre, Beaver county, Utah, is in the East on business.

A. J. OREM returned last week to Salt Lake City, Utah, from the East, where he has been in the interest of the Trade Dollar Extension Co. of Silver City, Idaho.

W. T. MACDONALD left Los Angeles, Cal., on the 11th inst., for Zapote, Chihuahua, Mexico, where he goes as superintendent Palmarejo mill and reduction works.

H. A. KELLER, consulting engineer of the Horseshoe M. Co., Deadwood, S. D., recently returned to San Francisco, Cal., from a visit to the mines and went to Mexico on mining business.

H. H. CLAUDET, representing the Elmore Oil Process, is in San Francisco, Cal., procuring machinery for a 50-ton oil ore concentrating plant, which he will put in at Le Roi No. 2, Rossland, B. C.

C. R. VAN HISE, a noted American geologist, and connected for several years with the United States Geological Survey, has accepted the presidency of the University of Wisconsin, at Madison, Wis.

T. H. OXNAM, who resigned the management of the Palmarejo mines some months ago, has been reappointed general manager of the same property, also managing director of the Huruapa mines in the same district.

F. L. SIZER, who is operating the Rosario mine, at Guadalupe y Calvo, Chihuahua, Mexico, is in San Francisco, Cal., on his way to Montana, where he is consulting engineer for the Kimberly-Montana G. M. Co., near Helena, Mont.

GARDNER F. WILLIAMS, a noted mining engineer, formerly of California, now manager of the De Beers Consolidated Mines, Ltd., owning the diamond fields of Kimberley, in South Africa, with whom he has been for the past eighteen years, is visiting in San Francisco, Cal.

H. R. SKINNER AND H. H. NOYES are in San Francisco, Cal., en route for China, to investigate the feasibility of importing 100,000 Chinese laborers to work in the gold mines of the Transvaal. Noyes says since the Boer war mining in South Africa has gone ahead rapidly, but the future development is hampered by the want of cheap labor. There is not sufficient Kaffir labor to operate the mines, and the Chamber of Mines of South Africa has undertaken to solve the labor question by looking into the feasibility of importing Chinese labor. The idea of employing white labor is out of the question. White men will not work alongside of Kaffirs. It is thought that under governmental regulations they will be able to get sufficient Chinese labor to meet the conditions. As to the capabilities of the Chinese as mine workers, in the tin mines of the Malay peninsula, which produce four-fifths of the world's supply of tin, they are employed with success. The questions involved in the scheme to import coolie labor into the Transvaal are more of a political nature. There are political objections to the importation of Chinese labor, such, possibly, as exist in the United States. They hope to secure the passage of laws in advance of the importation of any laborers, so that the whole business may be carried on under governmental supervision. The Chinese will be indentured in China and taken to South Africa for a fixed term of years, and on the expiration of this term of service will be returned.

Obituary.

H. P. GILLESPIE, a pioneer mining man of Aspen, Colo., but formerly of Denver, died on the 19th inst. in South America. He was touring the world, accompanied by his wife and two sons. In 1886 he was a candidate for Lieutenant-Governor of Colorado. He discovered the Spar mine in 1881 and was part owner of the Moffie Gibson property in Aspen district.

New Patents.

DEWEY, STRONG & CO'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING APRIL 14, 1903.

725,198.—GAS APPARATUS—D. Barnard, Bakersfield, Cal.

725,523.—GLOVE FASTENER—A. Bernauer, S. F.

725,612.—CRUTCH—G. C. Calentine, Tacoma, Wash.

725,410.—VEHICLE WHEEL—M. J. Clark, Chaparral, Ariz.

725,051.—BOTTLE—T. C. De Hart, Oakland, Cal.

725,052.—WEATHER STRIP—W. C. Dillon, Los Angeles, Cal.

725,230.—MITER FINISHER—Duncan & Byars, Norwalk, Cal.

725,087.—RAIL JOINT CHAIR—T. Elrod, Cool, Cal.

725,431.—CALENDAR—W. M. Finch, Willow, Cal.

725,340.—CALKING APPARATUS—C. G. Hightower, S. F.

725,621.—WINDOW SASHES—E. Hipolito, Los Angeles, Cal.

725,093.—WATER GATE—W. H. Kiler, Pomona, Cal.

725,348.—FOLDING CHAIR—F. T. B. Mann, Long Beach, Cal.

725,581.—GAR DOOR—D. E. McLaughlin, Tacoma, Wash.

725,463.—GAS GENERATOR—C. W. Metcalf, San Diego, Cal.

725,351.—RAILWAY TRACK—P. Montsahre, Fresno, Cal.

725,582.—MOWING MACHINE—R. L. Nevills, S. F.

725,124.—WRENCH—R. J. Northam, Hollywood, Cal.

725,184.—OIL BURNER—J. Proper, Oceanpark, Cal.

725,371.—WEIGHING MACHINE—G. F. W. Schultze, Berkeley, Cal.

725,156.—GAME—Seyfried & Sheslor, S. F.

725,518.—HOOK—J. Wahlberg, Eureka, Cal.

725,304.—RAIL BRACE—D. M. Watson, Portland, Or.

725,524.—HAT BAND—W. A. Wetmore, S. F.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

FISHERMAN'S HAT BANDS.—No. 725,524. April 14, 1903. W. A. Wetmore, San Francisco, Cal. This invention is especially designed for fishermen's use. It consists of a flexible band adapted to pass around the hat, said band forming a continuous strip or having a series of independent sections of cork or similar soft material of suitable width and thickness adapted to receive the points of hooks, so that the fisherman may carry a number of hooks and files conveniently fixed to the hat and avoid the necessity of carrying a fly-hook or other receptacle. The bands may also have clips or other devices to safely hold leaders, which may be wound around the hat.

GLOVE FASTENER.—No. 725,523. April 14, 1903. A. Bernauer, San Francisco, Cal. This invention is designed to provide a means for independently and adjustably connecting the sides of the glove opening at as many points as may be desired along the line of said opening. It consists in a

novel fastening whereby the wrist opening of the gloves may be adjustably drawn together and independently locked at different points from one end to the other, so that the gloves may be made to fit wrists and arms of varying sizes and a smooth fit maintained.

FEED WATER HEATER AND FILTER.—No. 724,661. April 7, 1903. A. de Brattville, San Francisco, Cal. This invention relates to improvements in means for purifying and heating water before it is admitted to the boiler, and it is particularly intended for use in connection with marine engines. The invention consists of a casing inclosing independent upper and lower chambers, filter compartments in the upper chamber, means for admitting water successively to said filter, through each of which it flows in downward course, connections through which the filtered water is delivered into the lower chamber, plates over which said water passes, means by which said chamber and plates are heated, and other details of construction by which the desired object is attained.

ATTACHMENTS FOR LOCKS.—No. 724,869. April 7, 1903. A. W. Livingston, Alameda, Cal. This invention relates to improvements in door latch and door lock attachments which are intended to retain the latch or bolt in a retracted position when the door is open, so that the end of the bolt will be flush with the front edge of the door, adding to the appearance of the latter, allowing the door to close easily, and avoiding the projecting points which so frequently catch and tear the clothing. It consists in a device of the character described, a housing plate having flanges at opposite sides, and a reversible drop plate pivoted interchangeably in said housing, said drop plate having an arm on its lower edge projecting from its pivoted end and movable exterior to the housing.

Latest Market Reports.

SAN FRANCISCO, April 24, 1903.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 50½c, refined (1000 fine); San Francisco, 50½c; Mexican dollars, 38 @ 39½c San Francisco, 39c New York.

A further advance in the price of silver is noticeable. The gain thus far is too small, however, to give stimulus to silver production, and no particular effort is being made to increase it.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$15.00 @ 15.25; Electrolytic, 1 to 3 casks, \$15.00 @ 15.25; Casting, 1 to 3 casks, \$14.50 @ 14.75; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £61 7s 6d spot per ton.

Copper shows no material change since last week's quotations in New York, but there was a small falling off in London. The output of copper in the Lake region in March was 17,110,000 pounds, valued at \$2,566,500.

LEAD.—New York, \$4.67½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £12 10s per long ton = 2.750 per lb.

SPELTER.—New York, \$5.70; St. Louis, \$4.60; London, £22 15s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 @ 15c.

TIN.—New York, pig, \$29.50 @ 29.75; San Francisco, ton lots, 31½c; 500 lbs., 32c; 200 lbs., 32½c; less, 33c; bar tin, \$33, 35c @ 37½c. London, £136 10s spot.

PLATINUM.—San Francisco, crude, \$18.00 @ 19.00; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$45.50 @ 46.00; large lots; London, £8 15s; San Francisco, local, \$45.00 @ 46.00; 70½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17.15c.

NICKEL.—New York, 50 @ 60c @ 1b.; ton lots, 45 @ 48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.35; gray forge, \$20.50; San Francisco, bar, 3c @ 1b., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

No. 2** 30% carload lots, 9¢; less than one ton, 11¢. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10¢ per set; 14oz., 40s., 9¢.

CEMENT.—Germania, \$2.50 @ 2.75; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50 @ 2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

COAL.—San Francisco, coast, yard prices: Wellington, \$3.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$11.50; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 56¢; cs., 61¢; raw, bbl., 54¢; cs., 59¢; Lucol oil, boiled, bbl., 50¢; cs., 55¢; raw, bbl., 48¢; cs., 53¢. Kerosene—Pearl, per gal., 22¢; Astral, 22¢; Star, 22¢; Extra Star, 25¢; Eocene, 24¢; Elaine, 24¢; Water White, in bulk, 16¢; Mineral Seal, iron bbls., 18¢; wooden bbls., 21¢; cs., 24¢; Mineral Sperm, cs., 26¢; Deodorized Stove Gasoline, bulk, 17¢; do., cs., 23¢; 86° Gasoline, bulk, 21¢; do., cs., 27¢; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16¢; do., in cs., 22¢; c; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75¢; cs., 80¢; Sperm, crude, 50¢@60¢; Natural White, 65¢; Bleached do., 70¢; Whale Oil, cs., 50¢@55¢.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 25¢@26¢ lb.; carloads, 23¢@24¢; in tins, 35¢; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 21¢@22¢ lb.; caustic soda, in drums, 3¢@4¢ lb.; Cal. s. soda, bbls., \$1.25@1.50 @ 100 lbs.; sks., \$1.05; chlorate of potash, 12¢@13¢; nitrate of potash, bbls., 10¢; caustic potash, 10¢ in 40-lb tins; borax concentrated, 7¢@8¢ lb.; roll sulphur, 4¢@6¢; powdered sulphur, 2¢@3¢; flour sulphur, French, 2¢@3¢; alum, \$2.00@2.25; California refined, 2¢@2½¢; sulphide of iron, 9¢ lb.; copper sulphate, 5¢@7¢; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66¢ B, 2½¢ lb.; nitric acid, in carboys, 8¢ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6¢; less than 500 lbs., per lb., 6½¢; in 25-lb. tin pails, 4¢ per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 4¢ per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6¢; do. in kegs, 6½¢.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6¢; less than 500 lbs., 6½¢.

LITHARGE.—Pure, in 25-lb. bags, 8¢@9¢ per lb.

BONE ASH.—Extra No. 1, 5¢@6¢ per lb. No. 1, 4¢@5¢.

BORAX.—Concentrated, 7¢@9¢ per lb. powdered, 9¢@12¢; fused, 25¢@30¢.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4¢ lb.

BORAX.—Crystal, 5¢; calcined, 25¢.

COPPER.—Sulphate, 5¢@7¢.

MANGANESE.—Pure, lb., 60¢.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

SODIUM.—Metal, lb., \$1.00.

MERCURY.—Bichloride, lb., 90¢.

PHOSPHORUS.—(American) lb., 75¢.

SILVER.—Chloride, lb., 90¢@1.00; nitrate, 55¢.

URANIUM.—Oxide, lb., \$3.50.

ZINC.—Metallic, chemically pure, lb., 50¢; dust, lb., 10¢; sulphate, lb., .04¢.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

ANALYTICAL CHEMIST DESIRES POSITION as Assayer or as Chemist in charge of cyanide plant. Thorough knowledge of cyanide process and treatment of difficult ores a specialty. Highest references. Address "Cyanide," care Mining and Scientific Press, 330 Market St., San Francisco.

A COMPETENT, PRACTICAL CYANIDE MAN, Assayer and Chemist, with thirteen years' experience, wishes position. Have built two of the largest plants in the U. S. Best of references furnished. Address "Jackson," care of this office.

COMPETENT MILLMAN, MACHINIST AND Chemist. Experience free mill and concentrating. College education. Have built and operated mills in Montana for 12 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. References the best. Address H., care this office.

CYANIDE CHEMIST OR MILL SUPT. TECHNICAL graduate. Specialty, construction; also, successful treatment of low grade ore and smelting. Good references. Address "Spanish," this office.

MINE FOREMAN WISHES A CHANGE OF position—foreman or superintendent. Age 37. Experience, 13 years. Can assay and survey State locality and salary paid. No objection to South America or Mexico. Some knowledge of Spanish. Address M. O. I., this office.

MINING SUPERINTENDENT, FOURTEEN years' successful experience in management of mine, with best of references, desires situation. Address N. F., this office.

PHYSICIAN DESIRES POSITION WITH MINING company in California. Graduate of University of California. Excellent hospital experience. Please address L., this office.

SUPERINTENDENT OR MANAGER.—MAN of 35, with fifteen years' practical experience in mining, metallurgy, an chemistry, understands handling labor, accounting, purchasing of supplies, etc., desires position. Will examine, report and develop properties. Plan and erect plants. For ten years foreman, metallurgist and superintendent of two of the largest copper companies in the West, and at present manager of a copper property in Mexico. Strong and references. Address J. G. B., care of this office.

WANTED.—A POSITION AS HYDRAULIC AND Placer Mining Foreman. Have 20 years' experience. References given if required. Willing to go to Alaska or foreign country. Address F. A. Smith, French Corral, Nevada Co., Cal.

WANTED.

Metallurgist and Smelter is open for engagement to take charge of copper property. Thoroughly experienced in mining and treating low grade ores. Position preferred in Latin America. As assayer and analyst, age 35, sl. gl. excellent references. Address "Cohre," care of Mining and Scientific Press.

WATER WORKS BIDS.

TUCSON, ARIZONA, April 30th, 1903.

SEALED BIDS, ADDRESSED TO MAYOR O. F. Schumacher, Chairman of Water Committee, City of Tucson, Arizona, for furnishing of a Tucson, Arizona, 1 Cross-Compound Crank and Fly-Wheel High-Duty Pumping Engine, with a capacity of Four (4) Million Gallons in one day of 24 hours, against a total head of 60 pounds per square inch, with steam pressure at engine throttle of 100 pounds per square inch. Pumping engine must have guaranteed duty of 115 million foot pounds, with 1000 pounds of steam with pressure at throttle of 100 pounds per square inch. Copy of specifications furnished on application, or may be seen at office Supt. of Water Dept., Tucson, A. T. Bids will be opened at 12 o'clock noon at City Hall, Tucson, A. T., Wednesday, May 20th, 1903. Bidders must furnish their own drawings for the type of engine submitted. A certified check on a responsible bank for 10% of the amount of bid, made payable to City Treasurer J. A. Legarre, must accompany each bid. The Mayor and Common Council reserve the right to reject any or all bids.

C. F. SCHUMACHER, Mayor.

F. S. TREAT, City Clerk.

PRINTING We furnish all stock and do printing at the following prices: 100 envelopes 40 cts., 500 \$1.25, 1000 \$1.75. Bill heads, note heads, cards, tags, etc., at same price. Samples of work free. Pacific Commercial Co., 325 Davis St., San Francisco, Cal.

HELP WANTED.

WANTED.—Millman for 5-Stamp Mill; one who is somewhat of a Mechanic.

Address, with references, D. A., this office.

Wanted---A Superintendent

For foundry, forge, machine and boiler shops employing 20 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answers confidential. Address Z., P. O. box 153, Station C, Los Angeles, Cal.

WANTED.

WANTED--MILL TAILINGS,

Gold, silver or lead, in New Mexico, Arizona or old Mexico. Will buy or lease fine location, quantity and value. A. E. VAN VELSAN, Telluride, Colorado. Box 181.

MINING STOCKS WANTED.

If you are a stockholder in any good going mining company and want to sell your shares

WE CAN GET YOU CASH.

Send for our price list of 500 stocks. It tells what we will buy and what we will sell.

CATLIN & POWELL, 94, 35 WALL ST. NEW YORK.

WANTED.

ELECTRICALLY DRIVEN DIAMOND DRILL

(Sullivan Drill preferred) with swinging head and pump connected, capable of drilling 300 feet, adapted for underground work, and requiring about 6 H. P., rods ranging from 1 to 5 feet. Apply 225 Crocker Building, San Francisco, Cal.

PICHER

Natural Blue Lead Paint.

Best protective paint for all iron and steel surfaces. Withstands the action of sulphuretted hydrogen gases. Send 25 cts. to cover express charges for one quart and illustrated booklet free.

Address Dept. B.

FOR SALE.

Tonopah Claims for Sale.

I have several good prospects for sale, located in known mineral belt in Tonopah mining district. Groups of 10 claims for incorporation. Claims \$100.00 to \$350.00 each. Correspondence solicited.

Address **WALTER OSBORN,**
BOX 309, TONOPAH, NEVADA.

A RARE CHANCE

to buy a complete "Merrill" Mill, as good as new, at a great bargain. Quadruple discharge; three 1000-lb. Stamps, complete battery; two sets Screen Frames; Countershaft and Boxes; two Pulleys for same; one triple-compartment O. E. Feeder; one set extra Shoes and Dies; all pipe connections; every part in first class order as mill has been used only six weeks; also 8 feet of Amalgamating Copper Plates. Price low—terms spot cash. Inquire of VICTOR MINING CO., Walker, Arizona.

FOR SALE FOR CASH OR WILL BOND.

ONE FULL CLAIM with water right and millsite. Partially developed. Prospects well in free gold. Will stand full investigation. Will deal with principals only.

Address **J. M. QUINN, Big Oak Flat, Cal.**

From Missouri.

NO. 408. FOR SALE. A thoroughly developed zinc mine in the heart of the Joplin (Mo.) zinc belt. The property is equipped with mill and is now paying unusual profit on price asked. Property can be made to pay 80% net per annum on the investment. Terms cash.

Above statements will be proved to entire satisfaction of investor.

NO. 414. A small block of the treasury stock in one of the large copper properties on the continent will be placed soon with the Exchange for sale and offered for one day only. Money required to complete reduction works. Complete reports and letters of endorsement by well known mining engineers and mining men in the United States. Full particulars to parties requiring a bona fide investment.

The Stimulus of Mining Activity.

The discovery of new mining districts is no longer the result of accident, but of the intelligent search for mineral by men trained by years of experience in this business. The prospector is a man to whom the mining world owes much. He is a man of sanguine temperament, often—usually—disappointed, but rising hopeful again he continues his search, across desert plains, through rugged mountains, and into almost impenetrable thickets. In some instances the obstructions to his progress are so great that several days are required to reach some objective point but a short distance away and within plain sight. The discoverer of the mines of Rossland, B. C., was several days in reaching the objective point of his search after having made up his mind to visit a particular red mineral-stained hill. He was hampered by fallen timber, dense thickets and deep torrents of icy cold water, but he persevered, found and located some of the best mines in the district, though he did not profit largely by his find—the discoverers of great mines seldom do.

Butler, the discoverer of Tonopah, went into the desert of southern Nevada when there was no unusual activity in that region. He went, believing that in that broad region, which had produced bonanza mines before, there still remained a good chance to make new discoveries of value. He made a discovery, the Mizpah mine, and sold out at a moderate price, sustaining the reputation the prospector has for disposing of great mines for nominal sums.

That the last great mine has been discovered in Nevada, or in Arizona, Colorado or California, or in any other great mining region no one believes, but what is required to stimulate the search is the discovery and development of a rich mine. When this occurs the immediate neighborhood is quickly scoured by prospectors who search everywhere, and take many chances which at other times would not be given a moment's consideration. Claims are located and shafts started upon nothing. That there is no surface indication is apparent, but the hope of rich veins or deposits below stimulates this class of

The Osborne Mill; First in Tonopah, Nevada. (See Page 279.)

prospecting and often satisfactory results follow.

Occasionally in old mining districts, where mining has been carried on successfully for years, a new find is announced where the existence of pay ore was not even suspected. Discoveries of this class are sometimes made in old mines, where crosscuts are driven or diamond drill holes have been bored. A discovery of this character has the same stimulating effect upon an old district that is so noticeable in a new one. And this renewed activity in an old camp can usually be measured by the value of the initial new discovery. If it is a bonanza, development is given an impetus throughout the district, and this sometimes extends far beyond the immediate vicinity of the new find. If it be of good but not of extreme value, the result of the stimulant is only noticeable locally.

Such great development as that of the gold-bearing hanket of the Witwatersrand has a stimulating effect upon the whole world, but here, too, the ratio of the value of the development to the intensifying of mining activity is proportional in the same degree that a more or less important one would be.

The extensive development, equipment and successful operation of such mines as the Homestake, Treadwell and some of the great copper mines has stimulated search for large mines which will afford a reasonable but assured margin of profit. Such operations as these have done much to place mining where it properly belongs, upon a legitimate basis, and on the same plane as other investments of equal commercial importance.

Imperfections of the Mining Law.

Mining law is based on the equity of rights, and in the United States mining laws may often be traced a similar outgrowth of existing mining laws to those in older countries. The law, generally speaking, is the outgrowth of customs more or less local in their character. Some of the most important mining laws seem to have been based upon the conception of ideal conditions as related to the geology of veins; but, unfortunately, such conditions rarely obtain in nature, and as a result we find perplexing questions involving the rights of parties in dispute. The extralateral right law is probably a more fruitful source of mining litigation than any other law, and the United States is the only country in the world in which this law is at present in force. It was tried for a short time in British Columbia, and lawsuits resulted so quickly and in such number that the law was hastily repealed, but the litigation which was the speedy outgrowth of the law in that province has not wholly been settled yet.

The law of the extralateral right evidently conceived a system of veins parallel in dip and strike, which if followed downward on their dip to indefinite depth, yet within proscribed longitudinal limits, could never give rise to conflict; yet, the law framed contemporaneously seemed to anticipate the possibility of a union of veins in depth, when the right to follow the vein beyond the point of intersection is given to the senior locator. The mining law now in force requires parallel end lines, but it does not require these end lines to be laid at right angles to either the side lines of the claim or to the strike of the vein, and herein is an additional source of trouble, as the extralateral right must be exercised in the territory lying between the end lines projected outwardly and downwardly in the direction of the dip of the vein. Adjoining claims located on the same vein may have their end lines converging toward each other, when the extralateral right will come into conflict. The Supreme Court has recently decided questions of this character in the *Cœur d'Alene* cases, where there were several conflicting rights based upon the existing law. In deciding these cases the priority of location has determined the several respective rights.

An Air-Tight Drift.

One of the latest and most novel ideas in mining has been put into practice in the Moose mine, on Raven hill, Cripple Creek, Colo. In one of the lower levels a drift was run, along the length of which fissures were cut, from which large volumes of gas appeared to issue into the workings. The miners worked with greatest difficulty, although the ventilating plant was largely augmented on the surface. The drift was timbered with square sets and tightly lagged; but these precautions did not shut off the flow of gas. Finally the unusual and ingenious expedient was tried of lining this drift from the shaft to the face, a distance of 600 feet, top, bottom and sides, with asbestos sheets reinforced with a sheeting of tin plates. This, the local press asserts, has had the desired effect of shutting off the flow of foul gas. The apparent success of this experiment suggests the possibility of holding swelling ground in the same manner. Ordinarily, ground which is found to swell in mine excavations does not do so rapidly, it often being several days before the swelling becomes noticeable, or, at least, troublesome. It is supposed to be due to the effect of the contact of the rock with the atmosphere. If, as the drift advances, the workings be lined with some substance which will hermetically seal the rock from contact with the air, the expense and trouble caused by the increase in volume of the rock may be obviated. This is not a new theory—it has often been advanced before, but until the present no attempt has been made to exclude air from contact with the rocks surrounding a drift, or for the purpose of shutting off a flow of foul gas. It is worth a trial, at all events, and in this a solution of the problem may have been found. It is not improbable a less expensive and more flexible material than sheet tin may be found. This, however, would be a matter for experiment.

Expensive Water Supply.

One of the most noted mining regions of the world to-day is in Western Australia, about the region known as Kalgoorlie and Coolgardie. The mines upon development have proven large and rich. The ores are chiefly gold-bearing and are usually associated with tellurium. The region is arid and almost destitute of water, with a light and uncertain rainfall. The lack of water placed an almost prohibitory handicap upon extensive mining operations, but it was found in sinking shafts that often water was found, though in small amount, but this water was salt and unfit for domestic use. The Government came to the aid of the miners and established condensing plants at various places, from which water was distributed to the miners and to the towns. Realizing the impossibility, under existing conditions, of the greatest development of the mines of the region, a pumping system has been completed at a cost of over \$14,000,000. The main line is 387 miles in length, constructed of 2½-foot steel pipe. The reservoir is at Helena, near the sea, where a dam has been built which impounds 4,600,000,000 gallons of water. There are twenty stations and sixty-five pumping engines on the line. It is estimated that the operation and maintenance of the plant, with a nominal interest charge, and a sinking fund based on a twenty-year limitation, will require an annual income of about \$1,500,000. To realize this sum not less than 2,500,000 gallons of water must be sold daily at an average price of about \$1.60 per 1000 gallons. It is thought that at first the demand for water will fall somewhat short of this amount, but as extensions are made, and as irrigation is also in contemplation, the amount of water required is expected to increase beyond this. The system has a capacity of 5,000,000 gallons daily.

The miners undoubtedly will build settling reservoirs and buy only such water as is actually necessary in their operations. Ordinarily 1000 gallons of water are required to crush and amalgamate a ton of gold ore, but this varies within considerable limits. At many low-grade mines, such as are well known in America, a tax of \$1.60 per ton for water alone would be prohibitive, but in Australia the conditions are exceptional. The mines are on an elevated plateau, 380 miles from the nearest large water supply. The plant has been seven years in construction and is of large proportions, the largest in the world, though possibly not the most expensive, but assuredly the most elaborate and costly that has ever been built for mining. The mines of the region are rich and it is said by the managers that they can easily afford the additional expense—in fact, it will result in a saving of several shillings per ton in operating, and it will also admit of extending the scale of operations, which has heretofore been impossible by reason of limited water supply.

Mine Taxation.

The law taxing the net profit of mines operating in Idaho, passed by the last Legislature of that State, is seemingly in danger of being attacked—not by the miners, but by other classes of property holders, who maintain that the law discriminates in favor of the miner; that the farmer has to pay taxes upon his farm each year, whether he has a good crop or not, but that the miner, during any year that his mine fails to yield a dividend, escapes taxation. Those opposed to the law, which they claim to be unconstitutional, say a mine is property, and, being such, should be taxed, the same as any other property, whether it be profitable property or not. A mine that is unprofitable is certainly property, but of a most undesirable kind. If the ores within a mine can not be made to yield a profit, abundant and timely rains and weeks of sunshine do not render it more profitable. The only hope of realizing a profit is by the expenditure of more money for the purposes of further development or extension of plant, when success may ultimately result. Although the mining wealth of a nation is its mainstay and the real basis of its prosperity, there are few laws which favor the miner as against other classes. Usually the miner is the one who has to shoulder the load, and upon him is placed the burden of proof as against his agricultural neighbor.

Immigration and the Miner.

The report of the Immigration Commissioner, recently issued, shows that the total immigration into the United States for the nine months ending March 1 last was 494,425, as against 370,575 for the corresponding months of last year. Of this large immigration, Italy supplied the largest number, the total (including Sicily and Sardinia) being 129,800. The next largest contingent came from Austria-Hungary, which contributed 123,234, and Russia (including Finland) sent 81,731. Every country in Europe sent its quota, and some Asiatic countries, notably Japan, are represented. However, a large number of these immigrants are of a desirable class, but the vast hordes from Italy, Austria-Hungary, and Finland are the least desirable element. The greater number are abjectly poor, and as a large percentage of them go to the mining regions of the United States the subject is of interest to miners, not only native born but naturalized citizens. Everywhere miners are organized or organizing for higher wages, shorter hours and improved conditions, but how these can be maintained when once secured—at the cost, generally, of a struggle—seems difficult of solution. These people must live, now that they are here, and to live they must obtain work, but a high standard of wages or work can not be maintained when the labor market is continually flooded with the class of laborers here referred to.

In connection with this may be mentioned the fact that during the recent labor demonstration in Amador county, Cal., a number of men marched in the processions which paraded the streets who were unable to speak or understand a word of English, and still wore the tags which are secured to their coats when they first reach America, showing them to be among the latest to arrive.

These men know nothing of our form of government, our laws, or our institutions, but they are already or soon will become competitors in the labor markets, and in the face of this condition, which does not improve in the least with time—indeed, threatening to get worse—no standard of wages that an American can afford to accept will long be possible.

Decision in Seven Stars Case.

The Supreme Court of the United States has decided the long contested case involving the ownership of the Hillside mines, in western Yavapai county, Arizona. In 1891 John Lawler and associates sold the group of mines, of which the most important was the Hillside claim, for \$450,000. The deed was placed in escrow, the money to be paid in installments to the owners of the property. A large cash payment was made and the purchasers incorporated as the Seven Stars Mining Co. It was extensively advertised, both in America and Europe, and a large amount of stock sold on excessive capitalization. It was alleged by the stockholders that the prospectus contained many misstatements, and an effort was made to hold Lawler and Wells, who were the principal owners of the property at the time of the sale, responsible for the misstatements made by the promoters of the company. The Supreme Court of Arizona decided the case in favor of defendants, and the case was appealed to the United States Supreme Court, which has now affirmed the opinion of the lower court, the court holding that Lawler and Wells were not cognizant of the misrepresentations made by the promoters; and even had they been informed on the subject, they could not have been held responsible. The decision is important, as it releases a valuable mine from the bonds of litigation and establishes a precedent by which others may be guided.

WHAT the intending investor in a mine wants to know is, how much metal the ore contains, the amount of ore available, the cost of mining and of reduction, and the probable length of time required to exhaust the visible supply. He cares little about the genesis of the ore deposit, how the gold or silver or copper or other metals came into the ore. He wants to know how to get it out in the shortest possible time at the least possible cost. If promoters' reports dealt more with substantial, pertinent facts and less with fancy and unnecessary scientific information, the man with the money and he could more quickly come to an understanding.

CONCENTRATES.

A 3-FOOT water wheel under 1000 feet head, with 221.15 miner's inches, will develop 534 H. P. The wheel will run at 807 revolutions per minute, the spouting velocity of the stream being 15,216.89 feet per second.

A NOZZLE may be directed to either the top or bottom of an impact water wheel to drive the wheel in a given direction, but in directing the stream to the top of the wheel there will be a loss of head equal to the diameter of the wheel.

By ferro-concrete is meant concrete formed of broken rock, sand and cement, reinforced by iron bars of various shapes or sizes. Wire introduced into concrete pillars and walls is said to add largely to its strength; particularly is this the case with pillars wrapped around with wires.

DAHLONEGA, Ga., was one of the earliest gold mining districts in the United States. Early miners in California learned from Georgians the rudiments of placer mining, but the inventive genius of the Argonauts quickly devised better methods than those of early mining in Georgia.

MINING or other corporations organized in any State or territory of the United States may incorporate under the laws of any other State or Territory. There is considerable difference in the corporate laws of the several States, particularly as related to assessments and personal liability of stockholders.

WHERE two placer claims adjoin, each owned by the same person or association, the annual assessment work may be done on one of these claims for the benefit of both. If \$200 worth of work is performed on the lower claim it "represents" both, whether the claims were acquired by location or purchase.

AMALGAM RETORTS sometimes burst, but the cause is not always easy of determination. In some instances it has been thought to be due to moisture in the amalgam creating steam, but mercury when vaporized is a gas, with the same expansive tendency as steam, and is as likely to cause an explosion or disruption of the retort as steam.

THERE is an atmospheric pressure reduction of about one-half pound per square inch for every 1000 feet of ascent. The losses at high altitudes, for which allowance should be made in installing an air compressor, are about 7% for $\frac{1}{2}$ mile, and 34% at 2 miles. At that height the atmospheric pressure per square inch is 9.88 pounds, at sea level 14.7 pounds.

IN Spanish American countries most of the placer mining done by the natives is with the batea, a shallow wooden bowl. With this in hand they stand in the water of a stream and scoop up the sand from beneath the water, quickly washing away the debris, the gold accumulating in a small depression in the center of the batea. Sluicing is with them almost unknown.

AMALGAM coming from stamp batteries is never clean. It always contains pieces of steel and iron and fragments of detonating caps from the mine, as well as many other substances derived from various sources. The small particles of iron and steel worn from the shoes and dies also work into the amalgam, which should be thoroughly cleaned before retorting, or the grade of bullion will be unnecessarily low, for it is difficult to slag off all of the foreign substances included in the gold sponge.

THE gold-bearing alluvials of the Gold Coast, West Africa, extend over a district covering several hundred square miles. The upper benches have mostly long since been exhausted by the natives, who worked in a primitive way. The stream deposits are from 20 to 40 feet deep. The bedrock is overlaid by strata of gravel and sand, which are gold-bearing, but the later alluvial deposits, consisting largely of loam and decomposed organic matter, is not gold-bearing. The stream beds are prospected by boring holes to bedrock. These mines are in equatorial Africa and the climate is hot and unhealthy.

THE safe working pressure of a boiler is calculated by taking a strip 1 inch lengthwise of the shell, thus forming a ring 1 inch in width, determining the load that it will safely carry, and assuming that every other ring 1 inch wide in the shell is just like it. This may be objected to by some engineers, because a ring might be selected that will come directly through a rivet 1 inch in diameter, and it may be argued that, therefore, such a ring will not have any strength; but this does not hold good because the next ring will not be cut at all; therefore its full strength would be retained, so that taking them both together will show what the average is.

ORBICULAR DIORITE is a variety of diorite, of peculiar structure, where the minerals constituting the rock are arranged in the form of concentric rings about a central mass, or kernel, which usually consists of either the feldspar anorthite or hornblende, or a mix-

ture of both. The spheres are from 1 inch to 3 inches in diameter, a section showing alternately rings of dark and light colors. It is a rock of comparatively rare occurrence. It differs from ordinary diorite chiefly in structure, being essentially of the same composition as normal diorite. Augen gneiss differs from the diorite above described, both structurally and mineralogically. The name augen gneiss is applied to a variety of gneissoid rock in which occur crystals of feldspar having the appearance of eyes.

NO VALID MINE LOCATION can be made without a discovery. Where the underground workings of a claim determine the existence of a vein which does not appear upon the surface of adjoining ground, and it is desired to locate this ground, it is well to make the location, though at the risk of the locator, and continue the underground development of the neighboring claim, following the vein into the undeveloped ground. As soon as the workings have passed the line a valid location may be made on the unoccupied ground, but up to that time any location made would not stand as against another who might discover a vein apexing on this ground. The law does not require that a vein or deposit of payable mineral be discovered, but mineral-bearing rock in place.

MOHAWKITE, mentioned in Mining Summary April 11, is an arsenide of copper which occurs and is mined in the Mohawk copper mine, near Houghton, Mich. It is massive (no crystallization has been observed), and fine granular; the fresh surface color is gray with yellow tinge, tarnishes easily to ultimately dull purple (color, however, not a guide to its identification); brittle; hardness, approximately 3.5; specific gravity, 8.07. In closed tube gives no sublimate of arsenic, melts at cherry red, coloring glass blue (Co); on charcoal in oxidizing flame, copious fumes of As_2O_3 , odor of arsenic, finally giving a globule of metallic copper. Plattner's test for metallic arsenides shows also the presence of cobalt, nickel and a trace of iron. Composition—Cu, 61.67%; Ni, 7.03%; Co, 2.20%; Fe, trace; As, 28.85%, l. e., (Cu, Ni, Co) $_3$ As. Mohawkite is dissolved by nitric acid, but not by hydrochloric.

AS BETWEEN BLAST FURNACES and reverberatory furnaces the blast furnace has been recommended in the case of highly ferruginous ores, or where the cost of anthracite, coke or charcoal is not much greater than that of bituminous coal, wood or any other fuel fitted for the reverberatory furnace only; also for oxidized ores, low grade native copper ores and where clean slags are a necessity. The reverberatory furnaces, on the other hand, have been similarly recommended in the following cases: With highly refractory, siliceous, aluminous, calcareous or magnesian ores; where the composition of the ore changes suddenly and greatly; where bituminous coal or wood or other reverberatory fuel is much cheaper than anthracite or coke; for smelting and immediately refining rich native copper ores; its disadvantages in yielding richer slags than the blast furnace weighing less heavily in case of rich ores.

IN a water-power plant different heads cannot be employed in one pipe line nor on the same wheel, but two or more wheels may be run on the same line of shafting under different heads by proportioning the diameters of the wheels to the respective heads. Under high heads, where regulation is required, it is often advisable to use a deflecting nozzle, which admits of a variation in power without change in pressure or volume of water used, in this manner relieving the pipe line of the shock caused by "water hammer" when the flow is suddenly checked. In a plant of this description the most economical results are obtained when the gate is wide open and the diameter of the nozzle of such size as to give the necessary power. When, from any cause, the supply of water is diminished, the size of the nozzle should be reduced to maintain a full pipe line.

THERE are no extralateral rights in Leadville, Colo.—the only district in the western United States where this condition obtains. The reason for this is found in the fact that no Lake county jury has yet been impanelled that would admit the existence of an "apex" in the mines of the district, a distinction being made between ore deposits filling fissures and fissured zones, and those resulting from metasomatic deposition in sedimentary strata, which latter are not there recognized as veins, and consequently as ore deposits without "apices." This was the customary finding in each case, and became an unwritten law, as it were, of Leadville. While these ore deposits are veins or lodes within the meaning of the law, the question was always negatived by the local juries. Decisions rendered under the existing conditions in Leadville were confirmed by the United States Supreme Court.

WHERE a vein is discovered in a shaft, by intersecting the vein on its dip, and the apex of the vein, which may be "blind"—that is, covered by a later deposit of alluvial, lava, or other material—lies outside the side lines of the locator's claim, this locator gets no extralateral right, being entitled only to that portion of the vein lying within his lines. Moreover, a junior locator who takes a claim within which the apex of the vein lies may take his extralateral right, depriving the senior locator, whose discovery was made on the dip of the vein, of all of his rights, unless the locator of the apex has made his discovery upon railroad or agricultural patented land. In

this latter event he loses his extralateral right. It has been argued that the court may construct a new apex at the point where the vein passes outside the patented land, which the senior locator may consider as his apex, and from which he is entitled to all the rights belonging to an ordinary apex locator.

WHERE the respective merits of single and double-handed drilling have been tried it has usually resulted in favor of the single-handed method, but it is not always expedient to make the test of the single-handed work where it is necessary to employ men accustomed to double-handed drilling, in competition with other double-handed drillers. Two double hammers on a drill are sometimes resorted to on hard rock, but it is doubtful if this is profitable unless the men are working on contract. In hard rock machine drills will give better satisfaction and prove more economical in the end. In counting the cost of machine drill work, in addition to labor, explosives, etc., must be figured cost of compressing air, interest on cost of compressor plant, pipe line, etc., as well as deterioration and repairs. Compressors of large capacity are more economical than small ones, if there is sufficient work to economically employ the large compressor.

METAL MINES as well as coal mines produce carbonic acid gas, though more rarely the inflammable "fire damp." In some instances the carbonic acid gas has been so abundant that the mining work has had to be abandoned. This was the case in a long drift from a deep shaft at the New Almaden, Cal., quicksilver mine. Subsequently an air-tight bulkhead was built in the drift, and pipes placed connecting an air compressor at the surface with the bulkheaded drift. The intake of the compressor was attached to the pipe leading into the mine, the carbon dioxide was drawn from the mine and by means of special machinery compressed into steel cylinders under a pressure of 1200 pounds per square inch, in which form it was sold for the carbonating liquids. The Abbott quicksilver mine in Lake county, Cal., makes a large amount of "fire gas" similar to the "fire damp" of coal mines. The occurrence of fire damp in metal mines is unusual. In the case of the Abbott mine its presence is supposed to be due to the bituminous matter in the surrounding rocks.

UP to the time of the discovery of diamonds in Brazil, the principal diamond producing region was that of southern India, which included the Golconda mines. The diamond district in Brazil is near Diamantina, in the province of Minas Geraes, where diamonds were first found in the streams, and later were traced to conglomerate beds near the summit of the mountains in which they occur. The original source of the diamonds of Brazil has not been discovered, unless the conglomerate proves to be the original matrix. The production of diamonds in Brazil at present is relatively small. The largest diamond ever reported was that known as the Excelsior, found at Jagersfontein, South Africa. It weighed 971 carats, and was 3 inches thick in its greatest diameter. Diamonds have also been found in meteoric iron. Graphite, when pure, is like diamond, pure carbon but usually contains impurities, chiefly iron and clay. Although apparently soft, graphite wears the steel saws employed to cut it, with astonishing rapidity.

APPLICATION for patent for a mining claim may be made by filing in the proper land office an application for patent, and showing compliance with all the requirements of the law, together with a plat and field notes of the claim, or claims in common, made by or under the direction of the United States Surveyor-General, showing accurately the boundary of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with notice of such application for patent, and shall file an affidavit of at least two persons that such notice has been duly posted as aforesaid, and shall file a copy of said notice in such land office, and shall thereupon be entitled to a patent for said land in the following manner. The Register of the Land Office, upon the filing of such application, plat and field notes, notices and affidavits, shall publish a notice that such application has been made, for the period of sixty days, in a newspaper to be by him designated as published nearest to said claim; and he shall also publish such notice in his office for the same period. The claimant, at the time of filing his application, or at any time within sixty days of publication, shall file with the Register a certificate of the United States Surveyor-General that \$500 worth of work have been expended, or improvement made upon the claim by himself or grantors, that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnish an accurate description, to be incorporated in the patent. At the end of the sixty days' publication the claimant shall file his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during said period of publication. If no adverse claim shall have been filed with the Register and Receiver of the Land Office at the end of sixty days' publication, it shall be assumed that the applicant is entitled to patent, upon the payment to the proper officer of \$5 per acre, and that no adverse claim exists, and thereafter no objection from third parties to the issuance of the patent shall be heard, except it shall be shown that the applicant failed to comply with the provisions of the act.

Treatment of Oxidized Silver-Lead Ores of Aspen, Colo.

Written for the MINING AND SCIENTIFIC PRESS by S. I. HALLETT, Silverton, Colo.

In the low-grade ores of Aspen, Colo., lying along the great contact that has produced so many millions of dollars, two things have been demonstrated:

First, that the unoxidized ores, as a rule, concentrate by water very excellently, some of the best work of the country having been done in this camp. The oxidized ores do not concentrate at all, saving only from 35% to 50% of their values in silver and lead.

As a general proposition, in the low-grade ores of Aspen the black ores will concentrate, the red ores will not. As there is an enormous amount of these oxidized ores, extending several miles, that are at present unavailable, I have been for some time very much interested in a method of treatment that would handle them to advantage, speaking commercially, and it seems at last as though I had found a method that, followed up in certain instances, might be of great benefit to the ores in this camp.

The tests which I enclose were all made by H. A. Guess, assayer and chemist of the Silver Lake mines, in the San Juan country, and were made with great care and from various types of ores. For his thoroughness and interest Mr. Guess is entitled to the credit, if any, of working out these results.

While it is true that these are but laboratory tests, at the same time the results on these oxidized ores are of enough importance to demonstrate that the experiments are worth carrying further.

The general proposition of these silver-lead-iron ores is to treat your raw ore with cyanide, getting that loss in silver that results from water concentration and saving it, and then concentrating the tailings from your cyanide tanks so as to save your lead with the remaining silver values.

Below are the results of the experiments in detail that would undoubtedly be of great interest to those working in Aspen on ores of this class:

MEMORANDUM OF TESTS ON ASPEN ORES.

No. 1—Lime ore from an old lead stope at bottom of shaft, first level.

No. 2—Talc ore, talc shoot, from levels two, three and four.

No. 3—Iron ore, from fourth level, north.

No. 4—Iron and spar ore, 400 feet down the incline.

Partial Analyses.	No. 1.	No. 2.	No. 3.	No. 4.
Ag.....	14.5 oz.	8.7 oz.	12.3 oz.	6.8 oz.
Au.....
Pb.....	4.0 %	5.8 %	4.8 %	2.5 %
Cu.....	0.02%	...	0.03%	0.08%
Zn.....	1.70%	...

S.....	0.80%	1.52%	1.64%	1.73%

NOTE—Where ... are given in the analyses it means not determined, except in the case of gold.

CYANIDE TESTS BY PERCOLATION ON THE RAW ORE.

No. 4—700 grams at 20 mesh, 700 c.c. of 0.5% KCy solution; time, 10 days. Assay of residues, 0.92 oz.; extraction, 86.5%; KCy consumption, 7 lbs. per ton. Detailed tests were not made with this ore, as it was too low grade to consider. The rate of leaching was very fair.

No. 2—710 grams at 20 mesh, 750 c.c. of 0.50% KCy solution; time, 40 hours. Residues assayed 4.3 oz.; extraction, 50.5%; KCy consumption, 6.21 lbs. per ton. Rate of leaching very slow. Detailed tests were not entered into with this, for reasons as above.

No. 1—710 grams at 20 mesh, 750 c.c. of 0.50% KCy solution, or 10 lbs. solution; plain ore, no lime added; time, 40 hours. Ore assayed 14.5 oz., residues assayed 5 oz.; extraction from residue assay, 65.4%; extraction by actual recovery from solution, 65.5%; KCy consumption, 3.4 lbs. per ton. Screenings of residues gave: 43% on 80 mesh, 6.9 oz.; 52% through 80 mesh, 3.2 oz. Screenings of original ore gave: 48% on 80 mesh, 13.3 oz.; extraction, 62.8%; 52% through 80 mesh, 10.3 oz.; extraction, 70.4%.

No. 3—710 grams at 20 mesh, 750 c.c. of 0.5% KCy, or 10 lbs. KCy solution; time, 40 hours. No lime added. Ore assayed 12.3 oz., residues assayed 5.1 oz.; extraction from residue assay, 66.7%; extraction from actual recovery from solution, 65.9%; KCy consumption, 7.4 lbs. per ton. Screenings of residues gave: 47% on 80 mesh, 6 oz.; 53% through 80 mesh, 2.2 oz. Screenings of original ore gave: 47% on 80 mesh, 15.8 oz.; extraction, 62%; 53% through 80 mesh, 8.7 oz.; extraction, 74.7%.

MIXTURE OF EQUAL WEIGHTS OF NO. 1 AND NO. 3.

Test A—710 grams at 20 mesh, 750 c.c. of 0.28% KCy, or 5.6 lbs. KCy solution. Assay value of mix-

ture, 13.4 oz. Assays and strengths at different times during the test:

At	Extraction.	KCy Consumption.
3½ hours	5.4 oz.	2.8 lbs. per ton.
9 hours	5.9 oz.	3.1 lbs. per ton.
22 hours	6.2 oz.	4.0 lbs. per ton.
31 hours	6.48 oz.	4.1 lbs. per ton.
43 hours	6.52 oz.	4.5 lbs. per ton.

Fresh 0.30% solution run on and leaching continued.

55 hours	7.70 oz.	5.1 lbs. per ton.
67 hours	8.80 oz.	5.50 lbs. per ton.

Percentage extraction 65.7%, KCy consumption 5.5 lbs.

MIXTURE OF EQUAL WEIGHTS OF NO. 1 AND NO. 3, BUT COARSE.

Test B—710 grams at 8 mesh, 750 c.c. 0.25% KCy solution, or 5 lbs. solution. Assays and strengths:

At	Extraction.	KCy Consumption.
1½ hours	2.75 oz.	2.0 lbs. per ton.
5 hours	4.05 oz.	2.3 lbs. per ton.
10 hours	4.70 oz.	2.5 lbs. per ton.
25 hours	5.20 oz.	3.2 lbs. per ton.
34 hours	5.65 oz.	3.5 lbs. per ton.
46 hours	5.95 oz.	3.8 lbs. per ton.

Fresh 0.30% solution run on and leaching continued.

60 hours	7.12 oz.	4.40 lbs. per ton.
70 hours	8.24 oz.	4.8 lbs. per ton.

Percentage extraction in 70 hours 61.5%, KCy consumption 4.8 lbs.

ANALYSIS OF THE WORKING SOLUTION FROM TEST "A" MIXTURE, TO SEE CAUSE OF CYANIDE CONSUMPTION.

The solution showed: Fe, nil; Pb, nil; Zn, 0.035%, or 0.7 lb. per ton; Cu, 0.02%, or 0.4 lb. per ton; 0.7 lb. Zn in solution consumes 2.8 lbs. KCy; 0.4 lb. Cu in solution consumes 0.3 lb. KCy; KCy consumption due to base metals, 3.6 lbs. in 67 hours.

The silver buttons recovered from the working solutions were assayed for gold and found to have 70 part of gold to 1000 of silver.

Further detailed tests are being made on No. 1 and No. 3, alone and mixed.

No. 1—500 grams ore at 20 mesh, 2½ grams lime added, 10 lbs. per ton, 750 c.c., 9.3 lbs. KCy solution. Assay value of ore 14.5 oz. Assays and strengths at different periods of leaching:

At	Extraction.	KCy Consumption.
16 hours	7.45 oz.	3.3 lbs. per ton.
26 hours	8.40 oz.	3.5 lbs. per ton.
38 hours	9.75 oz.	3.65 lbs. per ton.
56 hours	10.22 oz.	3.8 lbs. per ton.
70 hours	10.52 oz.	3.90 lbs. per ton.
83 hours	10.65 oz.	3.95 lbs. per ton.

Extraction 10.65 oz. in 88 hours, or 73.4%; KCy consumption 3.95 lbs.

NOTE.—This has not yet been checked by residue assays, but will be.

MIXTURE OF NO. 1 AND NO. 3, EQUAL PROPORTIONS.

500 grams at 8–10 mesh, 2½ grams lime added, 10 lbs. per ton, 750 c.c., 9.8 lbs. KCy solution. Assay value of the mixture, 13.4 Ag. Assays and strengths at different periods of leaching:

At	Extraction.	KCy Consumption.
13 hours	7.15 oz.	3.65 lbs. per ton.
22 hours	7.63 oz.	3.75 lbs. per ton.
34 hours	7.87 oz.	3.80 lbs. per ton.
44 hours	8.12 oz.	3.85 lbs. per ton.
66 hours	8.65 oz.	3.95 lbs. per ton.
84 hours	9.30 oz.	4.15 lbs. per ton.
96 hours	9.66 oz.	4.25 lbs. per ton.
112 hours	10.00 oz.	4.35 lbs. per ton.

Extraction 10 oz. in 112 hours, or 74.6%; KCy consumption 4.35 lbs. per ton.

NOTE.—This has not yet been checked by residue assays, but will be.

The zinc method, as for gold, would, judging from results on gold cyaniding, consume about 1 lb. zinc shavings per oz. of bullion recovered. This in the case of silver would mean about 9c per oz. of silver recovered for zinc cost, which would be simply prohibitive.

Various schemes were tried to recover this Ag direct, and a method has been tried on a laboratory scale which promises well. It was found that by simply acidifying the dilute alkaline cyanide solution its Ag contents were completely precipitated as Ag cyanide (AgCN). Numerous tests were made to see the completeness of this precipitation, and the amount of acid necessary, and it was found to be never less than 99% of the total Ag content, and that for a 4-lb. KCy working solution it took 4 lbs. sulphuric acid, or say 1 lb. to each 1 lb. solution per ton of solution.

The silver cyanide, being granular, can easily be filtered off, and the clear acid solution containing the cyanide as HCN, and the potassium as K₂SO₄, can be reconverted to KCN by running through a bed of fresh lime, the equation being:

The calcium sulphate thus formed, being only slightly soluble in the solution, would drop out to a large extent as a granular precipitate, and would give no trouble. Several careful tests were made on measured quantities of cyanide silver-bearing solutions of known strength, going through the process

of precipitation of the Ag, and neutralization of the filtrate, and the resultant neutralized cyanide solution was found to have lost none of its free cyanide in the operations.

The silver cyanide, precipitated pure, has a little over 70% metallic silver, and with a solution similar to the one analyzed, with 0.6 lb. Zn and 0.4 lb. Cu per ton of solution, these cyanides being also precipitated, would give a precipitate carrying about 30% Ag, 20% Zn and 10% Cu, metallic.

Tests have not been tried as yet, but it is probable that this precipitate could be reduced to the metals by simple fusion. This will be tried.

Concentration tests will be tried on the residues, to see what saving can be effected on the lead contents, as well as the silver remaining, particularly in the coarse sizes.

CHECKINGS OF EXTRACTIONS GIVEN IN TESTS.

No. 1.

Assay of residue at 88 hours.....	3.25 oz.
Extraction by difference.....	11.25 oz. = 77.6%
Extraction by assay of solution.....	10.65 oz. = 73.4%

No. 1 and No. 3, mixture.

Assay of residue at 112 hours.....	3.15 oz.
Extraction by difference.....	10.25 oz. = 76.5%
Extraction by assay of solution.....	10.00 oz. = 73.4%

MEMORANDUM OF CONCENTRATION TEST ON CYANIDE RESIDUES.

	Ag.	Pb.	Fe.	Insol.
	Oz.	%	%	Res.
Residues, weight 4.5 lbs. ...	3.85	3.60
Concentrates recov'd, 9 lbs	9.00	9.20	9.80	57.60

Extraction, gross.....47.00% 51.1 %

Tailings assay.....2.55 2.10

Ratio ore : conc. : : 5 : 1.

These residues representing, approximately, 30% of the Ag and all of the Pb originally present in the ore, the gross extraction by concentration, based on original ore, would, therefore, be 14.1% Ag and 51.1% Pb, bringing the Ag extraction up to about 84% by cyaniding and concentration of the residues.

The amount run being so small, it was impossible to make a high-grade lead concentrate, and still make it a fair test for extraction.

Removing Obstructions from Drilled Wells.

To remove a fast bucket from a drilled well, knowing the inside diameter of the bucket, take a piece of

square iron that will fit the bucket tightly. Taper the iron so it will easily enter the bucket, and with a chisel cut barbs in each of the four corners. When the iron is driven into the bucket the barbs will catch, and, unless it be stuck very fast, the bucket can be drawn up.

For removing pipe, take a piece of casing about 3 feet long, rivet a piece of heavy wagon tire to each side of pipe, 3½ feet long, and bring this together at the top, fastening to a smaller pipe, to which the rope is to be fastened. By driving this down over the pipe, the latter will wedge between the side irons, and in this way the pipe can be removed. (See sketch.)

If this fails, take an old car spring or any good spring steel that is large enough to make two jars sharp on the end. Rivet these on the inside of the casing at the bottom, so that the jaws reach up inside the casing and come nearly together. When forced over the pipe the jaws will catch, and the pipe can be easily removed.

Care of Hoisting Ropes.

The proper treatment of wire ropes is as essential to their lives as that they should be of good quality and manufacture, says a writer in the West Australia Engineering Journal. When being put to work they should be put on a turntable from the outside end only, and kept tight between the turntable and drum so as to prevent injurious kinking. Overlapping on the drums should be avoided. A few feet should be cut off the cage end of shaft ropes about every four or six months. Ropes should never be worked above their proper working load—viz., one-tenth the breaking strain on the vertical, and one-seventh the breaking strain on inclines. In shafts the weight of the rope from the pulley is included in the working load. Sudden jars or jerks should invariably be avoided. All grooves of drums or pulleys, etc., should be made to fit the rope. V-shaped grooves should on no account be used. Side friction of ropes caused by their being coiled upon drums or upon themselves should be minimized as far as possible. Wire ropes should always be stored in a dry place, and if put upon the ground should have some intermediate source of protection. It should be remembered that in salt water, or under the influence of saline moisture, steel stretches. It corrodes quicker than iron. Bright steel corrodes more rapidly than varnished or dull wire. When affected by saline moisture corrosion may be accelerated by iron wire cores in steel ropes.

Copper Deposits of the Sierra Oscura, New Mexico.*

By H. W. TURNER, San Francisco, Cal.

Lying to the east of the Rio Grande, in central New Mexico, is a long N.-S. mountain range, broken into separate ridges at several points. These have received separate names; the mountains at the south end, near El Paso, being known as the Franklin mountains, and then, following successively, to the north, the San Andreas range, Sierra Oscura, Manzano and Sandia mountains.

At the eastern base of the Sierra Oscura are several low ridges, remarkable for their red color. All of these red ridges contain reefs of copper ore. The eastern flanks of the Sierra Oscura are composed of limestone. Some fossils in the limestone were examined by J. P. Smith of Stanford University, Cal., who says they are Fusulina and indicate Upper Carboniferous age. The sandstones and shales containing the copper reefs directly overlie the limestone, and are very likely of Permian age, like the similar beds in Texas.

Overlying the copper beds are red sandstones and shales in which very little copper has been found. The cupriferous zone and the red sandstones and shales are everywhere associated, and as one stands on a high point, he will see that these rocks form three main belts or lines of hills. These may be referred to as the northern, middle and southern belts.

The northern belt was not visited by me, but is known to contain copper deposits.

The middle belt has a trend of N. of W. The copper reefs have been traced for a distance of more than 2 miles.

The southern belt has a trend of about N. 30° W. The copper reefs in this belt have been traced for more than 4 miles. There are at least three distinct reefs in the southern belt which carry copper ore. These reefs dip with the enclosing sediments, similar to coal beds, so that they can be followed with great regularity for a long distance. Two of the reefs consist of sandstone containing copper glance (chalcocite) and copper carbonate in minute grains disseminated through the rock and in seams. The third reef is composed chiefly of shale, and is 2 to 3 feet in thickness, the whole of which is impregnated with minute grains of glance and carbonate. The exploitation of the region is still so incomplete that no reliable estimate as to amount of ore available for treatment can be made. None of the reefs have been exploited in depth.

Fissure veins have not been found on the north end of the belt, but along certain fault fissures of the southern part of the belt there are deposits of chalcocopyrite.

In addition to the glance, carbonate and chalcocopyrite, hornite occurs in the center of nodules which have a diameter of from 1 to 2 inches. Such nodules are abundant in shale at the north end of the southern belt. Impressions of leaves may be noted in some of the sandstone, and the copper ore has in part replaced plant stems and wood, the texture of which is still preserved.

The more massive sandstone is arkose, i. e., composed of the detritus of granitic rocks. It contains rolled grains of iron oxide (in part magnetic) up to 1/4 inch in diameter. This arkose is plainly derived from an underlying granitic area not now exposed, and it is equally clear that this granitic area contained deposits of iron ore from which the rolled grains were derived. The sandstones rich in iron do not contain any appreciable amount of copper, and the copper reefs are not rich in iron.

Two partial analyses, from carload lots shipped to the smelter, are given below:

	No. 1.	No. 2
Silica, per cent.....	65.0	65.5
Gold.....	trace	trace
Silver, troy ounces per ton.....	0.9	1.2
Iron, per cent.....	1.8	5.2
Copper, per cent.....	10.5	9.9

The shipments to the smelter were, of course, of selected ore. The average copper content of the reefs, as determined from a series of assays made by the Selby Lead & Smelting Co. of San Francisco, is about 4%.

The copper-bearing reefs can best be seen in the southern belt, because more work has been done there. At least two of these reefs, the middle and the lower, are large enough to be worked (being from 1 to 3 feet in thickness). Future exploitation may show that they exceed this thickness at many points. One deposit in the middle belt has a thickness of 7 feet. If the copper deposits of the Sierra Oscura district were in the form of fissure veins, no reliable estimate of the quantity of ore could be made without a vast amount of development work; but inasmuch as they are in the form of reefs regularly imbedded in the sandstones, an approximate calculation can be made after the beds have been followed down at a few points. All of the reefs taken together will very likely average 3 feet in thickness over many miles in horizontal extent.

No dikes or igneous rocks of any kind have thus

far been found associated with the copper reefs or the enclosing beds. They do not occupy lines of faulting, and, indeed, were certainly formed before the main faults of the district, which have caused the copper-bearing sediments to be displaced into the three belts or lines of hills above described. Small faults have caused minor displacements of the reefs at a few points. The mode of occurrence of the copper ore in regular beds, in part replacing plant remains, suggests that, like bog iron ore, the copper was deposited from the waters which deposited the enclosing sediments.

The extensive surface showing has induced considerable prospecting, and a large number of claims have been located. The climate is good, there being rains in July and August to temper the summer heat, and in the winter time the precipitation is small and the temperature not low.

The nearest railway station is Oscurito, on the El Paso-Rock Island route, about 16 miles to the east, with nearly level land from the station to the mines. There is a store and postoffice at Estey City. At Capitan, 35 miles from Oscurito, there are coal mines containing a good quality of coal, the price of which, delivered at Oscurito in single carload lots, is \$5.50 per ton. There is said to be undeveloped coal near the station, and the Estey Mining & Milling Co. has opened up a 14-inch vein to the south of Estey City. At Alamogordo, on the railroad, 22 miles south of Oscurito, there are two sawmills, supplying cheap lumber.

At Estey City an electrolytic plant has been built for treating 100 tons, or more, of copper ore per day. Having no recent information regarding this plant, I am unable to state what success they have had.

The copper carbonate is not in sufficient amount to be treated by itself by leaching, and the glance ore would require roasting with pyrite or chemicals before being amenable to a leaching process. It is probably not a good concentrating ore, as the soft glance would slime. At the time of my visit no large bodies of pyrite or chalcocopyrite were known in the immediate vicinity. The ore could, of course, be reduced in a smelter. Water is available only in wells. The Sierra Oscura is covered with nut pine.

Gold in Brazil.

The gold fields of Calcoene, Brazil, are situated near the headwaters of the Cassipore river, in the territory formerly claimed both by Brazil and French Guiana, but now belonging definitely to Brazil, and forming a part of the province of Sara. The gold region lies about 70 miles in the interior, and communication with the coast is made by a single-rail mule tramway of special design and belonging to a French company, which also owns a license to mine over the best parts of the territory.

The gold-bearing region extends over a territory of about 150 square kilometers, but it is very likely that some other areas, more or less auriferous, will yet be discovered. The first activity in Calcoene occurred in 1893-1894. Over 6000 men came and built their palm cahins and started work along the streams. They were nearly all negroes from the Guianas, with a few Portuguese, Brazilians and Americans. The period of large output lasted about four years, but it fell off suddenly. The population lessened by degrees, and nowadays only fifty to seventy negroes remain there, working in small parties of four or five.

The geology of the gold-bearing region is little known. As is often the case in tropical countries, the country rock is decomposed to a great depth by reason of weathering. Granites and quartzites abound. Diorite is also reported to exist.

In the decomposed rock at the surface there are numerous boulders of hematite and small deposits of pyrolusite (manganese oxide). Big dikes of pegmatite are often found along the beds of the gold-bearing streams.

The deposits are shallow placers of recent formation. They are limited to the actual beds of the streams, no bench gravel having ever been found. The gold-bearing ground appears to be limited to the heads of the several creeks which unite to form the Cassipore river; as they are confined to deep valleys between the hills, they are narrow and the gravel is very limited in extent, except in certain places down stream, where are found large swamps, not so rich as the upper parts, but covering a wide area.

Most of the creeks have been worked over a good many times since 1893. They have paid well, but the occurrence of gold has been irregular.

Among the most interesting of recent processes are the concentration and segregation of sulphide ores by means of the electro-magnetic separator; a similar result accomplished by means of crude petroleum; and at Broken Hill, N. S. W., the separation of zincblende from complex ores by means of a heavy salt solution. The latter is still in the experimental stage, but the separation has been reported as satisfactorily accomplished in the laboratory, where most new processes have their origin.

The Mines of Tonopah.*

Written for the MINING AND SCIENTIFIC PRESS by
WALTER OSBORN.

Tonopah is a mining camp that is attracting much attention at present. It is now entering upon an interesting period of its development.

Of its early history so much has been said that it is unnecessary to add more here. After the leasers had demonstrated the richness of the Mizpah and Valley View lodes, numerous companies were formed to develop the adjacent ground and determine the extent of the mineral belt.

As these companies had no surface indications to work on, but had to sink "blind," taking chances of finding pay ore, the progress of their development has been watched with interest by those interested in the camp's future.

The companies have been sinking day and night for months, and their shafts are now down hundreds of feet.

It has required great faith and courage to go down in this unknown territory.

During the past few weeks rich strikes have been reported in rapid succession in different mines, most of them in shafts hundreds of feet deep and far apart.

Every strike extends the known area of the mineralized zone and no one can say at this time how great its extent is.

Thus far every one who has sunk through the blue porphyry that caps the greater part of the district has encountered the pink porphyry and there found ore.

The most encouraging part of these discoveries is that in nearly all cases where ore has been found it is high grade, and the ore body is large.

The Tonopah Mining Co. has, it is estimated, several millions of dollars' worth of ore in sight and have found some of their richest ore at the lowest levels. They are down 800 feet.

A noticeable thing about the ledges in Tonopah is their size and richness combined. Many camps have large bodies of low-grade ore and others small veins of high-grade ore. But Tonopah has ledges of rich ore. The Mizpah has ledges 10 feet wide that will average over \$100 per ton.

The Montana-Tonopah has a 5-foot ledge that will average several hundred dollars per ton, and the latest strike in the Belmont-Tonopah has uncovered a large ledge in which values occasionally run into the thousands.

When one considers that comparatively little development work has been done outside of the Tonopah Co., except in a few deep shafts and short drifts, and that this limited development has given such fruitful results, future developments are looked forward to with much interest.

The writer considers the recent strike made in the King-Tonopah as important in extending the mineral belt.

The King-Tonopah is owned by the O'Meara-Lynch Co. and is located 1 1/2 mile north of Tonopah, and outside of the previously proven belt.

The discovery of ore made in the King-Tonopah shows the mineral belt to be much greater in extent than was generally supposed.

The West End struck a large ledge a short time ago which exhibits a remarkable phenomena. The ledge contains numerous fissures which are filled with gas, which, apparently under pressure, rapidly exhausts itself when one of these fissures is tapped.

In the past Tonopah has existed under the usual disadvantages of new camps in the Great Basin region, but these are rapidly being overcome. There is now plenty of water, and a railroad is soon to be built to the camp, which will lower the cost of fuel and all supplies.

The camp badly needed a reduction works to treat the low-grade ore, as there are thousands of tons of ore, worth from \$20 to \$50 per ton, that would have to be treated in the district to become profitable.

The writer solved this problem by erecting a custom mill at the wells.

The plant is known as the Nevada Milling & Reduction Works, and consists of a Kinkead mill and cyanide plant. It is already producing bullion and is at present being enlarged and adding concentrators.

Another mill will be in operation in a few months.

The ore is practically free from base metals, except manganese and iron, and mills readily. It is of much the same nature as the Comstock ore, and rich ore from the Con. Virginia of the Comstock and the Montana-Tonopah, placed side by side, look so much alike it is almost impossible to tell them apart.

The discoveries in Tonopah have resulted in other finds immediately around it. Ray, Gold Mountain and Lone Mountain are the centers of outside activity and valuable discoveries are reported from there. One little mine at Alpine, Lone Mountain, only a few months old, is netting its owners \$20,000 per month, and there are numerous other mines that have rich ore ready to ship.

Tonopah means much for Nevada. It is attracting capital and men of energy, and the State is entering upon a new era of prosperity. Nevada to-day spells "opportunity" perhaps to a greater extent than any other State in the Union.

The Late Irving M. Scott.

A great man died last Tuesday—Irring M. Scott—"the man who built the Oregon." True, other men had aided in building that vessel, but since Santiago and the world's realization of what was done there, Scott's fame filled the earth. But the building of the Oregon, or his part in it, was but an incident in his career. He did greater work in what aid he

The Late Irving M. Scott.

gave to the building of the commonwealth of California, to the advancement of man's dominance, to the uplifting and upbuilding of the material interests of the Pacific coast. And even were there space to tell of all he did in advancing those material interests as much more would have to be told of his aid to art and artistic advance, of his cultivation of literature and the finer arts that adorn life. A great man has gone and gone gladly, for he felt his work was done. In conversation with the writer ten days ago he said: "Superfluous lays the veteran on the stage. It is a mistake—this idea of long life. A man should not desire to live when he feels and knows his work is done." Eulogy or notice of his life is unneeded. He is past all praise or need of praise. Simple as all great men are he lived a life of usefulness and made the world better for having lived in it.

Death of Victor M. Clement.

Victor M. Clement, a distinguished mining engineer

The Late Victor M. Clement.

of California, died on April 26 at Saltillo, Coahuila, Mexico. He was born in Los Angeles, Cal., in 1855, and was educated in the public schools of that city,

subsequently graduating from Santa Clara College in 1876, and then took the mining engineering course at the University of California. His first practical mining experience was gained in Mexico, subsequent to which he became superintendent of the Empire mine at Grass Valley, Cal. Later he assumed charge of the Bunker Hill & Sullivan mine, in the Coeur d'Alenes, Idaho, which responsible position he resigned to join John Hays Hammond in South Africa. There he became one of the leading figures in mining and political circles. At Johannesburg he was assistant consulting engineer of the Simmer and Jack properties. Immediately after the Jameson raid Clement was one of a number of Americans and Englishmen who were imprisoned by the Boer Government for active partisanship, the leaders being charged with high treason. The friends of the Americans whose lives were thus imperiled, upon receipt of the news by cable, immediately set about securing their relief, and strong political influence at Washington was brought to bear upon the Transvaal Government. Hammond and several Englishmen were condemned to death, and Clement, with fifty others, was sentenced to life imprisonment. Efforts in their behalf were redoubled, with the result that Clement and his associates were freed upon the payment of heavy fines, when all left the Transvaal.

Returning to America, Clement became associated with the Rothschilds, and more recently with the Guggenheims, in extensive mining operations. He accumulated a large amount of money, and was in Mexico looking after his personal interests when death overtook him. In the death of Victor M. Clement there is removed from the active field of the mining world one of its brightest lights. He was a serious, earnest man, and one true to his friends. His loss will be mourned by a large circle of friends and acquaintances in America and abroad.

Factor of Safety for Winding Ropes.*

By H. C. BEHR, Con. M. E., Johannesburg, S. A.

The Transvaal Government regulations specified that the rope used for hoisting men should have permanently a breaking strength of six times the load, meaning, as I interpret the wording, that when the cross-section is reduced through wear or corrosion the rope must still have the above margin of strength. This is also, I believe, the sense of the Prussian State mining law bearing on this point. Neither law seemed to fix any initial factor of safety.

It would hardly seem practicable to provide one general factor of safety for initial strength of rope, since the conditions under which ropes work are so varied. A rope in a vertical shaft running over large sheaves and drums, especially if winding on the latter in grooves in a single layer, is subjected to very little wear; while one working in an incline shaft wears generally very rapidly. Such wear is very much less with ropes made of the harder wires which have come into use more recently. Crucible steel wires are softer and wear out more rapidly. The hardest plow-steel wires have a very high ultimate strength, and it might, therefore, seem at first that by the use of such material a higher factor of safety would not increase the weight of ropes. Wire of such hardness is, however, brittle, and would, therefore, give less security with a higher factor of safety than the plow steel of less ultimate strength and hardness at present in use.

Where the water in a mine is acid, corrosion will naturally act more quickly, and the rope in such mines should therefore have a somewhat higher factor of safety; or, what is better, the ropes should be more frequently changed. The latter would seem to be better, both from a standpoint of security and also for economic reasons, especially in deep shafts, where the extra weight of rope would require heavier machinery. It ought to be remembered, also, that wear is about proportional to the number of trips made by the rope, independent of the time, while corrosion is probably proportional to the time independent of the work done. Ropes winding in a single layer on a grooved drum wear much less than those wound on in several courses. In the latter case, also, the rope is subject to shock when it arrives at the drum flange and has to mount suddenly on top of the course just completed.

As an example of life of rope may be quoted that given by Reuleaux—a record of the 3900 feet deep shafts at the mines at Příbram, in Bohemia. These ropes were made of crucible steel, and were proportional for an initial factor of safety of 7, based on the aggregate strength of the wires, without any percentage reduction for twist or unequal strain. The above ropes made each 100,000 trips per year, and lasted, according to the author-

ity quoted, from three to four years. They were

*Communication to Chief Inspector of Mines for the Transvaal (condensed).

wound on the drum in two layers. The data from some English mines show factors of safety in one case as low as 5 and two of 5½. My informant took these data while in England recently, and states these ropes are used for hoisting men.

In view of the small influence of the factor of safety on the size of plant in winding from moderate depths, it has been urged by advocates of extremely high factors of safety that stage winding should be resorted to in order to limit the length of rope and enable the use of a high factor of safety, with the idea that then it would not much influence the size and cost of plant.

This last deduction is, however, an error, because underground hoists of large size can not generally be run by steam direct, but require to be operated through some means of power transmission like electricity or compressed air, both of which require expensive power-generating plant at the surface and costly pipe, or electric conductors to the machinery underground, so that the cost of the entire winding plant would certainly be at least doubled, especially when we consider that the cost of a large underground hoist itself alone is greater than one of equal capacity at the surface, owing to the large excavations and the necessity of making the machinery in pieces small enough and light enough to be got down through the shaft compartments. As to the two systems of transmission that might be used, it may be said that electric hoists of a large size, like those that would be required in most mines on the Rand, have not yet been demonstrated to be a complete success, and transmission by compressed air, which otherwise would afford a very manageable power, is costly to operate.

When winding in two stages is adopted, as it probably will have to be for very deep shafts, the cheapest system would, no doubt, be to lead the ropes from the second stage up to a winder at the surface. This system has been largely and successfully used for hauling along inclines starting from the foot of a vertical shaft. It has, therefore, undergone the test of actual working. For vertical shafts it has been recommended by Harbak as far back as 1878, and again brought forward at the Paris Mineral Congress of 1900. This system is suitable for only two stages, but it will be a long time before more than this will be needed. It is evident that this system will require for the lower stage ropes of a length equal to those that would be required were the winding done in one lift from the full depth, so that this useful system of deep winding would be very unfavorably affected by a high factor of safety in the rope.

Many existing plants on the Rand would also be disadvantageously affected by a higher factor of safety. There are shafts now nearly 4000 feet deep and machinery installed or purchased for winding from 4000 feet to 5000 feet depth in one lift. It would be great hardship on such mines were they forced to get heavier machinery to operate in one lift or to install additional winders so as to operate in stages. If these mines retained the use of the plants they have with a higher factor of safety, many of them would have to reduce their output, thus increasing the cost per ton of ore. If the weight of ropes were increased most of such winders would be operating more out of balance, and the negative moment which many of them have near the end of the trip would be increased. Such a negative moment is always dangerous, since it acts with the energy stored in the moving masses to keep the engines in motion, and makes it more difficult to stop them. Overwinding would, therefore, more easily occur. The greater tension in the coils of rope wound on the drum, due to the extra weight of rope, might increase the crushing strain on the metal of the drum shell, in some cases to a dangerous extent.

Inspection as to wear and internal corrosion should be frequently made. The reduction in cross-section of a rope by wear of the outer wires could perhaps be approximately estimated from measurements of the circumference of the rope compared with measurements made of the same rope before worn and after it had run for a sufficient period to bring the strands close together. It might be possible, also, to devise some means for measuring the individual wires, and thus arrive at an approximation to the cross-section. If the cross-section thus obtained should give a factor of safety less than the minimum allowed by law, the ropes should be condemned. If a single wire breaks in a rope, the total strength is only reduced very little, particularly if the rope is composed of a large number of wires. If more wires are broken, then, unless the breaks are near the same point of the rope, the strength will be reduced only in proportion to that of a single wire, because of the splicing effect for the distance which generally exists between breaks. The breaking of wires is, however, an indication of brittleness, and a rope with broken outside wires should, in the writer's opinion, be condemned.

In inclines the lower end of the rope receives the principal wear, because in descending it has to start the carry rollers into motion by friction, during which period it experiences considerable wear by sliding over the rollers. The lower 100 or 200 feet should, therefore, be periodically cut off.

A rope showing appreciable internal corrosion should be condemned. The necessary inspection for this could probably be made without injury to the

rope by a moderate untwisting of the strands at points where corrosion is suspected.

Some English and German manufacturers often recommend a very high initial factor of safety of 9 or 10 where the rope is required to last a long time. Such recommendation is often made with a view to selling a heavier and more expensive rope, and, at the same time, securing for it a long life, which fact can later be referred to for advertising purposes. For flat ropes the initial factor of safety generally used is 8 or 9, because such ropes are liable to much more unequal strain than round ones.

In view of the foregoing observations, I believe that a minimum factor of safety of 6 would be ample under any conditions for round rope, but that the length of time which the rope is allowed to be used should be decided by taking account of the conditions under which the rope operates, aided by frequent careful inspection. The cost of a rope is a comparatively small item in the general expense account of a mine. A more frequent change of a less weight of rope would also probably not cost more than that of a heavier rope, together with the extra winding cost due to its use. It is also to be considered that the management of the mines is in all cases in favor of safety rather than of long life of rope.

I would suggest, therefore, that the present minimum factor of safety be retained, but that the law be, perhaps, a little more definitely worded to make more clear the point that the ultimate strength of the rope must never during its employment in winding men be lower than six times the strain upon it. The initial factor of safety could be chosen with reference to the time that the rope may be allowed to work or the number of trips that it is permitted to make, due consideration being given to the conditions under which the rope works as to wear and corrosion.

Those ropes used for ore winding should be permitted to be employed in handling a few men whose aggregate weight is much less than the load of rock hoisted. It is often necessary to do this for shaft inspection, repairs or similar purposes.

The Elmore Process.

Written for the MINING AND SCIENTIFIC PRESS.

The successful and economical concentration of low-grade ores is always a subject of interest and importance to mine owners and operators. There are many mechanical devices in use to effect a separation of poor or worthless material from the high-grade ore, usually sulphide, associated with it in small amount. As a whole, the ore is often too low in value to afford a profit after paying expenses for mining and metallurgical treatment, and for this reason concentration is resorted to. The Elmore process is a novel and ingenious method of accomplishing the concentration of ores of this class. Reference has previously been made to this process in the MINING AND SCIENTIFIC PRESS, but no detailed statement of the method employed has been given. The plant consists of three hollow horizontally disposed cylinders of galvanized iron, 10 feet 6 inches in length and 3 feet diameter, the ends being closed excepting a central opening in each head. These cylinders are arranged one above another, vertically. Each cylinder is a counterpart of the others. Within each cylinder is a spiral diaphragm extending throughout its length. At each 90° of the circle is fixed a partition, or baffle plate. The ore, crushed wet to 30 mesh, is introduced from the crushing mill launder to one end of the machine together with the water and a quantity of crude petroleum residuum. The cylinders being mounted on carriers are driven by gearing, revolving about six times a minute. The spiral diaphragm acts as a conveyor and pushes the pulp and oil toward the opposite end of the cylinder. Its progress is broken by the baffle plates and the pulp and oil fall by gravity into the next compartment, which repeatedly occurs until the end of the cylinder is reached, when the pulp and oil have become thoroughly mixed. At the discharge end the cylinder projects into a hood which surrounds it, the lower portion being cone-shaped and filled to near the top with water. The mixed pulp and oil pours from the end of the upper cylinder into the cone-shaped hopper. The oil rises to the surface, when, curiously, it is found that the oil has taken up the metallic sulphides while seeming to have no affinity for the gangue minerals. The small particles of sulphide are enveloped within the oil. This flows automatically away and is delivered by a pipe to a large hopper situated below the lowest cylinder of the series. As may be anticipated, a complete separation of mineral is not effected in the first cylinder. The water and pulp, relieved of a portion of the sulphides, pass out of the bottom of the first cone, together with some oil, and this goes into the end of the second cylinder with additional oil, where the process of the first cylinder is repeated with a further separation of sulphides. The flow of pulp from the bottom of the cone is regulated by a valve, which maintains the proper water level. In some cases the separation is found sufficiently complete after

passing the second cylinder, in which case the power is cut off from the third cylinder and the expense slightly reduced, otherwise after passing the second cylinder the pulp, with added oil, goes through the third cylinder. The accompanying sketches show the disposition of the cylinders and separators, the location of oil tank, etc. Water, steam or electric power may be employed.

All of the sulphides separated from the pulp, and collected as above described in a single receptacle, is charged in given amount to the first separator. This is a horizontal cylindrical pan, around the upper edge of which is an inwardly projecting flange. The bottom is flat with a discharge opening covered by a cone-shaped door about the center, free to move up and down on the spindle about which the pan re-

When the amount of mineral has accumulated in the pan to a sufficient extent the machine is stopped, while the cylinders may continue to discharge into the settling tank, making the process practically continuous. The discharge door of the pan is raised and the oil and contained sulphide are washed out by means of hot water under pressure with a hose, requiring only a few minutes, when the machine is again started.

The next step is the removal of the sulphide mineral from the small amount of oil remaining and the separate recovery of both. Upon passing from the separator the oil and mineral runs to a hopper beneath the pan from which it is sent by a spiral conveyor to a second separator. This latter is similar to the upper separator, but has perforated sides, be-

Elmore Process; Plan of Plant.

volves. Hot water is first introduced to the pan when running at 1000 revolutions per minute, the centrifugal force causing the water to rise in a vertical column, which reaches from the bottom to the top and extending entirely around the circumference of the pan, being prevented from discharging over the rim by the inwardly projecting flange previously mentioned. The oil containing the mineral is then permitted to run into the pan, coming from a settling tank intermediate between the pan and the revolving cylinders, and in which any water coming over with the oil is separated. Immediately the mineral strikes the bottom of the pan the centrifugal force throws the mineral through the vertical column of water to the sides of the pan, the oil forming an inner ring against the wall of water, gradually extending to the top and flowing over the edge of the flange, and being conducted to a tank beneath the pan. An outer casing prevents the splash and waste of the oil.

ing encircled with a fine screen—100-mesh—and provided with a cover. It is operated in the same manner as the other and revolves at high speed, the centrifugal force driving the oil and hot water through the screen. This is accelerated by the introduction of hot air, which thins the viscous oil. The sulphides which are retained on the screen are removed in the same manner as from the upper separator, and being practically free from oil and moisture are ready for shipment to the smelter.

At St. Davids mine, North Wales, England, where the process has been in operation several months, the concentrates obtained by this process from tailings containing 3% copper run 8% to 10% copper, and final tailings run as low as .05% copper.

Although sulphides only are mentioned as treated by the Elmore process, free gold, copper and other native metals can be recovered in the same manner. A fifty-ton plant is to be erected at Le Roi No. 2 mine Rossland, B. C.

Milling at the Camp Bird, Colo.*

NUMBER IV.—CONCLUDED.

By THOMAS H. WOODS and GODFREY D. DOVETON.

COMPARISON OF SINGLE AND DOUBLE TREATMENT.—Referring to the grading tests, we see that the material settled in the 300-ton vat has a greater fineness than that settled in the 200-ton vats, and also slightly finer than the material caught in filling two of the 24-foot vats at once. To this fact may partially be attributed the increased extraction in the single treatment. A comparison of the results obtained on a large number of vat charges indicates that an increase of 15% is found in the quantity of leachable material deposited in a given time, and an increase of 5% in the gold extraction in 20% longer time.

At the same time there is a decrease in the labor cost of 9 cents per ton, and in the cyanide consumption of 10 cents per ton; and, taking into consideration the increase in cost of constructing a plant for double treatment, the advantages of single treatment on these tailings are so obvious that further argument would be superfluous.

The tailings are discharged by sluicing throughout the year. A pressure-pump is used in winter, however, to pump the slimy water from the dam to the hose line. With a 3-inch hose, 1½-inch nozzle, and a pressure of sixty pounds, one man can discharge 100 tons and clean the filter bottom in two hours. Bottom discharge doors are used.

THE PRECIPITATION OF THE BULLION.—The zinc used in the precipitating boxes is received in sheets, 7 feet long and 18 inches wide, costing 7.66 cents per pound, and are cut in the machine shop to a thickness of $\frac{1}{16}$ inch. A Hampton lathe is used, and, winding five or six sheets on the mandrel at once, a man can cut 140 pounds per day, about one-half pound of which is waste. The consumption of zinc per ton of ore treated is .45 pound; the greater part of this is consumed by the refining process, and but a small proportion is dissolved in the boxes. The cost of cutting the shavings is 2.7 cents per pound, bringing the total cost at the mill to 9.36 cents per pound, or 4.66 cents per ton of ore. The precipitation of the bullion offers few difficulties, and is usually very perfect. Normally the sumps carry from one or two grains to four or six grains of gold per ton. Occasionally, however, when the solution carries much copper, the degree of precipitation will be poorer, especially in the weak boxes, and cases will sometimes be observed when the weak solution has re-dissolved the precipitated gold, running out of the boxes many times higher in value than when entering.

The remedy for this is periodical flooding of the weak boxes with a stronger gold-bearing solution; frequent re-arranging of the zinc in the compartments; and, perhaps, occasionally entirely removing the zinc from the boxes, placing it in the strong boxes, and putting in its place zinc coated with a metallic film of lead or mercury. No effort is now made to prevent the depositing of the copper on the zinc with the gold, as it was found that, when pains were taken to keep the copper out of the extractors, the solutions speedily became overcharged, and eventually the copper would come down in such a strong coating that the bullion was almost if not quite excluded. The overcharging of the solutions with the double cyanide of copper has a most vitiating effect on their dissolving power, and a solution fouled in this way will take infinitely longer to make the same extraction as a fresh solution; and in some cases the same extraction cannot be approached at all, even with a prolonged contact. A solution fouled in this way is usually very low in its dissolved oxygen content, and it is probable that this influences the rate of extraction to some extent. A little copper in the solution is undoubtedly a very efficient aid in precipitation, and it is only when the copper is allowed to accumulate that difficulties are encountered here in the extractors. The sump solutions usually carry .015% to .020% copper; and, as long as this is kept fairly constant, satisfactory results ensue. An average of a number of analyses on the incoming and outgoing solutions shows:

	Per cent Cu.	Per cent Zn.
Strong gold tank solution.....	.025	.073
Weak gold tank solution.....	.0188	.036
Strong sump solution.....	.018	.0745
Weak sump solution.....	.017	.037

The solutions, before pumping to the leaching vats, are aerated for an hour. This raises the dissolved oxygen content considerably, but, on standing for some time after aeration, some of the dissolved oxygen diffuses in the atmosphere.

Estimations of the dissolved oxygen in the solution at various stages in the process are:

- (1) Solution in sump before aerating and standardizing, 2.30 milligrams per liter.
- (2) Solution as pumped to leaching vats after aeration, 7.35 milligrams per liter.
- (3) Solution after standing on vat charge for one hour, 6.80 milligrams per liter.
- (4) Solution after leaving the vat at gold tank, 2.22 milligrams per liter.
- (5) Solution after leaving the zinc boxes, 0.82 milligram per liter.

*Trans. Am. Inst. Min. Eng. (condensed).

The weak solution contains about the same amount of dissolved oxygen in all cases except when leaving the zinc boxes, where it is slightly higher than the strong solution, containing, in several cases, 1.50 milligram per liter.

CLEAN-UP OF THE ZINC BOXES.—This is made monthly. The cyanide solution is displaced by running a stream of water through the boxes, which thoroughly washes the zinc in each compartment; the fine sludge is then screened, sluiced down the side launders, and settled in the reduction vat. The remaining zinc is replaced in the upper compartments, the lower end of the box being replenished with fresh zinc, and the solution, strengthened for a few hours with a little cyanide at the head of the box, is again turned in. There is no handling of the valuable precipitates, everything being sluiced by gravity to the settling vat. When all the extractors have been deprived of their zinc-gold slimes, the vat is allowed to remain undisturbed for a few hours. The supernatant liquor being siphoned off as closely as possible, sulphuric acid (specific gravity 1.84, and costing 1.80 cent per pound at the works) is applied, with constant stirring, till all action ceases. The vat is then filled with water, settled, the liquor siphoned off into a settling tank directly under the reduction vat, and a succession of water washes applied as rapidly as possible, siphoning off as soon as sufficiently clear. The small amount of values contained in the wash settling vat is cleaned up at long intervals. It is desirable to leave a portion of the sulphates behind, in order that a regulus or matte may be formed in melting. A considerable quantity of the copper is matted off in this way, leaving a comparatively fine bullion.

After washing, the slimes are partially dried on a blanket filter and removed to a hearth furnace (hearth 6x4½ feet), and subjected to calcination for four hours at a dull red heat. When cooled, the product is transferred as required, mixed with a suitable flux, and smelted in graphite crucibles, in two wind furnaces (20x20x28 inches). The flux found to be most suitable is composed of borax, 4½ parts; soda, 2½ parts; carb. potash, ½ part; silica, 2½ parts. The flux is mixed with calcined precipitates in the proportion of one to two.

No niter is used in the preliminary melt, as it is preferable to combine the base metals with sulphur, rather than attempt to remove them as oxides. The corrosion of the crucibles is also slighter than when niter is used. When the charge is thoroughly quiet and fluid, the slag is skimmed off repeatedly with a drop forged iron ladle, fitted with a handle bent almost at right angles, to save the attendant from the heat of the fire. The crucible, when sufficiently filled with molten metal, is removed, and contents poured into moulds. The casts are quickly emptied and thrown into a tub of water, to facilitate the removal of the matte. The latter, in addition to some bullion value, contains some 60% of copper and a small per cent of zinc. The bars from the first melt are freed from matte with a few blows of the hammer, and are re-melted in No. 20 crucibles, refined with a little niter and boneash, and carefully cast into bars of 500 ounces weight, pickled in dilute acid, cleaned, and packed ready for shipment. The first pouring is conducted at a high temperature, to insure the ready and clean removal of the matte on chilling. The final melt is, however, poured at a much lower temperature, and the finished bars are very tough and quite malleable. The slag and matte are bagged, and shipped to the smelter.

In a recent clean-up, in which over 5000 ounces of bullion was obtained, 800 ounces of matte was formed in melting, containing .345% of the total value, and 7200 ounces of slag in which .62% of the total value was locked up for a time. The average value retained by the matte and slag may be safely estimated at a trifle under 1% of the value contained in the precipitate.

The matte carries a greater silver value (usually two to one) than gold, while in the slag, values are about equally divided.

The labor involved in cleaning the extractors, tending acid refining and subsequent drying, calcining and melting, the sulphuric acid used, and the fluxes, crucibles and fuel, cost altogether (on an average of a number of clean-ups) 1 cent for each dollar in bullion produced.

The total working costs per ton are given in the following table:

THE COST OF TREATMENT PER TON.	
Labor.....	\$0.20
Cyanide.....	0.286
Zinc.....	0.0466
Lime.....	0.0140
Elevation of pulp.....	0.0375
Cleaning up, refining and melting, labor, supplies	0.0437
Sundries: Filters and shovels, etc.....	0.0065
Chemical supervision and assays.....	0.0875
Total cost.....	\$0.7218

These costs are for the combination of single and double treatment at present in vogue here; should all the mill be changed to single treatment, as is probable, the future working costs would be reduced 15 to 18 cents per ton, on the same monthly tonnage.

The plant for the treatment of dam slimes is at

work during the four summer months, and has a capacity of sixty to seventy-five tons per day.

Since writing the above, a filter press has been installed to facilitate the cleaning up of the zinc gold slimes. The press is an open delivery, two-eyed pattern, with flush plates and distance frames, forming a cake 1 inch thick. Each press charge of twenty-four cakes weighs, when dry, about 350 pounds. The cakes are 19 inches square, and are formed between a layer of heavy woolen filter cloth, covered with filter paper.

During the clean-up of the precipitation boxes, the liquor in the reduction vat is continually siphoned into a small sump, and elevated by a Poble air lift 5 feet into a monteju, and from thence forced by air pressure through the press, to remove any solid matter. The contents of the press are added to the slimes remaining in the vat, and the mass subjected to treatment with sulphuric acid, with constant mechanical stirring.

When the reduction has been completed, the refined slime and acid liquor is delivered to the monteju, and kept, by the compressed air, at a pressure of sixty pounds for two or three hours. This contact under pressure with dilute sulphuric acid removes much of the copper, leaving a very pure product for subsequent melting. The contents of the monteju are forced into the press, and the liquor, heavy with copper and zinc, removed; the press cakes are washed by water under pressure to remove sulphates, and finally dried in compressed air. When removed to the melting room, for drying and melting, the cakes contain about 17% moisture, and are tolerably free from sulphates.

The filter press, with the monteju, has proved a very valuable aid in the monthly clean-up, rendering the loss of gold practically impossible, and saving considerable time.

The Manufacture of Plaster of Paris.

Written for the MINING AND SCIENTIFIC PRESS.

The gypsum should be crushed with a first-class crusher—jaw crusher preferred—down to about 1-inch cubes. If a jaw crusher is used, the opening should be 20x12.

The crushed rock should then be dried on a rotary, direct-heat dryer. The products of combustion should not pass through the material, unless oil, gas or coke is used for fuel, but should pass on the outside of the dryer. The size of the dryer depends upon the capacity required, and should have in connection with it a good dust chamber for settling the dust, which is valuable.

After drying, the material should again be crushed in an ordinary howl crusher. It is then ground to about 80 mesh, usually on French buhrstones or in some pulverizer, as may be desired.

The ground material is then passed into a calcining kettle, usually about 8 feet diameter and 8 feet high, with cross flues, fire front, graters and doors, and also with upright shaft and stirrers near the bottom, driven with heavy gears above.

The material is slowly fed into the calcining kettle, when it soon begins to boil; more material is gradually added until the kettle is full. From rock that has been crushed and dried thoroughly, a charge can be calcined in about an hour and a half, depending on the dryness of the gypsum, also of the finished product. The material contains enough moisture to thoroughly boil for a short time, when it comes to a dead state, and then will boil the second time, and, in some cases, even the third time. The more times it boils the better the quality of the material. Gypsum contains over 20% water of crystallization. For ordinary plaster work but one boiling is necessary. For fine work and plaster of Paris two boilings are essential. This is where the chemical change takes place. After it is sufficiently calcined or boiled, it should be immediately emptied and placed in hoppers or bins, constructed of brick or iron, after which it is ready to be conveyed and elevated to the storage bins, to be packed in barrels or sacks, ready for the market. As soon as the kettle is emptied another charge should be immediately put in.

To manufacture ten tons of plaster of Paris an hour would require the following machinery:

A breaker for crushing the material to 1-inch cubes; estimated price, \$1000.

Rotary direct-heat dryer, 48 inches diameter, 27 feet long, together with dust room; estimated price, \$2500.

Bowl crusher for crushing the material after drying fine enough to grind on buhrstones; estimated price, \$300.

Four French buhrstones for grinding; estimated price, \$1200.

Two calcining kettles; estimated price, \$1200 each.

Necessary hoppers, bins, conveyors and elevators. For power it will require an engine of about 150 H. P., with the necessary boilers for same.

If it is desired to make this material into wall plaster—which is now largely done—in addition to the above, it will be necessary to have a dryer for drying sand and a hair picker for picking the hair, and the necessary dry mixers for mixing the different materials.

Water Hoisting in the Anthracite Region.*

NUMBER II—CONCLUDED.

Written by R. V. NORRIS, of Ilvesbarre, Pa.

In discharging, either arrangement may be made for taking care of the double discharge, or, where this is undesirable, only one valve may be opened, making the discharge in all respects similar to that at present used.

The time required for emptying bottom-dump

FIG. 5.

tanks averages about eight seconds, while the actual stop for end dumps is but about two seconds, though some of this advantage is lost by the necessarily slower landing of the latter.

While all the regular water hoists are in shafts,

FIG 6.

very large quantities of water have been hoisted from slopes in emergencies. The tanks are usually of the end-dump type, though not used tandem, and have done excellent work. The principal objections to their regular employment are: the rapid wear of the wheels caused by acid mine water working into the bearings and replacing the oil; the slower hoisting speed necessary for tanks running on wheels, as compared with those in shafts sliding on guides; liability to derailment at any point of the hoist; the extreme danger of derailment when entering the water; and the danger, on flat slopes, of obstructions remaining on the rails under water.

There is, however, now being erected at the Hickory Ridge colliery of the Union Coal Company, Shamokin, a permanent water hoist on a 70° slope (Fig. 9), in which it is believed that many of these difficulties have been obviated. The tanks have a capacity of 1400 gallons each, and are mounted on closed, self-oiling wheels with bronze bushings, and close-fitting bronze shields in the end of the hubs, which fit over bronze collars on the axles. The wheels are made

FIG. 7.

with extra high flanges, and the tank is provided with top and side shoes, as shown, which slide in between permanent guides, at the foot of the slope, extending 20 feet above the water line, to avoid danger of derailment when striking the water; the pitch being 70°, there will be no danger of obstructions remaining on the rails under water.

* Trans. Am. Inst. Min. Eng. (condensed.)]

The three water hoists on which costs of operation are available are the Luke Fidler, Lytle and William Penn shafts; of these the William Penn was first started, October 30, 1902, to unwater the colliery after the strike, the plant having been finished during the trouble; the Lytle has been in operation for about two years; but, owing to the uncompleted condition of the colliery, its work has been irregular, except in removing the water which accumulated during the strike; while at the Luke Fidler plant the records are in excellent condition, excepting the steam consumption, which is unavailable.

The Lytle shaft was filled to a depth of 860 feet during the strike and the water, amounting to 274,083,500 gallons (36,727,000 cubic feet), was hoisted out in thirty-seven days and four hours. Besides the regular water hoist, tanks were used in all four coal compartments; the plant then consisting of two pair of 2600-gallon (348 cubic feet) tanks, with a pair of 36x60-inch first-motion engines for each pair; also one pair of 1500-gallon (201 cubic feet) tanks operated by a pair of 30x48-inch Corliss engines; the total water hoisted by each was:

	Water Holsted.		Average Per Day.	
	Gallons.	Cu. Ft.	Gallons.	Cu. Ft.
Water hoist	113,154,600	15,162,716	2,977,753	399,019
Large coal hoist ..	106,519,400	14,273,600	2,803,142	375,621
Small coal hoist ...	54,409,500	7,290,873	1,431,829	191,865
Total.....	274,083,500	36,727,189	7,212,724	966,505

The hoisting during November was regular; 236,906,000 gallons (31,745,300 cubic feet) were hoisted

FIG. 8.

from an average depth of 740.6 feet. During this time the boiler plant (12-150 H. P. return tubular boilers and one 500 H. P. B. & W. boiler) was devoted exclusively to this hoisting, burned 4122 tons of coal, and was supplied with 6,206,100 gallons of metered water,

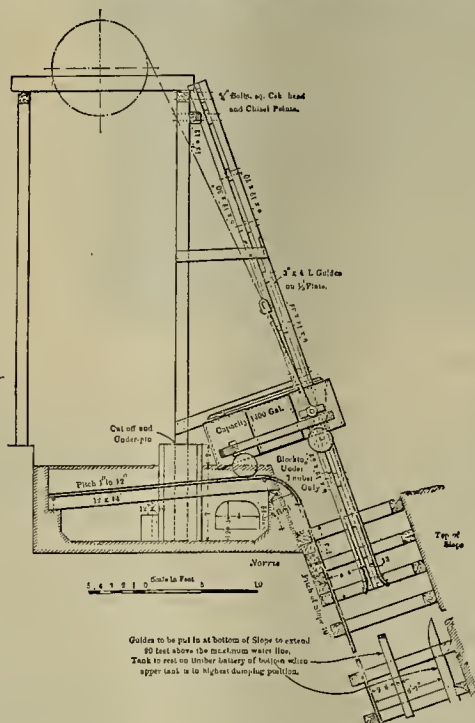

FIG. 9.

which would indicate an average evaporation on 5.55 pounds per pound of coal. Allowing 15% of the water supplied for use in blowers, condensation and waste, it would be equivalent to about 44,004,000 pounds of dry steam at the engines, giving an approximate duty of 33,260,000 foot-pounds per 1000 pounds of dry steam, or 59½ pounds of steam per actual horse-

power hour in water lifted, and 251 pounds of steam per 1000 gallons lifted 1000 feet (1878 pounds of steam per 1000 cubic feet water lifted 1000 feet, or about 30 pounds steam per 1,000,000 foot-pounds in water). This is based on the assumption that the steam used would be proportional to the hoist, which would be, if anything, against the plant.

The cost of steam during this month was as follows:

Labor, repairs and supplies	\$934 62
Water.....	496 49
4122 tons coal, at 50 cents per ton.....	2,061 00
	<u>\$3,492 11</u>

Thus, about 44,004,000 pounds of dry steam delivered at the engines cost \$0.0794 per 1000 pounds (labor, repairs and supplies, \$0.0326; fuel, \$0.0468); equivalent to \$0.0198 per 1000 gallons hoisted 1000 feet vertically (\$0.1485 per 1000 cubic feet); or \$0.00238 per 1,000,000 foot-pounds in water; \$0.00472 per horse-power hour in water; cost of steam, only, per year, per boiler horse power, twenty-four hours per day, including labor, supplies and repairs, \$8.57; fuel, \$12.30; total, \$20.87. The cost for generating steam at the collieries of the Lykens Valley Co., figured on the same basis, allowing 15% waste as above, is \$0.0311 per 1000 pounds dry steam delivered at pumps (\$0.0389 for labor, repairs and supplies, and \$0.0422 for fuel), and averages \$17.04 per year per boiler horse-power twenty-four hours per day.

The cost of the steam supplied has been gone into in detail in this place because this plant is the only one at which a single boiler plant has been devoted to water hoisting for a sufficient time to arrive at a fairly accurate estimate of the cost of power, and the figure here obtained, 2 cents per 1000 gallons (15 cents per 1000 cubic feet), raised 1000 feet vertically, will necessarily be used throughout this paper. The cost of hoisting, exclusive of steam, during this month was \$1676.74, or \$0.0071 per 1000 gallons (\$0.053 per 1000 cubic feet) hoisted, including all supplies, labor and repairs.

The new plant of the William Penn No. 2 shaft, which was flooded to a depth of 250 feet, hoisted 112,468,080 gallons (15,070,730 cubic feet) of water from Oct. 30 to Dec. 5, 1902, inclusive, using the pair of regular water hoist, 32x48-inch engines, and the pair of 28x48-inch coal engines, with 1440-gallon (193 cubic feet) end-dump tanks (Fig. 4), and 1320-gallon (177 cubic feet) emergency bottom-dump tanks (Fig. 7), the record being:

	Water Hoist.	Emergency Hoist.	Total.
Tanks hoisted.....	48,269	32,546	80,815
Hours actually worked.....	805½	593½	1,403½
Tanks per hour.....	59.9	54.4	
Gallons hoisted.....	69,507,360	42,960,720	112,468,080
Cubic feet hoisted.....	9,313,985	5,756,745	15,070,730
Average depth hoisted, ft.....			727.8

The total cost, exclusive of steam, was \$987.83, or \$0.0088 per 1000 gallons actually hoisted (\$0.066 per 1000 cubic feet).

The following is the record of the Luke Fidler shaft water-hoist 32x48-inch engines, with 1450-gallon (188 cubic feet) tanks, for the three years of regular operation—1899, 1900 and 1901:

Height of hoist, feet.....	960
Number of tanks hoisted.....	633,456
Average number per year.....	211,152
Gallons hoisted cu. ft.....	918,501,200—123,079,160
Average per year (gals.), cu. ft.....	306,167,067= 41,026,386

		Per 1000 gals.	Per 1000 cu. ft.
Cost of labor.....	\$6,372.00	\$0.00695	\$0.05212
Supplies and repairs, in- cluding two new ropes, sheave and tank.....	4,087.20	0.00445	0.03337

Total, exclusive of steam.	\$10,459.20	\$0.0114	\$0.0000
Steam on basis of Lytle figures }	17,635.22	0.0102	0.1440

Total cost.....	\$28 094.42	\$0.0306	\$0.2295
-----------------	-------------	----------	----------

This plant was, however, operated at only about one-third of its capacity. At full capacity its cost is estimated to average about $2\frac{1}{2}$ cents per 1000 gallons for 360 feet vertical.

The summary of the operating cost of the three plants just referred to is as follows:

PLANT.	Fidler	Wm. Penn	Lytle
TIME.	3 Years.	37 Days.	1 Month.
Depth of shaft, ft.....	960	953	1,500
Quantity hoisted, gals.	918,501,200	112,468,080	236,906,000
Quantity hoisted, cu. ft.	123,079,160	15,070,730	36,727,189
Av. height hoisted, ft..	960	727.8	740.6
Cost labor, repairs, supplies per 1000 gals....	\$0.0114	\$0.0088	\$0.0071
Cost steam per 1000 gals	0.0192	0.0146	0.0148
Total cost 1000 gals..	\$0.0306	\$0.0234	\$0.0219
Total cost 1000 cu. ft..	0.2295	0.1755	0.1643

This is much less than (about 69% of) the average cost of pumping at the collieries of the Lykens Val-

ley Coal Co., where it was \$0.37 and \$0.29 per 1000 cubic feet 1000 feet vertical, and \$98.11 and \$81.47 per horse power year in water for the years 1901 and 1902, respectively, and which it was estimated could be reduced to about 25 cents and 19 cents in the respective years by the use of a modern compound condensing pumping plant. In this comparison it should also be considered, however, that the steam cost of hoisting could, if desirable, be proportionately reduced by the use of compound engines, condensing or non-condensing, or even by running the present simple engines as condensing.

Aside from the question of cost, however, there are many very great advantages in hoisting water, particularly from deep shafts: In the simplicity of construction; having all the operating machinery on the surface, with the resulting low cost of repairs, which are practically confined to tanks and ropes; the almost total absence of slip, which under mining conditions reduces materially, from the quantity calculated from "plunger displacement," the actual quantity of water pumped; the avoidance of underground steam lines, with their large condensation losses, damage to roof and timbering from the heat and exhaust steam, and the danger of fire incident to their use; the almost total freedom from danger of falls or squeezes in the mines; and, most of all, because the operating plant cannot be flooded.

These advantages were brought home most forcibly to the anthracite operators last year, when, after a six months' strike, the water hoist collieries were promptly unwatered, while in our case, at least those where the pumps had been drowned, they are still flooded in the lower levels. The history of the Lytle colliery, a notoriously wet one, also furnishes a case in point. Until the accession of the present management the regular report was, "We are holding the water," and it required seven months of unremitting effort, moving pumps down the slopes, and a tremendous expenditure of money, to clear the colliery of a volume of water barely equal to that removed by the hoisting plant this fall in thirty-seven days, at an expenditure, excluding the value of the coal burned, of \$5918.63.

It is also to be noted that, on account of the strain of this constant work on the hoisting engineers, it is the custom to have them work in three shifts of eight hours each.

Boiler Room Economy.

The accompanying cut illustrates a form of economy in the boiler room by use of an industrial railway as

Industrial Railway in Boiler Room.

furnished by the C. W. Hunt Co., West New Brighton, Staten Island, N. Y.

In small steam plants little attention, as a rule, is given to the handling of the coal and ashes. Where only one or two boilers are employed a wheelbarrow is considered the cheapest and easiest means of bringing the coal from the storage bins to the furnace door, simply because the wheelbarrow is capable of transporting as much coal as is required and as rapidly as it is wanted, for the boiler consumption. Much time is wasted in keeping the floor clear of the coal which trickles from the barrow on its way to the furnace, and the untidy appearance of the boiler room with the coal dumped in a heap at the furnace door is discouraging to the fireman.

To install an industrial railway, equipped with a charging car, is not a costly item. It is a convenient way of carrying coal to the boiler room, and is the least laborious in firing, as the coal is at the most convenient distance from the furnace and at the right level for ease in shoveling. The coal remains in the car until it is shoveled directly into the furnace, and the floor of the boiler room is kept entirely free from dust and dirt. The center of the car truck should be about 8 feet from the boiler front.

The car is designed for bringing coal from the stor-

age bins to the boiler rooms, and is made of sheet steel stiffened with angle iron, the rivets spaced 2½ inches apart, the corners rounded for the workman's hand, the bottom flush riveted, and specially arranged to have the surface of the door when let down a little higher than the floor of the car, so that the coal shovel will not catch on the edge of the car bottom. The tipping body cars have a dumping gear which keeps the body completely under control in dumping the load, and prevents the violent shocks that occur when the body dumps by gravity alone. The cars have springs, which make them run easily and ride smoothly. The hearings are fitted with reservoirs filled with oil and packed with sponge, thus insuring constant lubrication. They have our patent steel wheels, pressed on the axles, and flexible bearings for running easily around a curve of 12 feet radius. A wheelbarrow with a carrying capacity of 250 pounds would have to make eight trips to handle the amount of coal which a charging car carries at one time, namely, 2000 pounds, and less effort is required to move the car with its ton load than the wheelbarrow with its 250-pound load.

Midsummer Measurements of California Streams.

During the summer of 1898, which was one of very great drought throughout the State of California, measurements of low water were made under direction of J. B. Lippincott in numerous streams upon which ordinarily no observations had been taken. These low-water measurements have been made in August, September and October of each succeeding year, including 1902.

Aside from the values of these measurements to irrigators, they have proved to be of much interest and value to those making or contemplating water power development for the generation and distribution of electric energy, because of the fact that the minimum flow of the stream is the controlling factor that determines the size of the plant in all cases where storage of the flood waters is impracticable.

During the summer of 1902 more extensive measurements were made than in any previous year. A hydrographer was placed on the trunk stream near the mouth of the canyon. He was instructed to set up and maintain an automatic steam register; to make a number of measurements at the point selected for the register, and to travel up and down the trunk stream during the period that the register was maintained and make careful meter measurements to determine the relative loss and gain in the main river between points of observation. At the same

time another hydrographer traveled through the upper portion of the drainage basin measuring the principal tributaries at available road and trail crossings. A programme was arranged between these two men so that as far as possible the stream and its principal tributaries were measured both below and above on the same day.

These synchronous measurements were made on the Sacramento, Feather, Yuba, Mokelumne, American, Stanislaus, Tuolumne, Merced, San Joaquin, Kings, Kaweah, Tule and Kern rivers.

Single measurements were also made of numerous other streams in California. A blue-print copy of the tabulation of these results can be obtained prior to their publication in the Annual Report of Stream Measurements by applying to J. B. Lippincott, Resident Hydrographer, 408 Byrne Bldg., Los Angeles, Cal.

THERE are at present in California thirty-six oil refineries, with a total still capacity of 39,871 barrels. Of these seven are at tide water tributary to San Francisco bay, twelve in the San Joaquin valley, five at points along the coast, eleven in Los Angeles and one at Chino, San Bernardino county. In addition there are six others under construction.

Accidents Due to Combustion Within Air Compressors.*

[By ALBERT R. LEDOUX, New York City.]

With the improvements in design and efficiency of machinery the element of danger in its use is becoming less, but it is a question whether the strain involved in operating modern plants is not increasing somewhat the danger of accident due to human fallibility.

I propose to describe a somewhat uncommon casualty resulting from a not infrequent incident in the use of air compressors, and partly due to lack of judgment of the engineer and lack of care in operation. It is not necessary to state the location of the mine in which the accident occurred nor the makers of the compressor, and the object of this brief paper is more to draw out suggestions from members more familiar than I am with the practical handling of mining machinery than to point a moral.

The compressor in question was a three-drill machine of standard make. At the time of the accident it was furnishing air to a single drill working in an upraise from a well-ventilated tunnel, and giving ventilation to a winze below the tunnel, where two men were hand drilling. The compressor also furnished power to a small hoist in the winze, but the hoist was only operated occasionally, and never while the drills were working. The drills were located about 1200 feet from the compressor. The engineer testified that he never had been short of air, and that there had been no complaints that the machine was inefficient. The engineer testified, further, that the water used in cooling the air cylinder had never become greatly heated, but that he used a mixture of good cylinder oil and of a lighter grade known as "Atlantic Red." The valve of the compressor was set to blow off at eighty pounds. He was eating his luncheon in the boiler room when he heard a "crack like a pistol," and, going into the engine room, found water spurting out of the jacket about 2 feet from the end of the compressor. He tightened the jacket and stopped the leak, and found that the jacket was perfectly cool. He next noticed that "grease began to fry on the pipe and receiver."

He next saw that the air pipe had become red hot, the heat extending to a point where the pipe went through a wooden partition, setting fire to it. Then he noticed that the pressure was going down "just as quick as if some one had opened a valve outside," which, in fact, is what happened. He stopped the engine, but, getting the signal for more air, started up again. It is well to note at this point that the intake of the compressor was in the engine room, the temperature of which usually stood at 115° F.

Let us now see what occurred in the mine. What happened at the bottom of the winze cannot be better told than in the testimony of one of the miners at the coroner's inquest: "I was turning a hole and my partner was striking the drill. He says, 'We ain't got much air here this morning; I will ring for some more air.' He rang, started to strike again, and struck two or three blows, straightened up and took a couple of breaths of air, and started in to strike again, and then quit. I had been joshing him, and says, 'You ain't as tough as you used to be.' I stood up, picked up a pick, struck two or three blows, and felt that the air was had. Just then the air stopped, and the hoister tender hollered to us that there was no air and we had better come up. I looked around and seen my partner standing in the corner. He was all trembling, and I caught him as he fell over."

These two men were gotten up by heroic work on the part of comrades and their lives were saved. But not so fortunate were the men in the upraise. There were four of them here, and when they felt the air getting bad they opened the valve full—of course, only increasing the difficulty. They were experienced miners, and at first could not understand what was the matter with them, because their candles continued to burn as usual. This was due, undoubtedly, to the fact that they were working in an upraise, and that the heavy carbonic acid gas sank, and perhaps to the fact that carbonic oxide may have been generated through incomplete combustion or the reduction of the carbonic acid, first formed, by the glowing carbon in the pipe.

Two men were killed and four others barely escaped with their lives as a result of the combustion of the oil, deposited carbon and organic dust accumulated in the compressor, receiver and pipe. Explosions of air compressors due to this cause have been frequent, and lives have been lost thereby, and what is known as the "flaming" of compressors or cylinders is an every-day experience, and in some cases the rupture of the air pipes, but, so far as I can ascertain, without the serious consequences described in the present case.

I shall leave to those better qualified than I the discussion of the best means of preventing such catastrophes. Among those which suggest themselves are the taking in of the air from a point where its temperature is as low as possible, the introduction of auxiliary coolers, the use of as heavy oil as

*Trans. Am. Inst. Min. Eng.

possible—yet never in excess—the cleaning out of cylinders, receivers and pipes, and especially a warning to the engineer to be very sure, when he receives a signal for more air, that the actual shutting down of the compressor may not be more essential. In this case, had he shut down it is probable that no lives would have been lost, for with the stopping of the air the miners would have at once returned to the tunnel level.

Mining and Metallurgical Patents.

PATENTS ISSUED APRIL 21, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE SEPARATOR.—No. 725,609; J. W. Wolfe, Randolph, Iowa.

Combination with tank adapted to contain liquid, submerged hopper therein, vibrating collecting pan in tank under hopper, covered by convex separating sieve close to lower edge of hopper, forming a narrow escape opening.

APPARATUS FOR THE TREATMENT OF GOLD OR OTHER ORES.—No. 725,864; W. B. McPherson, Los Angeles, Cal.

Precipitating apparatus for depositing gold and silver from solution of cyanide of potassium and from other solutions consisting of precipitating box for holding solution, provided with valves and series of electric conducting plates, connected with source of electric supply, gauge receptacle having float adapted to reciprocate therein, means for connecting reciprocating box and gauge receptacle, yoke secured to float, valve rod, devices for connecting yoke and valve, rod and valves adapted to be operated by rise and fall of float within receptacle.

ELECTROLYTIC SEPARATION OF COPPER AND NICKEL FROM MATTES OR ORES.—No. 725,998; E. A. Sjostedt and J. H. James, Sault Ste. Marie, Canada.

Electrolytic process separating copper and nickel from mattes and ores, consisting in concentrating, crushing and desulphurizing matte or ore, dissolving out metals by dilute sulphuric acid heated to boiling, diluting cool liquor to redissolve salts which have crystallized in cooling, thus bringing it to point at which just hold salts in solution, electrolyzing solution with current of normal density about 0.3 ampere per 100 square centimeters cathode surface while being agitated with current of air until most of copper has been deposited and deposit begins to darken, running off solution to treat fresh matte or ore, re-

peating electrolysis and solution as before often as profitable, finally depositing as much as possible of copper in adherent form by reducing current whenever copper deposit begins appear dark, nearly neutralizing remaining solution with caustic soda making it ammoniacal, oxidizing iron by blast air, filtering precipitated ferric hydrate and electrolyzing liquor to deposit the nickel (using nickel cathodes and graphitized carbon or other insoluble anodes) with current normal density from 0.6 to 0.9 ampere per 100 square centimeters cathode surface while heated 80° or 90° Centigrade, and agitated by current air.

CEMENT KILN.—No. 725,975; W. W. Maclay, Glens Falls, N. Y.

Continuous burning Portland cement kiln, comprising shaft-like structure having openings at bottom and provided with combustion chamber, throat above combustion chamber, and preheating chamber above throat, in combination with regular suction device connected with preheating chamber, and with valve or damper located between preheating chamber and top of kiln so that draft exerted through combustion chamber by suction device be regulated by adjusting damper.

MINING COLUMN BAR.—No. 726,066; A. Johnson, Butte, Mont.

Combination of hollow base having securing exterior ribs, horizontal shaft mounted in base, means on outer end shaft for turning shaft, vertical disposed bevel pinion on inner end of shaft, horizontal bevel gear meshing with pinion, vertical screw mounted in base and connected to gear wheel, collar having lugs and column resting on collar and having recesses to receive lugs, screw engaging collar and column, and cap on column having exterior securing ribs.

TREATMENT OF MATTES AND RAW METALS.—No. 725,297; H. G. C. Thofehrn, Paris, France.

Treatment of copper of copper mattes, raw copper, nickel mattes, tin or lead mattes, cast iron, with view of obtaining metallic copper, nickel, tin, lead, steel or puddling iron, consisting in blowing in hearth furnace onto surface of metallic bath formed of mattes or raw metals and by means of blast pipes distributed around furnace, mixture composed of oxidizing agent formed of steam and air, solid oxidizing agent formed by oxides of metals to be treated previously brought to state of grains, metallurgical flux previously reduced to grains and hydrocarbons.

CONVEYOR.—No. 726,098; J. B. Pitchford, Randfontein, Transvaal, South Africa.

Conveyor comprising inclined endless belt, sump at lower end thereof, suction pump arranged over sump, suction pipe leading into sump, and discharge pipe leading from pump to point over lower portion of belt, pipe having flattened end and pump operating discharge material onto belt.

WELL-DRILLING MACHINE.—No. 726,174; J. R. Lewis, Weatherford, Tex.

Combination crank shaft, drill beam operated thereby, master wheel loose on crank shaft, clutch on latter connect master wheel thereto, sprocket wheel on crank shaft, clutch to lock sprocket wheel to master wheel and disconnect therefrom, counter shaft having gear engaging master wheel and having friction wheel, mud-bucket drum in shiftable bearings and having friction wheel to engage and disengage that of counter shaft, drill-rope drum, sprocket wheel carried thereby, endless sprocket chain connecting sprocket wheels of drill-rope drum and crank shaft, and motor geared to master wheel.

SMELTING FURNACE.—No. 725,661; E. F. Blessing, Philadelphia, Pa.

A heating chamber, firebox therein, main muffle within chamber contacting with firebox, and continuous flue surrounding muffle and leading from firebox, supplemental muffle within chamber and beneath main muffle, flue surrounding supplemental muffle, and opening in bottom of main muffle communicating with supplemental muffle through top of latter, floor in main muffle inclined toward opening, tap opening in supplemental muffle at opposite end thereof from communicating opening of two muffles, floor in supplemental muffle inclined toward tap opening, and

extension on top of supplemental muffle forming partition between flue surrounding main muffle and exit of flue surrounding supplemental muffle.

DEVICE FOR EXTRACTING DRILLS, ETC. — No. 725,844; C. A. Horan, Stockton, Cal.

Grapping device consisting of stock, cage applied to lower end of stock and comprising thin sheet metal band of uniform diameter provided with two pairs of diametrically opposed arms integral with upper edge and extending upwardly therefrom and connected at upper ends to stock, bearing pieces upon inner faces of one pair of arms, pair of clutch plates having journals pivotally mounting them upon bearings and notched in edges to clear arms, whereby plates are adapted to seat on upper edge of sheet metal band, plates provided with segmentally recessed beveled biting edges at free ends, edges conjunctively forming elliptical opening, and horizontal grapping hook carried by cage.

PROCESS OF OBTAINING ALUMINA.—No. 725,683; C. A. Doremus, New York, N. Y.

Process of obtaining alumina by reacting upon aluminous material with acid containing fluorine, producing aluminum fluoride, and subjecting fluoride to action of superheated steam.

Gold Milling Practice in Bendigo.*

NUMBER II.—CONCLUDED.

Written by H. C. BOYDELL.

CONCENTRATING APPLIANCES.—These, until eighteen months ago, consisted entirely of blanket strakes and tables. The former are of the usual pattern and require no further description. The Halley table is a percussion table with an end shake. One is provided to each five head of stamps, and the cost of the machine erected is \$300. The pulp is in many cases badly fed onto these tables. Instead of being evenly distributed over the whole breadth of the table, it is delivered in a few irregular streams; surface currents are thereby set up and the efficiency of the machine is considerably reduced.

The Halley table is not suited for the production of clean concentrates. The treatment of the concentrates locally, however, renders this point of much less importance than it would be in the case of a mine situated at some distance from a metallurgical works. Four companies have recently erected modern tables of American manufacture.

DISPOSAL OF CONCENTRATES.—Two methods are in vogue. One is to sell the concentrates according to their assay value, the other is to have them treated at the local pyrites or chlorination works at a fixed charge of \$10 per ton, including cartage to the works. The gold recovered is returned to the company. Edwards' metallurgical works practice chlorination in small wooden vats, using gaseous chlorine, the necessary roasting being done in two Edwards' furnaces. The various pyrites companies grind and amalgamate after roasting, the latter operation being carried out in the old type of reverberatory furnace with steeply inclined hearth. The pans used have flat bottoms. The drags in many cases are of granite. In conjunction with the grinding pans, where the amalgamation also takes place, settlers are used, there being one settler to two pans. So far as I have been able to ascertain, there is no amalgamating pan in use on the field.

At Liddell's pyrites works the pulp from the settlers, which is very slimy, was formerly treated by A. Duncan by cyanide in his slime plant. At the present time the cyanide treatment is being carried

on by Mr. Liddell. As previously mentioned, the concentrates produced at all the mills are far from being clean. On an average they contain 50% of silica, and in many cases this rises to 70% and even 80%.

A number of samples of concentrates submitted to me for assay gave 2 oz. 1 dwt. 12 grs. as the mean value. However, as it is only rarely that the concentrates are assayed, it is difficult to arrive at the actual average; but the above figures may be taken as a close approximation. A considerable proportion of both coarse and slimed concentrates goes into the tailings with the present method of concentration. On examining a sample of tailings from one of the Bendigo batteries and assaying the portions retained on the different sieves, I found the results to be rather high (See Table B), and, suspecting that this might be due to the concentrates, which were clearly distinguishable in the tailings, I decided to go further into the matter.

Another sample of the same lot of tailings was washed, in order to get rid of the slimes—the latter in this case amounted to 40.73% of the amount taken. The coarser portion was then panned off to remove concentrates—the latter amounting to 1.03%. The pulp had been passed over Halley tables, and this large amount in the tailings clearly shows the inability of that machine to effect anything like a complete saving of the concentrates contained in the ore. The coarse portion thus freed from concentrates was then sieved through a series of sieves of decreasing mesh, and the portions retained in each sieve assayed with the following results:

TABLE A.

(1) Portion retained on 30 sieve	= 9.30% assay	15.68 grs.
(2) " " 40 "	= 7.51% "	7.36 "
(3) " " 60 "	= 15.45% "	19.60 "
(4) " " 80 "	= 10.93% "	19.60 "
(5) " " 100 "	= 8.03% "	15.68 "
(6) " passed 100 "	= 6.95% "	23.52 "
(7) Concentrates panned off	= 1.03% "	
(8) Slimes washed off	= 40.73% "	
99.93%		

The higher value of the various portions in the case where sieving only was adopted I attribute to the adherence of fine particles of concentrates to the larger particles. These fine particles of concentrates in the case where washing was adopted passed off with the slimes.

Time did not permit of an examination of the slimes obtained on washing; but I intend to further examine these with finer sieves and definitely locate the portion carrying the highest value.

DISPOSAL OF TAILINGS.—These, in most cases, have to be raised to some height to take them clear of the battery. The means adopted for doing this is pumping. The pump used is of the Cornish plunger type. In some cases the Tee bob is utilized for giving motion to the battery feed pump as well as the tailings pump. It is not unusual for the tailings, after being lifted, to pass over the canvas tables of some enterprising Chinamen before being finally discharged. The usual arrangement is for the Chinamen to pay a fixed sum per week for the privilege of treating the tailings of a particular company.

Owing to the lack of control by assay, it is difficult to state exactly the average value of the tailings. A. Duncan, who sampled many tailings heaps in Bendigo during the cyanide boom of some years ago, informed me that he found the average to be about 1 dwt. 6 grs. This, I think, may be taken as a close approximation, and in support of these figures it may be stated that in no case has it been found profitable to treat the many large tailings heaps existing on the field. The only cyanide work at present carried on in Bendigo is at Liddell's pyrites works and at Duncan's plant at Epsom. Experiments are being carried out on a small scale with the tailings from one of the Fosterville batteries.

CONSUMPTION OF WATER.—This averages 800 to 1000 gallons per ton of ore crushed. The water is usually kept circulating, special arrangements being made for the settling of the sand and slime before returning to the battery. The price of water taken from the open sluice is 12½ cents per 1000 gallons. The battery water usually contains considerable quantities of magnesium sulphate in solution. Many batteries on the field are dependent on the Government supply, the small rainfall and catchment areas available preventing any large quantity being stored.

SCREENS USED.—These are invariably punched, the use of wire-woven screens not having resulted in any increase in output in the few cases where they have been used. The punched screens are made locally by two firms. The average is from 12 to 16 holes to the linear inch, this giving 144 to 256 holes to the square inch. This corresponds with wire-woven screens of a mesh of from 16 to 32. The discharge area in the case of the punched screens is from 35 inches to 45 inches per square foot of screen surface and in the case of wire-woven screens from 65 inches to 70 inches per square foot of screen surface.

Curiosity with regard to the suitability of these sizes of screens to the ore prompted me to examine samples of tailings that had been crushed to pass a 175 punched screen (13 holes to the linear inch). This corresponding to a 25 mesh wire-woven one, yielded on sieving:—

TABLE B.

			Assay Value, dwt. gr.
(1) Portion retained on	30	mesh sieve =	6.72% 2 22.5
(2) " " "	40	" =	8.43% 2 68
(3) " " "	60	" =	16.54% 2 23
(4) " " "	80	" =	11.10% 1 23
(5) " " "	100	" =	15.24% 1 23
(6) " passed	100	" =	41.30% 1 17.8

Value of sample in bulk before sieving, 1 dwt. 28 gr.

Calling the portion that passed the 100 mesh sieve "slime," the tailings contained 41.30% of slime. By washing, another sample of the same lot of tailings gave 40.73% of slimes (Table A), the two results closely agreeing.

A 30 mesh wire-woven sieve corresponding with a punched screen having 200 holes to the square inch or 14 holes to the linear inch, and a 40 sieve to a punched screen having 300 holes to the square or 17 to the linear inch (the correspondence being in area of the holes), it can be seen from an examination of the figures that, although this ore was crushed to pass a punched screen with 13 holes to the linear inch, 93.27% of the pulp produced would pass through a screen with 14 holes to the linear inch and 84.84% through a screen with 17 holes to the linear inch.

The above data appear to me to afford abundant ground for adopting coarser crushing with an ore such as this. The sample experimented on was taken systematically at regular intervals for a period of one week. The presence of so much slime is accounted for by the fact that the stone crushed contained a good deal of slate, a material that passes through all Bendigo batteries in considerable quantity.

MOTIVE POWER.—This is in all cases steam, which is generated in boilers of many types. The one most used formerly was the Cornish; at the present day this has been replaced by the Cornish multitubular, internally fired. Some Lancashire and a few Babcock and Wilcox boilers are in use.

The fuel universally used is wood, the variety most favored being box. The wood is brought from many points within a radius of 30 miles of Bendigo. Some is carted and some delivered by rail. The use of the railway for this purpose has brought about a considerable reduction in the price. The average at the present time is \$1.60 per ton of 50 cubic feet. The calorific power of the wood used is generally accepted as being one-third that of good coal, though I cannot find any data regarding the estimation on which this is based. The estimation of the calorific power of the different woods used as fuel seems to offer a good deal of scope for original work.

COST OF CRUSHING.—This varies greatly, and it is a matter of impossibility, owing to the loose method of measuring the weight of ore and the absence of exact data, to arrive at figures that possess any great degree of accuracy. The conditions under which crushing is carried on at many batteries render the cost high, while in those batteries in which heavier stamps and labor-saving appliances have been adopted the cost is remarkably low.

Mr. Samuels informs me that at the New Chum mine, of which he is general manager, the cost of crushing is less than 50 cents per ton. The consumption of wood at this battery is one ton per 10.6 tons of stone crushed. This is equivalent to a cost of 7.3d per ton. The charge for public crushing is usually \$1.25 per ton, including labor. In no case can I find data regarding the different items of cost, such as labor, office expenses, mercury, shoes and dies, etc. In respect to tabulation and keeping of costs, there is much room for improvement on the field.

Generally speaking, it may be said that the cost is from below 50 cents to \$1.25 per ton. As the tendency seems to be to adopt labor-saving appliances, it is probable that the maximum figure will be considerably reduced.

At Fosterville cheap crushing has, and is still, being done. The low cost is accounted for by the ore, which is a gossan, being extremely friable and easily crushed, and it would be unfair to compare the cost of crushing this with that of the much harder stone occurring in Bendigo.

In conclusion it may be said that, although in many respects, more especially those of control and adoption of labor-saving machinery, Bendigo milling practice might be improved, still, in those sweeping condemnations of that practice, that have been made from time to time, sufficient allowance has not been made for existing conditions. The absence of large and continuous bodies of low-grade ore, such as exist in South Africa, does not admit of large batteries of heavy stamps being erected, sufficient stone not being available to keep such batteries working continuously.

Crushing costs have been reduced in many instances to a remarkably low point, solely by empirical means certainly, but still reduced to such a point as to challenge comparison with the best figures of other and larger fields.

It is quite likely that a mining man might come to Bendigo and see nothing in our milling practice that he would care to adopt in his work elsewhere; but at the same time it is extremely doubtful whether those who criticise our practice most freely would, if transferred to Bendigo, and working under existing conditions, do any better or even do so well as the local men in charge of the milling operations.

*Trans. Aus. Inst. Min. Engs. (condensed).

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The Nevada group of mines, near Juneau, will be opened up this season on a larger scale. These mines are 2 miles below the Ready Bullion and 1 mile from Gastineaux channel. The company will put in a 10 stamp mill, a 12-drill compressor and run two tunnels, one 1000 feet, the other 1500 feet. It is intended to have them in full operation by July 15th, says the Record-Miner.

Manager S. Silverman of the Brown-Alaska Co., operating on Prince of Wales Island, says they are considering the erection of a 400-ton smelter this summer. The company owns the Mamie group of twenty claims and has done considerable development work. A ledge of copper-iron ore has been opened up.

Tacoma advises say the present indications are that by August at least twenty well-boring plants will be in operation in the Kayak and Coal Oil Bay districts of southern Alaska. Steamers sailing for Copper river are taking machinery and supplies for oil companies which have already secured locations. There are five plants on the ground either in operation or being set up. The oil fields are so far from the base of supplies that extra pipe and apparatus are taken. The oil districts are near ample supplies of merchantable timber. W. E. Thomas and H. R. Bradley of the Alaska M. & D. Co. are shipping north a heavy oil-boring plant for development of their 12,000 acres of oil lands, and M. A. Casey is shipping an equipment for use at Coal Oil bay.

ARIZONA.

COCHISE COUNTY.

The World's Fair mine, 1½ mile from Bisbee, has been bonded for \$200,000 to Michigan men, says the Era.

An option on a fifteen-claim group in Dixie canyon, in the Mule mountains, 4 miles north of Bisbee, for \$100,000, has been given to E. Dube, of the Lake Portage Co., operating in Gold Gulch district.

GILA COUNTY.

H. Paschal, of Chicago, Ill., a director of the Tri-Bullion S. & D. Co., owning the Starlight group of claims, near San Carlos, says it is intended to build an aerial tramway, 2000 feet in length, from the mine to Kelly's gulch, from which point there is a wagon road to San Carlos, 7½ miles. The vein opened up in the mine shows returns of 30% lead, 8 ounces silver, \$5 gold and 5% copper.

GRAHAM COUNTY.

A gasoline engine and hoisting equipment are being set up at the Sappbire mine by the Coronado M. Co., near Solomonville. They will sink a 500-foot shaft.

Two cars of copper were shipped East April 23d by the Shannon Copper Co., at Clifton, being 130,000 pounds. The concentrator is handling 300 tons of ore and the company is mining 450 tons daily. The smelter is making eighteen tons of fine copper daily.

MARICOPA COUNTY.

(Special Correspondence).—Messrs. Burson and Langley, who own claims in the White Tank mountains, have bought a 10-stamp mill, which is now being erected near the Buckeye canal, about 5 miles from their property. The ore is free-milling and averages \$20 a ton.

A large deposit of blisnuth ore is reported discovered in the eastern end of the county. The ledge is from 3 to 10 feet wide and carries from 3% to 30% blisnuth.

J. E. Maddox of Phoenix has discovered a deposit of ore in the White Tank mountains which assays \$50 gold.

Phoenix, April 28.

MOHAVE COUNTY.

Manager H. L. Pickett says the Savanic copper mines, south of the Utah line, near St. George, Utah, will be reopened this month. He has been looking into the matter of constructing a road that will connect with the San Pedro, Los Angeles & Salt Lake Railroad, which will cut the wagon haul down to 65 miles. It is 125 miles to St. George.

SANTA CRUZ COUNTY.

The Lucky Lulley Prospecting & Development Syndicate has been incorporated at Tucson (Pima county) to operate a group of mines in Tyndall district, Santa Rita mountains.—B. M. Jacobs, W. H. Barnes, F. S. Nave, A. C. Bernard, L. G. Davis, O. T. Rouse, L. H. Manning, E. J. Trippel, T. D. Satterwhite, H. Buchman, J. Knox Corbett, C. Blenman, F.

Swinnery and M. Lully of Tucson, E. J. Baker and A. T. Birl of Nogales.

The Oro Fino D. Co., that has taken over the Gold Rock Con. group at Oro Blanco, are refitting the mill building and will put in a cyanide plant.

YAVAPAI COUNTY.

(Special Correspondence).—S. E. Bretherton, superintendent Val Verde smelter, intends starting up their large furnace in a few days.

The American Copper Co. will have their 12-stamp mill ready next week. They are running three shifts in the mine. The pipe line for supplying the mill with water is nearly completed. The water will be brought from the Agua Frio river, a distance of 1½ mile. B. Blanchard is manager.

Val Verde, April 24.

(Special Correspondence).—W. A. Kent, manager of the Oriental M. Co., is running his mill one shift per day. He has been unable to get ore enough from the mine to keep the mill busy. In a few weeks he will have the 225 and 300 levels opened up, when he expects to have plenty of ore for the mill. The mine is known in the Big Bug district as the Postmaster.

Providence, April 24.

(Special Correspondence).—P. A. Johns, manager of the Braganza G. M. Co., has the tramway from the tunnel to the mill completed and is now operating twenty stamps in the mill.

Big Bug, April 24.

(Special Correspondence).—The mill of the Poland M. Co. is closed down to permit of some changes being made.

The Express mine has laid off all their men and are letting contracts for work. J. Watterson is in charge at present.

Poind, April 24.

(Special Correspondence).—The Victor M. Co. are overhauling their mill and installing new machinery. They expect to be in operation in thirty days. The mill when completed will have a capacity of eighty tons. The shaft on this property is down to the fourth level and the mine is opened to the 300-foot level; also installing hoist and other machinery. V. R. Salinger, manager; James Breslin, superintendent.

A. G. Curtis, owner of the Paystreak group, has shaft down 121 feet and tunnel in 400 feet. Ore averages \$17 per ton.

About ½ mile north of the Mudhole mine, Lynx Creek district, is the Houghton & Prescott Dev. Co., J. P. Edwards, manager, who is operating on the Sunset and Mark Twain claims. The Sunset is supposed to be a continuation of the Mudhole vein and the Mark Twain is believed to be a continuation of the Victor vein. He is sinking on the Sunset and is down to the second level; also has one shaft down 100 feet and is drifting. Has large flow of water and will put in a sinking pump. Has a 6x8 hoist on the property.

Walker, April 25.

(Special Correspondence).—Miners of Yavapai county have under advisement the putting into operation the eight-hour law passed by the recent territorial Legislature. There are many mines in this county which are in the development stage or not as yet profitable, and an attempt to make the eight-hour law operative would be resisted by mine owners and operators.

The United States Supreme Court has decided the long-continued litigation which has for over ten years past tied up the Hillside mine 50 miles west of Prescott, in favor of Lawler & Wells of Prescott.

Prescott, April 28.

Thornton & Kinsley report opening up 8 feet of gold-bearing quartz at a depth of 25 feet on their claim, 2½ miles east of Mayer.

The Peabody mine in Dragoon district, near Pearce, owned and operated by the Federal smelter at El Paso, Tex., is in full operation with seventy-five men at work. The ore carries gold and copper and is hauled to Cochise station on the Southern Pacific.

The Continental Con. M. Co. has bought the properties of the Mizona Mineral Co. and the Golden Copper Realty Co. of Mayer, the Kensington G. M. Co., the Reade C. M. Co. and other properties, including the Copper Cutlas group in Big Bug district, says the Prescott Courier. The Copper Cutlas group is near the line of the P. & E. Railroad and 20 miles from Prescott.

Articles of incorporation of the Old Mesa Gold Co. were filed at Prescott last week; E. Block, M. Goldwater, D. M. F. Weeks, A. A. Johns, M. Salzman, D. E. Daves, B. H. Gray.

The Virginia, Elizabeth and Choctaw quartz claims at Cherry Creek were sold last week to D. Drew for \$800.

The Sayer G. M. Co. has been incorporated at Chicago, Ill., to work the Leviathan group of nine claims near Mar-

tinaz, by D. J. Sayer, E. L. Hearn, P. L. McArdle, M. W. Gleason and H. J. Killilea. Development of the ore bodies will be carried out until the mines are opened up to an extent to justify the erection of a stamp mill. Water for milling purposes will be pumped 9 miles, with a lift of 400 feet, from Genung's Springs, the pumps to be run by electric power generated at the mines. O. L. Geer of Martinez is resident agent.

CALIFORNIA.

BUTTE COUNTY.

The Oroville Register says there are twenty-two dredgers in operation on the Feather river, near Oroville, and two more being built. The new ones are the El Oro and Lava Bed No. 2. There are eight on the west side of the river and fourteen on the east side.

CALAVERAS COUNTY.

(Special Correspondence).—The Melones M. Co. at Melones are driving ahead the main tunnel (1000-foot level), with one machine on each shift, making 5 feet per day. In the mill sixty stamps are dropping. The launders from the table concentrators have been rearranged so that the "middlings," instead of returning to the head of the tables, are banded by certain of the Frue vanners. The tube-and-ball mill for the cyanide plant is on the ground and the tanks and vats are all in place. The plant will be run by electricity. Distillate has been substituted for gasoline in the furnaces of the assaying laboratory, reducing the fuel cost one-half.

P. F. Woods has set up a grinding mill on the Adelaide, below the Melones mill, and will crush ore from the South Carolina, power being obtained from a 30-foot overshot water wheel.

Melones, April 27.

The Beatrice mine, near Murphys, is being put in shape for further development work, says R. E. Ober, superintendent.

The Gold Cliff mine and the Crystal mine at Angels are being operated with oil as fuel.

The Cassinelli mine at Central Hill, near San Andreas, has been bonded to T. Flint of San Juan, San Benito county, and work will begin this month.

FRESNO COUNTY.

At Coalinga, the Mercantile Crude Oil Co. has two producing wells and will put down two more on the south line of their property near the Esperanza, when they finish deepening their No. 1. The Commercial Oil Co. are planning to put down two additional wells. The Esperanza Co. will put in two and the Fresno-San Francisco Oil Co. will start No. 4.

KERN COUNTY.

The San Bernardino D. Co. are preparing to bore for oil, 8 miles from Hinkley, near Randsburg.

MARIPOSA COUNTY.

At Whitlock the Austin Group M. & M. Co. report work progressing. The Whitlock Chief tunnel has struck pay ore. The Ragan shaft is in ore. A new shaft has been started on the Golden Gate. The bunk houses, assay and general office buildings are being erected.

NEVADA COUNTY.

Articles of incorporation of the Blue Tent M. Co. were filed last week at Nevada City by C. L. Canfield, A. G. Towne, P. C. Drescher, of San Francisco; W. E. Kleinsorge, Sacramento, and C. J. Graham, Nevada City.

The Union Hill Con. mine, near Grass Valley, will resume this month, says the Tidings. The Union Con. Co. owns a group of five claims and a 10-stamp mill. Water power is used. F. Bradley of San Francisco is president and E. C. Creller, vice-president and superintendent. At present seven tributaries are at work on the surface on the croppings and on the dump. The pumps are not being run, and the shaft on the Union Hill, which is down 400 feet, is nearly filled with water.

It is locally reported the Erie mine, near Graniteville, will resume next week.

Manager Look, of the Sunflower mine, of Sacramento, says operations will resume this summer. The Sunflower is on Squirrel creek, near Grass Valley.

R. D. Plummer, interested in a group of claims at Steep Hollow, near Nevada City, says he has men at work opening up the property.

PLACER COUNTY.

The Bonnie Bee mine, at Dutch Flat, made a satisfactory clean-up last week, and the company will add five more stamps to the mill. L. W. Cummings and J. McIntyre of Alameda are directors.

Robinson & Donnelly are unwatering the Crater mine at Ophir, preparatory to development work.

Superintendent Rosenthal of the Pine

Hill mine, 14 miles north of Auburn, says he is building an assay office. The 10-stamp mill has been in operation since January 1.

PLUMAS COUNTY.

Superintendent F. E. Thomas has men at work digging a ditch and making other preparations to open up a hydraulic mine at the upper end of Elizabethtown, north of Quincy.

SAN DIEGO COUNTY.

The articles of incorporation of transfer of the holdings of the Free Gold M. Co. to the Gold Fields of California, Ltd., an English corporation, were filed last week. The property consists of thirty mines and claims (the Golden Cross group), together with a 40-stamp and a 100-stamp mill, near Hedges. The price was \$2,400,000. The company propose within six months to increase the capacity of the cyanide plant from 300 tons per day to 1000 tons.

W. W. Boswell, superintendent of the Julian Con. M. Co., near Julian, says work has resumed in the Helvetia and High Peak mines.

H. E. W. Wilson, of Los Angeles, and J. Collins, of Banner, report finding oil on one of the seven claims which they located at Fig Tree, 4 miles from Fish Springs and 18 miles southeast of Salton, Riverside county.

SANTA BARBARA COUNTY.

The de la Guerra ranch, of 2200 acres, between Careaga and Lompoc, has been sold to a company composed of Scotch and English men, with Barneson, Goodall, et al., of San Francisco, and McKay, of Santa Barbara, incorporated as the Los Angeles Oil Co. The de la Guerra ranch is surrounded on three sides by the Western Union Oil Co., and on the other by the Union Oil Co.

SANTA CLARA COUNTY.

The Phoenix Quicksilver M. Co., organized at San Francisco by A. Hayward, E. T. Newhall, J. H. Hopkins, C. A. Shurtliff and H. Stevenson, have taken over a number of quicksilver mines and mineral land in Red Mountain mining district, east of Mount Hamilton, near San Jose.

SHASTA COUNTY.

Manager M. Lindley has men at work on the May Blossom mine, near Bully Hill, near Wintrop.

J. Lanyon reports opening up 2 feet of gold quartz in his Hidden Fortune mine in Old Diggings district, near Redding, and one-third mile north of the Texas mine.

Forty men are at work at the Balaklala mine, near Kennet, and this is to be increased as development requires. Since the fire that destroyed the company's office extensive improvements have been under way. An assay office and engineers' office is under construction. The boarding house will be provided with hot and cold baths. The new bunk-house will accommodate a hundred men. In the new ore bins being constructed ore will be stored until a sufficient quantity is on hand, when a smelter will be put in. The ore is low grade, averaging from \$12 to \$18 per ton in copper, gold and silver. A large air compressor will be put in.

The machinists employed at the Iron Mountain Co.'s smelter at Keswick were ordered out on strike by their union last week, but refused to obey the call, as there was no occasion for a strike, which was intended as a retaliatory measure against the company because of the failure of the miners' strike. A large number of both union and non-union men are now at work at the mine and smelter of the Iron Mountain Co.

There are 916 men at work for the Mountain C. Co. On Monday there were 874 men at work. Tuesday morning a car containing forty-two men was switched off at the station and every one of the men entered his name on the company's roll and is now at work. There was no attempt to intimidate the new comers. As in the previous shipments these men are mostly Americans and many of them belong to unions. The machinists who were reported to have walked out on a sympathetic strike are still at work. Things at Keswick are assuming their normal, ante-strike condition.

SISKIYOU COUNTY.

An Eastern company has bought the Yreka M. & M. Co. mines in the Salmon river section, near Rollin, the Black Bear mine in same vicinity, the King Solomon mines, near Cecilville, and also the ditch of the Salmon River Hydraulic Co. at Sawyer's Bar, for supplying the power in working these mines, says the Journal.

Superintendent L. S. Williams, of the Siskiyou M. & D. Co., reports on their coal mine at Herr's ranch, between Yreka and Ager, he has the incline shaft down 825 feet. Three feet of coal are showing in

face of the tunnel. Hauling the coal up the slope was found to be an expensive method of mining, on account of the distance and the amount of water they have to contend with, and the company has decided to go into the valley below and sink a vertical shaft, which will be 200 feet deep, to strike the body of coal with depth.

SISKIYOU COUNTY.

The work of fixing up the No. 1 blue gravel mine at Greenhorn, near Yreka, since secured by J. W. Williams, is being carried on under the management of J. Garvey, and is nearly in readiness for pumping out, says the Yreka Journal. It is difficult to get wood for the engine. As soon as the electric power plants are prepared to furnish power the steam machinery will be discarded.

The Jillson quartz mine, near Hornbrook, is working and the mill running steadily. The ledge, which pinched out a year ago, has been found by prospecting.

TRINITY COUNTY.

It is reported the Brown Bear mine, at Deadwood, will close down on June 1. At present there are only twelve miners at work, and the Joker ledge, which has furnished ore for the mill for some time, is about worked out. No wood is being cut, and Superintendent Dobler declares that the mill will be running on custom rock only after that date.

TUOLUMNE COUNTY.

A \$6000 pocket is reported taken out of the Sugarman mine at Bald mountain last week. It is reported owned by J. H. Neale and leased by Herold, Smith & Watson.

Stanford & Estee have put in a heavier hoist at the Doyle ranch gravel mine on Table mountain, near Sonora. O. Doyle is superintendent.

E. S. Root has a bond for a deed on the Never Sweat claim, near Sonora, for \$2000.

W. A. Swerer of Tuttle town has bought the interest of M. F. Swerer in the Swerer Bros. quartz mine and mill, near Tuttle town.

W. Sharwood has bought a one-third interest in the Georgiana quartz mine, adjoining the New Albany south extension, formerly the Garfield mine, near Carters.

J. S. Raggle has bought the Golden Annie quartz mine on the main Tuolumne river, near the mouth of Big creek, near Big Oak Flat.

The Vine Spring mine has been sold to the Yankee Hill G. M. Co. for \$5000 cash, it having been under bond to that company. The mine is near Columbia.

R. C. Davis has bought of J. F. Newcomer a half interest in the Newcomer mine, being subject to a bond held by D. Copella; also a 2-stamp quartz mill and all machinery, water rights and mill site on Knights creek, near Sonora.

The Goldwin mine, on the North Fork of the Tuolumne river, near Carters, is down 612 feet, and, pending the arrival of heavier machinery, only a few men are at work in the mine on the 300 and 500 levels. There is a 10-stamp mill on the property. The new hoist will be capable of sinking 500 feet deeper.

YUBA COUNTY.

The Fortuna M. Co. has bought 420 acres of placer mining land near Bullard's Bar, there being twenty-one claims in the original locations. Boring, drifting and other development work has been done and will be continued.

COLORADO.

BOULDER COUNTY.

R. G. Mullen, manager of the Montgomery G. M. & R. Co., at Puzzler, and F. R. Jeggery, of Colorado Springs, superintendent, say the cyanide tests on their ores have been satisfactory, and the plant will be built. The Montgomery group consists of several claims near Puzzler, in Ward district.

A body of nickeliferous pyrrhotite at the head of Long gulch is being developed by the Wellington Co., near Wall Street, who are pushing this work. A tunnel is being driven in from the gulch and will cut the ore at depth of 200 feet. A width of 25 feet of ore at a depth of 50 feet is shown in the upper workings.

CLEAR CREEK CO.

At the Little Clara mine, near Yankee, owned and operated by Hawks Bros., at a depth of 55 feet a 2-foot pay shoot has been opened up, assaying \$150. The Gold Anchor is saving four-ounce ore and four carloads are ready for shipment. They are drifting at 115 feet.

Work has been resumed in the Burns-Moore tunnel at Idaho Springs and will be extended to the 2000-foot point, 800 feet having been driven. J. M. Shaller & Co., of Denver, are the owners and operators. The International M. Co., operating the Little Six group in Georgia gulch and the

Bull Moose group at the head of Virginia canyon, have taken a lease and bond on the Remington mine, 1 mile up Virginia canyon from Idaho Springs, in Seaton mountain section. Superintendent O'Neill says he will drive the main tunnel ahead on the vein.

Manager Robeson says the drift on the Phillips lode in the Burleigh tunnel, near Silver Plume, is being advanced both east and west from the tunnel, and 600 feet of ground has been drifted through, showing a streak of ore 12 inches in width with values in lead.

FREMONT COUNTY.

Two more oil companies have been organized to exploit a portion of the Florence oil field—the Castle Rock Oil Co. owning deeded rights to 1500 acres of ground, north of Florence, across the Arkansas river—J. A. Milner, J. A. Patterson, A. W. Lucas, C. W. Lucas and W. M. Helm; and the West Lebanon Oil Co.

The Keystone Oil Co. well No. 5, near Florence, is yielding 150 barrels of oil per day. It has been decided to drill another well. T. M. James is president and manager.

The Empire Zinc Co., south of Canon City, has doubled its capacity. The magnetic dry process is used, and they have put in five additional separators. There are sixty men on the payroll. Most of their ore comes from Leadville. They have 28,000 tons of ore on the ground ready to mill.

GILPIN COUNTY.

The Four-Mile Gulch Tunnel M. Co. is operating the Bryan and Wheeler groups in Dory Hill section of Enterprise district, near Central City, and has opened up ore in both the Bryan and Wheeler tunnels. The Bryan tunnel is in 1010 feet, showing a 3½ foot vein, with 18 inches of silver-lead ore assaying \$63 per ton. The Wheeler tunnel is in 560 feet. Two winzes are being sunk below the tunnel level and both are in ore. The company will also resume operations on the Democrat, erect a shaft building and put in a 16 H. P. gasoline hoisting engine. This shaft is down 100 feet and will be sunk to 500 feet, which will make connections with the Bryan tunnel. J. Brohl is superintendent.

Wilkesbarre, Pa., parties have organized the Wilkesbarre M. & M. Co. and have bought the Blind Girl and Sick Dutchman lodes, a one-half interest in the Dark Horse claim, and taken a lease and bond on the Baldwin and West Baldwin lodes, all near Russell Gulch. The shaft building is completed on the Baldwin shaft, which will be made the main working shaft of the group, and a 12 H. P. gasoline hoist set up. This shaft is down 120 feet and is being cleaned out and re-timbered. There is a tunnel cutting this shaft at a depth of 80 feet, which provides ventilation. J. F. Harrington is superintendent.

W. Mitchell & Sons are sinking on their Gulch claim in Lake district, near Central City, and are down 150 feet. They expect to replace the whim with a hoisting plant.

The Russell Gulch M. & D. Co. are unwatering the Rocky Mountain Terror mine near Russell Gulch. The shaft is 450 feet in depth.

An air compressor has been put in at the Buell mine, of the Gregory-Buell Con. G. M. & M. Co., near Central City, and work started on a contract of 1000 feet of machine drifting and stoping. The mine will be developed so that by the time the mill is completed there will be ample supply of ore. The Gregory mine is making regular shipments to the stamp mill and smelting ore to the sampler. All hoisting is to be carried on through the Buell shaft.

GUNNISON COUNTY.

The Porcupine group of five claims on South Gold hill, near Tin Cup, is sold to Waterbury & Adams of Denver for \$9000. The Porcupine tunnel is in 1100 feet, and at 450 feet from the south entrance a 4-foot vein was cut which averages \$8 in gold and silver; at 150 feet farther a 12-foot vein was struck which runs 5% copper, \$2 in gold and silver. A shaft of 120 feet also shows a vein which carries 4½% copper, seven ounces in silver and \$2 in gold.

In Taylor Park section, near Tin Cup, the Woods G. M. Co. of Kansas City has been incorporated and secured sixteen lode claims on Jenkins mountain. A tunnel is in 200 feet and showing ore 12 feet across, averaging \$15 per ton in gold. It is free milling. The vein has been opened for 1000 feet by shafts and tunnels. The company has bought a 100-ton mill. J. Lynch of Tin Cup is superintendent.

HINSDALE COUNTY.

The Tobasco G. M. & M. Co. of Lake City, which is operating in Burrows park, propose to resume operations at both mine and mill next week, says President J. Martin.

LAKE COUNTY.

The Belgian-Frenchman M. Co. was incorporated last week to operate the Belgian and Frenchman mines, on Iron hill, Leadville. To furnish drainage, an arrangement will be made with the Yak tunnel for driving a lateral into the property. If desired, this lateral can also furnish transportation facilities at about one-half the cost of hoisting to the surface. The directors are A. D. Dickinson, J. L. Wright, L. R. Johnson, J. H. Stotesbury, G. F. Burtch. J. H. Stotesbury is manager.

The principal producing mines at Leadville are the Moyer, 300 tons per day, Ibox 300, Small Hopes 200, Home M. Co. 225, Fryer Hill 250, Caribou 100, Sixth Street 100, Resurrection 150, A. M. W. 150, Midas 150, Yak 150, and a number of others that are producing from thirty to sixty tons a day. The zinc tonnage of the district is 200 tons daily.

The April output of Leadville is expected to show a considerable tonnage of manganese ores, due to the demand from the Pueblo steel works. Most of this ore is coming from the Sixth Street, Catalpa-Crescent, Yankee Doodle and Crofton mines. The demand for oxidized iron continues.

SAN JUAN COUNTY.

Work was resumed last week at the King mine, on Sultan mountain, near Silverton, after a shutdown of several months. The 1000-foot tunnel is being extended to cut the King vein and is now 300 feet ahead, says Manager Pyke. Drifting will begin on the King vein. Twelve men are at work. It is the intention of the company owning the Cleveland mine, on Sultan mountain, 3½ miles down the Animas canyon, to put in a compressor and cut the vein by tunnel. The Cleveland is below the King mines, on the same vein system.

After three months' pumping, the unwatering of the North Star mine on Sultan mountain, near Silverton, was finished and drifting on the vein at the bottom of the 110-foot shaft has begun.

Final payment for the Hazlett interest in the Tom Turner group of claims, and the Florence millsite, above Gladstone, has been made by the Gold Queen M. Co. The directors of the company are G. W. Crawford, W. E. Bridgman, H. Riddle, H. J. Hayham, J. T. Richards and W. P. Mallon.

The Silver Queen mine, in Mastodon gulch, near Silverton, reports making another strike, opening up a streak of lead-copper ore which carries gold values. Superintendent J. James says the strike was made on the midway vein by a crosscut from the main tunnel, which was run 250 feet. This crosscut will give the company 200 feet of stoping ground and 350 feet to the surface workings.

Manager H. S. Born of the Little Maud group at the head of Maggie gulch, near Silverton, says work will be resumed next week. Last season shipments of smelting ore were made. New workings will be started and a crosscut tunnel run to tap the veins at greater depth.

The Monte Vista claim in Maggie gulch, near Silverton, will begin operations next week. C. A. Johnson of Durango has bought a one-third interest in this claim and holds an option on another one-third for \$5000. There is a tunnel in 75 feet which cuts the vein at a depth of 56 feet, showing a body of milling ore 6 feet wide, carrying gold values. Some sylvanite is found in the vein.

TELLER COUNTY.

L. D. McMullen, holding a lease on the Alexander Marsh claim on Raven hill, at Cripple Creek, owned by the Amethyst G. M. Co., has resumed operations. The shaft is down 100 feet and will be deepened to 180 feet before starting lateral work.

F. A. Wright, manager of the Lincoln M. & M. Co. mines on Lincoln hill, near Gillett, with Eastern men has been granted a lease on the Hoosier properties on Tenderfoot hill, Cripple Creek, for thirty months. The main shaft has been sunk to 488 feet and will go 300 feet deeper. There is also an incline shaft of 300 feet. A crosscut will be driven northeast from the 400-foot point in the main shaft.

A compressor is being set up on the New Haven mine on Raven hill, Cripple Creek, by a leasing company composed of Victor men.

The Jupiter P., M. & M., Ten Diamonds and Venue lodes have been sold to a New York company in which are interested P. M. Egert, R. J. Meredith, G. A. Jepsen and S. T. Kane, of Holland Patent, N. Y. The four claims, which are in Lexington district, near Idaho Springs, have a tunnel driven 200 feet.

The appropriations being insufficient to complete the second geological survey of Cripple Creek district by the U. S. Geological Survey, the mine owners and operators of Cripple Creek and Colorado Springs mining men have contributed

liberally to raise funds with which to finish the work.

The Kaffirs G. M. Co. have granted a lease for two years to C. S. Page & Co. on the New Turn and May Brewin claims, near Cripple Creek, on a 20% royalty. The Kaffirs Co. owns fourteen acres on Squaw mountain. The shaft on the New Turn is down 65 feet. The vein which has been uncovered at the surface is known as Squaw Mountain vein No. 4, and farther up the hill has shown values.

Sinking in the main shaft of the Rocky Mountain Leasing Co., operating on the south half of the Delmonico, on Bull hill, at Cripple Creek, has been suspended pending the result of investigations in progress on the Olive shaft, north on the same property, where the Rocky Mountain Co. is driving a crosscut to determine if the shoot found in the main workings extends into depth. On the 150-foot level of the main workings a vein was opened that has yielded ore of varying quality during the last three months. The body is 3 feet wide and 40 feet long, and runs \$30 in gold to the ton, but there is a streak within it that assays \$600 to the ton when sorted. This body has been worked from the floor of the drift to the surface.

Hadley & Frizzell have put up an experimental cyanide plant on the Fluorine claim, north of Cripple Creek.

At the Sitting Bull mine, on the northeast slope of Battle mountain, near Cripple Creek, the ore body is opened up by lessees at a depth of 225 feet, and they have drifted on the shoot for 100 feet, showing an average width of 3 feet of smelting ore. Along the hanging wall there is a streak 6 inches wide running \$300 a ton.

The Elkton Con. M. Co. at Cripple Creek has granted a year's extension of the lease on the Tornado mine to W. H. Clements. Shipments average seven carloads of ore each month, all of smelting grade.

The Colorado Springs Telegraph says the failure of Stratton's Independence Co. at Cripple Creek to prospect the 1400-foot level of its property is explained by J. H. Hammond, consulting engineer, in a report made to the London officials, in which he states the volume of water at that depth interfered with operations. This condition will be obviated by increased boiler power, which will be devoted to pumping. Stopable ore has been opened on the Emerson vein on the 960 and 1050 levels. This is the lowest depth at which the Emerson vein carries pay ore as far as developments extend. Manager Cornish will increase the boiler capacity at cost of \$10,000.

On Copper mountain, near Cripple Creek, the Fort Wilcox Co. have driven a tunnel 900 feet, but at present they are following a vein, which has been found in the Fluorine. A crosscut was driven into the Fluorine at a point 700 feet from the portal of the Fort Wilcox tunnel. This crosscut has been extended 200 feet. Two air drills are used. Two shipments were made last week, one each from the Fort Wilcox and Fluorine claims. This ore is low grade.

It is reported a strike has been made in the Lincoln mine, a mile west of Gillett, showing at a depth of 600 feet a vein 4 feet wide, which gives \$70 gold per ton.

Shipments of ore have been started from Carbonate hill, near Cripple Creek, the new shipper being the Buckhorn claim, operated under lease by Wiley, Emmert & Chase. The shaft is down 100 feet. They have opened and prospected two veins, one northeast by southwest and an east and west vein, and at the juncture of the two veins they are breaking 20 inches of ore that runs \$40 gold per ton.

The Rhyolite Beacon M. Co., composed of local men, has organized at Cripple Creek, with E. E. Miller as manager, to operate on Rhyolite mountain, near Cripple Creek. The company owns nineteen and one-third acres surface area and has twelve additional acres of underground rights, also a group on Rose Bud hill. There is a shaft down 60 feet on the Rhyolite, which will be continued.

J. E. Smith, having a bond and lease on the Brigadier mine on Raven hill, Cripple Creek, began ore shipments last week. He also has a lease on a block of the Abe Lincoln and on the Ida May.

The Princess Alice Con. G. M. Co. at Cripple Creek have bought control of the Bonnie Nell Co. for \$75,000, and have bought the Abe Lincoln claim, containing five acres, for \$30,000.

IDAHO.

BANNOCK COUNTY.

The Scott G. M. Co. has incorporated at Deseret, Utah, by C. J. Thomas, H. Duncan, D. T. Duncan, to work the Tipover, Mary Jane, Conglomerate and Carbonate Hill lode claims, near Pocatello.

CASSIA COUNTY.

Development work has resumed on the Golden Eagle mine, 10 miles south of Al-

blon, which is owned by S. P. Weatherman of Pocatello and O. H. Melcher of Albion.

CUSTER COUNTY.

R. Macbeth has bonded the interests of W. T. Oster and A. C. Allen in the Shakespeare mining claim on Loon creek, near Mackay, for \$7500. The Shakespeare joins the Lost Packer on the east.

IDAHO COUNTY.

The Champion group of mines in Elk City district were sold recently to the Thunder Mountain G. M. Co. of Philadelphia, Pa. The group consists of nine claims on Crooked river, 9 miles from Elk City. A tunnel is in 140 feet, giving a depth of 100 feet; the ledge is 5 feet wide and average assays run \$15 in gold. The ore is free milling. As soon as the roads are in shape the company will ship in a 10-stamp mill.

The United Gold Ledge M. Co. of Idaho has been organized by New York and Chicago men under Arizona laws, with headquarters at Chicago, Ill., to operate in Thunder Mountain district, near Roosevelt. G. W. Dorgey is president. They have a number of properties in Thunder Mountain district, also in Big Creek district. They bought a group of claims on Smith creek, a group on Fall creek, near the Dewey mine, also a group of six claims near the Fairview. T. Van Meter of Welser is superintendent.

KOOTENAI COUNTY.

G. H. Clarke of Spokane, Wash., part owner of the Josephine group in Metaline district, has resumed work. The shaft will be sunk and a crosscut driven. At depth of 50 feet the ledge is 50 feet wide, with average assay values of 20% in lead and some silver. The camp has heretofore been hindered by insufficient transportation facilities, boats being unable to get through the Box canyon. There is money now available from the Government appropriations for the improvement of the Pend d'Oreille river. With an open waterway the freight rates will be reduced.

OWYHEE COUNTY.

F. G. Clark of Salt Lake City, Utah, superintendent of the Palmer-Holland groups on Florida mountain, near Silver City, has started work on these mines, which have been sold to the Trade Dollar Extension M. Co. of Salt Lake. W. C. Orem is manager. He will first run a tunnel to cut the Holland mine 100 feet deeper than the point where the ore was taken out by the lessees last fall. It is then proposed to open the properties by a tunnel from a point near Jordan creek, below Black Rock gulch.

SHOSHONE COUNTY.

W. Mather and N. McDougall are hydraulicking in American gulch, near Delta. Adjoining American gulch is Montana gulch. There is a mile of flume and ditch, by which water is brought from Potosi. There has been so much water in Potosi creek that Kingman & McDougall have been unable to drift on their placer ground, which yields \$5 to the set. Coulson & Heustis have put their Trail creek placer property into working order and started booming. They report finding it 20 feet to bedrock, and the entire amount of sand, clay and gravel above bedrock will be moved by the use of the boom. W. Gilliland is running his boom on upper Trail. He reports the grade of gold next to the hill is better than that in the middle of the old channel. The dredger on Lower Beaver, on the Pritchard ground, is running. A. M. Hill, owning the Roy group of claims on Upper Beaver, is doing work in the south tunnel in the direction of the Toughnut. He will drive 400 feet, a total of 1000 feet.

The litigation between the Yolande M. Co. and the Gold Hunter M. & S. Co., operating adjoining claims at Mullan, has been settled by the Yolande M. Co. deeding all of its rights to Larson & Greenough of the Morning mine (who were also interested in the Yolande) for \$20,000. The entire Yolande property was turned over to the Hunter Co. for \$38,000. The Yolande was being worked through the Hunter, and it was claimed that nearly all the high-grade ore which was being taken out was coming from the Yolande, and an injunction was served on the Hunter to keep them from taking out more ore from that ground. The Hunter group consists of eleven full claims, four millsites and two water rights.

The Moonlight M. Co., operating eight claims above Burke, filed articles of incorporation last week; J. Murphy, W. H. Smith, E. Hedin, J. and P. Kennedy, P. Lambert, F. Stroh of Burke and C. H. Betts of Wallace. Drifting and tunneling have been done.

MICHIGAN.

Lake navigation was reopened last week, the first shipment going from Dol-

lar Bay, the Osceola taking a cargo of copper wire from the mills there. The Calumet & Hecla shipments have begun from Portago Lake docks.

EMMET COUNTY.

The conglomerate in the Porcupine Mountain district, near Carp Lake, has been located. For twenty-five years samples of rich conglomerate have been found there, all being float copper, however. The lode is now reported found in the south or porphyritic range, whereas all former search had been confined to the north range, or the Carp Lake sandstone formation.

HOUGHTON COUNTY.

Improvements are being made on the plant of the Lake Superior Concentrating Co., which is operating on the Franklin sands, near Hancock. An engine has been placed which will develop 240 H. P. for driving the washing machinery.

The automatic stokers at the Champion, near Houghton, are in operation.

The strike of the trammers at the Wolverine mine, near Hancock, resulted in the return from Arizona of Superintendent Smith last week, and those who had accepted the offer of the assistant superintendent of \$56 per month (the same as paid at the North Kearsarge) immediately asked for another advance to \$58. This was refused and the men went out. The entire mine is tied up and the miners have been notified that operations will cease until the trammers return. The miners are not in sympathy with the strike.

The work of removing No. 2 shaft and rockhouse from the Arcadian to the Tri-mountain No. 4 shaft, near Hancock, began last week. The structure is of steel. The Douglass shaft is the only one that is being worked at the Arcadian. The steel shaft house still remaining at No. 1 shaft may eventually follow the others to Tri-mountain. The third head of the mill is stamping rock.

The Red Jacket shaft of the Calumet & Hecla at Calumet is shipping 650 tons of ore daily. The output will be increased during the year by changes in hoisting methods.

KEWEENAW COUNTY.

The engine and boiler equipment for sinking the Allouez shaft on the Kearsarge lode, near Allouez, is being set up. The Ahmeek crosscut to the lode is expected to strike the latter this week.

ONTONAGON COUNTY.

The management of the Michigan mine has contracted with the Mass for the use of one head at the Mass mill, at Mass City, for six months. The Michigan will begin sending rock over the Mineral Range road as soon as 2½ miles of track can be laid to the mine.

Superintendent Brady of the Michigan mine, near Mass City, says sinking at "B" shaft has reached the thirteenth level, which, from appearances, is 50 feet below the point of contact of the Branch and Minnesota veins. The bottom openings of the Branch vein are producing mass copper. The contact of the two veins is expected to be reached next week. Foundations for the shaft and buildings are finished and the new hoist for "A" shaft is on the ground.

The remodeling of the Adventure mill, near Mass City, by the original contractors to make good the defects in the first construction has been completed, and all three heads are in operation. The mineral yield is reported improving.

The location of the Baltic lode on section 16, owned by the Atlantic M. Co., near Houghton, is said to be still in doubt. The vein may be among those cut by the crosscut, but, if so, was not recognized, and it is thought the solution of this problem is in the extension of one of the Baltic drifts north of No. 5 shaft to the Atlantic group.

MONTANA.

CARBON COUNTY.

The Bear Tooth Coal Co. has been incorporated by Red Lodge men to exploit the coal measures near Red Lodge, which the company has leased.

CASCADE COUNTY.

Butte advises report the Montana Coal & Coke Co., near Belt, is operating 240 ovens; that its receipts have increased from \$650 to \$1000 per day. The washer is working satisfactorily and the company has an ample supply of water.

CHOTEAU COUNTY.

Oil is reported 25 miles from Havre by J. C. Griffin.

CUSTER COUNTY.

L. Eaves, of Butte, who has a lease and bond on the Southern Cross mine, near Georgetown, says he is putting in machinery. The Southern Cross is owned principally by H. L. Frank of Butte.

DEER LODGE COUNTY.

A smelter is to be erected in the Moose Lake district, near Anaconda, says J. J. McCaffrey, manager of the Moose Lake Smolting Co.

FERGUS COUNTY.

The New Mine Sapphire Co. has bought the Baker, Snowdrift, Clayburg, Gunn and Hoover sapphire claims in Yogo district, near Lewiston, says the Argus.

Manager H. J. Kendall of the Kendall mill, at North Moccasin, near Lewiston, says they have put in an electric elevator belt which solves the problem of removing the tailings from the mill. The tailings had piled up several feet in the gulch until they reached a point on a level with the troughs through which they were conveyed from the solution tanks. The plan is to dump them from an elevation of 20 feet. The elevator belt carries them from a tank in which they are washed from the solution, to a trough at the elevation above mentioned, through which they flow a safe distance from the mill into the gulch.

FLATHEAD COUNTY.

There will be at least three oil companies sinking wells in the Kintla Lake fields, near Belton, this season, says the Inter-Mountain. Butte Oil Co., Kintla Lake Oil Co., and the Pacific Oil Co., the last named being composed of Kallispell parties. The Butte Co. have a well down to a depth of 1100 feet.

GALLATIN COUNTY.

The Bozeman Onyx Co., organized last week at Bozeman, O. P. and C. Chisholm and R. D. Chisholm. This company owns eighty acres of land 4 miles north of Manhattan, on which is located a deposit of onyx, and development work will begin this month. A road will be built from the property to Manhattan to facilitate hauling in machinery.

GRANITE COUNTY.

The Montana G. M. Co., operating the Sunday mine at Royal, last week shipped its regular weekly bar of gold to the U. S. assay office at Helena. The bar was valued at \$3700 and was the result of a week's run of a five-ton Huntington mill.

LEWIS AND CLARKE COUNTY.

The Golconda G. M. Co. has been incorporated by Chicago, Ill., and Helena men, to work the Golconda group in Jay Gould district, which adjoins the Jay Gould and Homestake mines. There are 3000 feet of tunnel and laterals and a 10 stamp mill. Development will be pushed with a view of operating the mill this season. The company will erect a cyanide plant.

W. Parker is preparing to resume dredging operations at the head of Alder gulch, near Marysville, by May 15.

PARK COUNTY.

The reorganization of the Bear Gulch and Revenue properties at Jardine (the Kimberly-Montana M. Co.) has started the Revenue 40-stamp mill, and men have been put to work in the mines. The cyanide plant being built in connection with the new stamp mill is nearly ready to work on the tailings from the mills.

SILVER BOW COUNTY.

The Kendall Chronicle says F. A. Heinze is working two mines at Butte, the Rarus and the Cora. The former is said to be yielding 1000 tons of 6% copper ore daily and the latter 500 tons per day. The ore of the Cora runs 4% copper and some silver. There is also some silver in the ore of the Rarus. With the exception of the first-class grade, all of the product of the two mines is sent to the concentrator at Basin, where it is run through the crushing and concentrating machinery and then returned to the smelter. The ore of the Rarus averaged only 3% in copper for some time, but the grade was increased by adding some of the richer ore, a shoot of which each of the veins contains.

The Emma mine at Butte has closed down for the present.

NEVADA.

ELKO COUNTY.

Superintendent W. D. Higginson of the White Rocks placers, near Elko, says work was started this week.

EUREKA COUNTY.

F. L. Hook, of Salt Lake City, Utah, has bought a one-third interest in a group of copper mines near Eureka, owned by J. A. Hunt, H. Kohn and E. B. Johnson. The group consists of eight lode claims and two water locations on the east side of Diamond valley. A tunnel is being driven.

LINCOLN COUNTY.

B. F. Lewis of Los Angeles, Cal., manager of the Parallel G. M. Co., operating near Searchlight, says development work

will be increased on their group, which consists of four claims. So far most of the work has been done on the Elvira and the Birdie. A contract has been let for drifting on the 100-foot level of the Elvira and to sink the shaft down to the 200-foot level.

V. A. Macdonald of the Providence Exploration and Development Co. of Providence, R. I., says his company has bonded the Howard-O'Connor group at Newberry, near Searchlight.

Manager Lane of the Horseshoe mine at Fay says machinery is being set up and operations are expected to resume May 15.

NYE COUNTY.

The Ordah-Tonopah M. Co. has been organized, with C. E. Watson as manager, and owns seven claims 1 mile south of the Mizpah at Tonopah. It is intended to sink a shaft on the Wonder claim.

A steel gallows-frame, 65 feet high, is being constructed at the Slebert shaft by the Tonopah M. Co., at Tonopah, and is expected to be ready for operation next week. Plans for the reduction works are being perfected. The station at the 700-foot level of the Slebert has been cut and the crosscut started.

A. L. Hudgens, owning a one-fourth interest in the Bennett group of eleven claims adjoining the Hasbrouck group on the east, at Gold Mountain, near Butler, made the first payment last week on the purchase price of \$30,000 for three-fourths of their three-fourths interest. The Millbrae M. Co. has been formed to work the property. F. D. Neckerbocker is superintendent and manager.

At the Boston Tonopah, at Tonopah, the machinery is in place, including a 50 H. P. steam hoist and a 5 H. P. gasoline engine for running the blower.

The Halifax shaft, at Tonopah, is down 500 feet, and at 600 feet they will start crosscutting both north and south.

STOREY COUNTY.

The shaft buildings and gallows frame at the New Forman shaft, at Gold Hill, were totally destroyed by fire on April 21st. After burning an hour the gallows frame fell into the shaft and set the timbering on fire. This will probably cause the most serious loss, as this shaft was used to ventilate the south-end mines, and if it caves, air for that section will be shut off. The origin of the fire is unknown. The building was one of the most expensive of the hoist plants on the Comstock, and could not be duplicated for \$50,000, says the Journal. A hoist engine and pump were also in the wreck.

WASHOE COUNTY.

At Olinghouse, near Wadsworth, the Slip mill began crushing ore last week. The Jumper has twenty tons of ore sacked and in the bin, and has started an upraise from the 150-foot level.

WHITE PINE COUNTY.

It is reported P. H. Cannon & Co. will erect a 20 stamp mill at the Exchequer mine at Cherry Creek.

Machinery for the Fortuna Grande C. Co., operating the mines at Pilot Knob, near Ely, is on the ground, including a 60 H. P. boiler, a hoisting engine, a pump with 7-inch discharge, 300 feet of 7-inch pipe and several hundred feet of 4-inch steam pipe, all of which will be placed at the Giroux shaft of the Old Glory. When these are in place the shaft, down 350 feet, will be sunk to the 600-foot mark.

NEW MEXICO.

GRANT COUNTY.

H. C. Begole and J. C. Boyd of St. Louis, Mo., having an option on the Ashton and Roach mines (the Wildcat group) at Santa Rita, began operations this week. The mine will be developed by sinking the double-compartment shaft to a depth of 500 feet and connecting with the ore body by drifts. The mill will be overhauled, the Huntingtons removed and two additional rollers with screens put in. The floor space will be increased and several concentrating tables added.

The National G. & S. M. Co., operating at Stein's Pass, propose to erect a concentrating plant.

The main shaft of the Aberdeen, near Lordsburg, is being timbered its entire 300 feet. When this is completed a pump will be put in and a crosscut driven to the vein.

M'KINLEY COUNTY.

The Weaver coal mine at Gallup last month produced 40,000 tons of coal.

RIO ARRIBA COUNTY.

Frank Bros. of Denver, Colo., are boring for oil in the gulch below the Coyote coal fields on the Santa Fe Central Railway, near Coyote. They are down 900 feet.

In Bromide district, 15 miles west from Tres Piedras, on the Antonito-Santa Fe branch of the Denver & Rio Grande Rail-

road, and 25 miles south of the Colorado State line, the Nahama Leasing Co. of Creede, Colo., are operating on the Bromide mine.—The Tampa mine is being worked by the Tusas Peak G. & C. Co., and they have a 12-foot vein, 6 feet of which is shipping ore. The Tampa is on the north slope of Tusas peak, near Cunningham gulch, Bromide district, and the shaft is being sunk below the 150-foot level, the vein being opened up by crosscuts and drifts at the 50, 100 and 150-foot levels. The company has bought a mill-site on Las Tusas creek and will build a mill this summer.—The War Eagle, owned by the Mexican King G. & C. M. Co. of Milwaukee, Wis., near the Tampa, has opened up at the 60-foot level a 4-foot vein of copper sulphides, assaying 15% copper. The shaft is being sunk.—The Continental is taking out galena, with silver values of forty ounces per ton.—The Copper mountain tunnel site, controlled by the Pontiac M. Co., on Kiowa mountain, has a tunnel in 400 feet, with 100 feet of drifting on the vein, which shows a large body of ore carrying 4% copper.—Other companies operating in Bromide district are the Lady Gay group, the Copper King (owned by the Anaconda-Eureka M. Co.), the Strawberry group, the Princess group, Payroll and the Whale (owned by the Belle Royal M. Co., who are putting in a steam plant of machinery).

SIERRA COUNTY.

A strike of gold ore, running \$100 to the ton, is reported made in the south 100-foot level on the Log Cabin at Tierra Blanca.—The South Percha M. & M. Co. report opening up ore on the Great Eastern on the South Percha. The property is crossed by two leads running parallel to and 60 feet apart. The tunnel being run on the Stuck lead is in 190 feet and showing both milling and concentrating ore. A crosscut has been started to tap the other (the Mosey) lead.

C. M. Root & Co. have bonded the Happy Jack mine, at Andrews. There is a supply of ore on the dump and the Andrews mill has been leased.

A. H. Hilton has bought 800 acres of coal lands at Carthage. There are three developed mines on the property and shipments are being made.

OREGON.

BAKER COUNTY.

F. D. Smith, managing director of the Oregon Mines & Exploration Co., operating the Snow Creek mines in Greenhorn district, near Sumpter, says the vein on the west 70-foot level was crosscut last week, showing a width of 8 feet in ore, assaying \$60 a ton. A stringer of 12 inches from the main ledge of high-grade ore was struck. Drifting on the ledge and blocking out ore preparatory to the installation of a mill is under way. The mill will be built this summer.

The Bear Gulch placers operated by the Hobson Mercantile Co. of Sumpter started up last week, says the Miner. The Hobson Co. has quartz prospects on Deer creek which are also to be worked this season.

The owners of the Morning mine—Ames, Cooper & Simmons—are building a mill at their mine near Sumpter.

The Midway mine, near Sumpter, is to have a hoist, says the Miner, with a capacity for sinking to a depth of 1000 feet. A compressor will also be put in, and steam capacity to operate both. It was found in crosscutting the lode that little depth was being gained, and that a deeper tunnel on that part of the ground would be too expensive, so much so that a sinking plant was decided on. The hoist will raise 6000 pounds 1000 feet in a minute.

A. Geiser, superintendent of the Midway M. Co., in Cracker Creek district, near Sumpter, says a 4-drill air compressor, a 125 H. P. boiler, feed pumps, an electric lighting plant for the mines, a cylinder hoisting plant with a capacity of 1500 feet depth, together with accessory machinery, will be ordered and installed this spring. At the Gold Pan on Huckleberry mountain, of which Geiser is also superintendent, a hoisting plant with a capacity for 500 feet depth is being set up.

CLACKAMAS COUNTY.

F. C. Barstow reports finding coal on his claims near Wilhot Springs, 25 miles east of Oregon City, in the foothills of the Cascade mountains.

GRANT COUNTY.

It is reported that the management has decided not to build a tram from the Bull of the Woods shaft to the Badger concentrator, as previously planned, but will put up a separate and independent mill, as development work has shown an increase of values.

W. C. Rutter of Seattle, Wash., president of the Klitting M. Co., operating near Granite, says development work on

the Big Four group continues and final payment has been made. It is expected to put up a mill this summer. G. J. Barrett is manager.

The Prairie City Miner reports cobalt ore found in the mines of Toner & Walling, owning an extension of the Copperopolis.

SOUTH DAKOTA.

CUSTER COUNTY.

A vein has been discovered on the Granite Reef, 3 miles from Custer. J. Demereau struck the vein while doing assessment work. The vein is 6 feet wide, cutting the formation at right angles.

LAWRENCE COUNTY.

(Special Correspondence).—The tin mines at Tinton, on Nigger hill, are being developed with good prospects. The tin ledges in this region are large, from 10 feet to 100 feet or more in width, and carry cassiterite and some of them gold. A great deal of development work has already been done. In the early summer the Tinton company will build a concentrating mill of 100 tons capacity. M. H. Lyon is superintendent.

Tinton, April 24.

Lundberg & Dorr and A. D. Wilson have bought the Buxton mines in Bald Mountain district, 4 miles south of Lead City. The Buxton and Bonanza properties have been worked under lease by Lundberg & Dorr for several years. The deal includes the Cheator, Chlorinda, Pluto group, north of the Golden Reward mines. A cyanide plant will be built and the ore will be carried by gravity tramway from mines to mill.

A strike of ore of good grade in the quartzite level of the Cleopatra mine on Squaw creek is reported. The shaft some time ago encountered the lower quartzite and crosscuts have been driven east and west. The company will resume operations with the cyanide plant.

PENNINGTON COUNTY.

The Burlington M. Co. has been organized at Deadwood. They have bought the York and Crain groups of claims in Friday Gulch district, northwest of Hill City; J. L. Bently, N. T. Mason, A. Hattenbach, H. S. Vincent, W. S. Elder, J. W. Taylor, C. Miller. There are 118 acres of the ground and some development work has been done. It is at the head of Friday gulch, covering a portion of the Rochford placer belt. They will work both the placer and ledge deposits.

The Columbia G. M. & M. Co. has completed a \$7000 plant at the mine near Rochford, and sinking has resumed in the shaft, which will go to a depth of 200 feet, when crosscutting will begin. The plant consists of a steam hoist, 100 H. P. boiler, air compressor, drills and plant for electric lighting. Developments at the Golden West continue encouraging. The main shaft is being sunk below the 100-foot level, and another station will be cut and a crosscut driven to the vein. The company has a sawmill at work on the property, turning out lumber for buildings.

TEXAS.

EL PASO COUNTY.

Manager Morehead reports tin ore on his group, 12 miles from El Paso and 6 miles from the railroad. It assayed 15%.

UTAH.

BEAVER COUNTY.

C. Baxter, manager and part owner of the Kitty Clough mine, near Milford, reports a strike made on the 100-foot level showing a 3-foot vein of gold-bearing iron, averaging \$17 in gold per ton. The Kitty Clough adjoins the Vicksburg group of the Majestic Co.

At the Old Hickory mine of the Majestic Co. at Milford the electric drill plant is being put up, including a 20 H. P. gasoline engine and 22 H. P. dynamo. The shaft and tunnel are being wired. The working shaft is down 200 feet and the tunnel is in 220 feet, with some distance yet to drive to strike the shaft.

A. B. Lewis last week bought the Campbell estate's interest in the Monitor, Red Warrior and Florence groups, in Star district, near Milford, says the Milford Times, for \$55,000. It is reported the Atlas group has been added to the company's holdings. C. H. Smith, at the Copper Mountain, reports the hoist being placed. Material for the smelter is on the ground. Contractor Halterman has struck water in the artesian well at the smelter, at a depth of 470 feet. The flow at the surface is small, as this well was sunk on higher ground than the Lewis well, but at depth the flow is 60,000 gallons daily. A tank will be put in from which the water will be pumped. As the smelter management desires a supply of 100,000

gallons daily, another well will be sunk within 50 feet of the first.

The mines of the Wild Bill M. Co., near Shauntie, are under option to J. W. Taylor, of Salt Lake City, manager of the Ima M. Co., with whom are associated J. F. Hatcher and G. F. Twitchell, of Columbus, O. The same parties control the interests of the Hub M. Co. in this district, between the Wild Bill and the Majestic.

JUAB COUNTY.

D. D. Hanks, J. Larsen and A. Bray have taken a lease on the 1000-foot level at the Bullion-Beck mine, near Eureka.

Superintendent C. Wheeler is unwatering the South Swansea mine, near Eureka.

President J. M. Higley of the Joe Daly M. Co., operating in Tintic district, near Eureka, says they have arranged for the use of the Undine tunnel with which to continue the exploration of its ground.

Manager Wheeler is unwatering the South Swansea mine, near Eureka.

PIUTE COUNTY.

(Special Correspondence).—The mine of Moore & Mathews, on Deer creek, has been sold to Salt Lake men.

The L. & N. group of fifteen claims in the Ohio Creek mining district, owned by Nielson & Orrick, and on which J. F. Mount of Richfield has a bond and lease for \$50,000, will be taken up and operations commenced.

G. F. Dalton, manager of the Gold Vein M. Co., will begin work as soon as supplies can be gotten in.

M. P. Braffett, secretary and treasurer of the Gold Fissure Co., and G. W. Snow are surveying the properties owned by this company.

The Iron mine, east of Marysville, is working and will ship a carload of ore daily. The returns from shipments recently made were satisfactory. F. E. King is superintendent.

The Gold Queen, at Deer Creek, has started up for the season and will employ a large number of men.

The Copper Butte is working night and day shifts on a tunnel.

Marysville, April 25.

SALT LAKE COUNTY.

Superintendent E. McCarrick reports copper ore struck in the Fridi mine at Bingham.

W. S. Hall, superintendent of the Copper Belt railway at Bingham, says within eighteen months the camp will be sending to the valley smelters at least 120,000 tons of ore per month, the increase to be contributed to by the Yampa, the Boston Con., the Highland Boy Con., the Dalton & Lark and a number of others. At present his line is handling 350 tons of ore daily. The Kempton sent this week a 300-ton lot, while the Storey management is loading 200 tons, with several smaller shipments to follow.

W. Hatfield of Salt Lake City, manager of the Albion mine at Alta, says a sufficient flow of water is in the streams to supply the power plant and it will be placed in commission again next week, and development work resumed in the mine.

The Godbe Agitating Cyanide Process Co. has been incorporated at Salt Lake City by E. L., A. H. and M. C. Godbe, G. N. Lawrence and S. D. Wertheimer.

Manager G. H. Robinson of the Tintic M. & Dev. Co. says preparations are being made for the construction of a mining plant at the Yampa mine at Bingham.

Manager D. McVichie reports the volume of water escaping from Mascot (Dalton & Lark) tunnel at Bingham has been lowering the flood in the Dalton ledge at the rate of $\frac{1}{2}$ of an inch daily. The flow is at the rate of 2300 gallons per minute. Ultimately the tunnel will drain at depth more than twenty miles.

Development work has been resumed at the Kempton mine, near Bingham, and shipments are in progress, two carloads of ore from the dump having been delivered at the railroad last week. Six teams are employed, and the tonnage already at surface and what is coming from the mine is being sent down at the rate of sixty tons daily.

A strike is reported made in the Wheeler & Wilson mine, near the head of Big Cottonwood canyon, near Alta, the ledge being tapped at a depth of 1000 feet below the outcrop. Manager W. C. Tracy says the tunnel, which is in 150 feet, is nearing a shoot of ore and the mine will develop into a regular shipper by June 1.

Last week the Silver Shield Co. at Bingham, which is extending the Franklin (Niagara) tunnel by permission of the United States M. Co., broke into its own territory at 4800 feet from the tunnel's mouth. Following the vein the tunnel is running on 2 feet of copper-iron ore. This tunnel will also drain their workings.

The directors of the New State G. M. & M. Co. at Salt Lake City have decided to put in a 50 H. P. steam hoisting plant, including a geared hoisting engine, 60 H. P.

boiler, 10 H. P. engine for dynamo duty. F. L. Hoock and J. Dederich are interested with Eastern men. The group is 14 miles southeast of Salt Lake City, between Little and Big Cottonwood creeks, near Alta, with a down-hill haul of 5 miles to the railroad.

Manager C. K. Roland of the Hogg-Swayne Oil Co., of Houston, Texas, says they have bought 12,000 acres of oil lands extending north of Salt Lake City along the lake, from the mouth of Jordan river to west side of Promontory. Development will begin this month.

The properties of the Sampson M. Co. at Bingham have been taken over by the Bingham C. & G. M. Co., and in future will forward their entire output to the furnaces of that company in the valley.

The Mohave C. M. Co. has been incorporated, with headquarters in Salt Lake City; J. C. E. King, G. H. Smith and V. E. Huntzicker.

SUMMIT COUNTY.

It is reported plans have been drawn for a mill to be built at the mouth of the Alliance tunnel, at Park City, for the Kearns-Keith M. Co.

Manager Turner of the J. I. C. mine, at Park City, has decided to sink the shaft an additional 200 feet, making a depth of 700 feet.

UTAH COUNTY.

Work has resumed on the mines of the American Fork M. Co. at American Fork, says Manager M. Fridel at Salt Lake City.

W. L. Goodsell, manager of the Goodsell mines, near American Fork, says he has begun shipment of ores that have accumulated during winter development.

J. A. Jacobson at Santaquin, managing development work on the Crown Jewel group of claims under option, says the shaft is down 50 feet, the vein showing the full width of the shaft, and carries values of 20% lead, 24 ounces silver and \$2 gold.

WASHINGTON.

FERRY COUNTY.

J. Fitzwilliam, superintendent of the Zala Con. at Sheridan, says he is running three drifts southward on the vein on the 100, the 300 and an intermediate level, and is preparing for stoping. Shipments will begin next week. Where the ledge is narrow the ore requires but little assorting. The ore is first gouged out and then the footwall is broken the regular size of the drifts.

SPOKANE COUNTY.

It is reported at Spokane the American S. & R. Co. will build a smelter there to handle both lead and copper ores and have a capacity of 600 tons a day at the start. D. C. Johnson of the East Helena smelter says the site is still somewhat unsettled. Spokane and coast points are being studied before a decision is made. The coast points claim superiority because of their accessibility to tide water and the consequent cheap transportation. Coke and coal are abundant along the coast. On the other hand, Spokane is the natural center of the mining camps, with the Coeur d'Alenes, Rossland, the Boundary, Republic, the Slocan, Baker City and the Pend d'Oreille, and Crow's Nest coke.

STEVENS COUNTY.

Northport reports say the Le Roi smelter is on the eve of another shutdown, unless the coke problem is at once solved. There is enough to run three furnaces until the 4th inst. The supply from the Sound is of such inferior quality that Virginia, Superior or Fernie coke is necessary to use with it to keep the furnaces running. Several thousand tons are being sent from the East and the Sound, but several days must elapse before any can arrive. Considerable anxiety is felt regarding the Great Northern strike. Matters are in such a shape that a tie-up on that system will have the same result on the works.

Thirty-two feet of high-grade hematite are reported opened on the Iron Hill mine, which has been in operation under Great Northern management for several months past. The mine is 10 miles west of Valley, on the Spokane Falls & Northern Railway.

WYOMING.

SHERIDAN COUNTY.

Both mines of the Sheridan Coal Co. at Dietz, 4 miles west of Sheridan, are shut down, as a result of a strike, and 200 men are out. The miners have but recently organized and a demand was made on Superintendent Kennedy that the union be recognized. The demand was made by a committee several members of which were not in the employ of the company at the time, and Kennedy refused to treat with them. No grievance was presented to him.

SWEETWATER COUNTY.

The Sioux City & Rock Springs Coal

Co., with headquarters at Sioux City, Iowa, has been incorporated. The property of the company is 25 miles east of Rock Springs, and the main works are within three-quarters of a mile of the main line of the Union Pacific Railroad, comprising 800 acres. Three veins have been developed 4, 7 and 20 feet in thickness, being separated by strata of sandstone. The officers are H. D. Brown, E. A. Conway, A. Holt, L. O'Harrow, H. R. Prairie, E. D. Waterman and A. B. Kiler.

UINTA COUNTY.

The discovery of gold is reported in the Teton mountains, south of Yellowstone Park. The formation is described as Archean schist, with overlying sedimentary beds, similar to the Black Hills of South Dakota, and portions of Colorado. The strike is said to have been made 6 miles east of Victor, and 100 claims are taken, though there are several square miles of territory yet unprospected. Gold can be panned from surface soil and an outcrop of quartz is reported as assaying \$9 per ton.

FOREIGN.

AFRICA.

RHODESIA.

Bonsor Gold Co. report March output: Forty stamps ran twenty-nine days, crushed 4000 tons, producing 1127 ounces; treated by cyanide 3700 tons, yielding 497 ounces. Globe & Phoenix Gold, during March, thirty-five stamps ran 28 1/2 days, crushed 5816 tons of ore; duty per stamp per day 5.76 tons; yield 2263 25 ounces bullion; tallings assay 2 397 dwt. fine gold; cyanide, tons treated, 3150; yield 459.4 ounces bullion. Rezende, March result: Twenty stamps, running twenty-seven days, crushed 3025 tons, yielding 896 ounces fine gold; recovered from tallings by cyanide eighty-five ounces fine gold; twelve tons concentrates produced, containing forty-eight ounces fine gold. Warleigh (Rhodesia) Development, April 8: Guinea Fowl main shaft down 240 feet; driven on second level, 500 feet; reef 2 feet wide, averaging one ounce gold per ton; reef in the winze to third level, 3 feet wide, averaging 2 ounces per ton. Black labor is plentiful.

The total gold output of companies making returns to the Rhodesian Chamber of Mines at Bulawayo for the month of March, says the London Mining Journal, amounted to 19,626 ounces, an increase of 2536 ounces as compared with the previous month, and an increase of 2735 ounces as compared with the corresponding period of 1902. The monthly returns for 1903-02 have been as follows:

	1903.	1902.
January.....	16,245	15,955
February.....	17,090	13,204
March.....	19,626	16,891
April.....		17,559
May.....		19,698
June.....		15,842
July.....		15,226
August.....		15,747
September.....		15,164
October.....		16,849
November.....		15,923
December.....		16,210

TRANSVAAL.

Cassel Coal Co., March output, 8268 tons. Crown Deep, March results: One hundred and ten stamps, working twenty-eight days eighteen hours, crushed 15,004 tons; yield 3139 ounces fine gold; 10,430 tons of sands and concentrates treated by cyanide works, yielding 2265 ounces; 3799 tons of slimes treated, yielding 275 ounces. Estimated profit, £8100.

Durhan-Rodepoort Gold, March results: Quartz milled, 8550 tons, 70 stamps, 26 days, 4328 ounces; tallings treated, 5885 tons, 1373 ounces. Ferreira Deep, March results: 50 stamps, 29 days, crushed 7700 tons, yield, 3550 ounces; 5900 tons sands and concentrates treated cyanided, yielding 1476 ounces; 2275 tons slimes, yield 213 ounces. Geldenhuis Deep, for March: 150 stamps working 30 days, crushed 20,700 tons; yield, 5788 ounces; 14,238 tons sands and concentrates cyanided, yielding 2731 ounces; 6455 tons slimes, yield 526 ounces. Langlaagte Deep, for March: 75 stamps working 26 days 17 hours, crushed 10,837 tons, yield 2802 ounces; 8808 tons sands and concentrates cyanided, yield 1235 ounces; 2160 tons slimes treated, yield 112 ounces.

WEST AFRICA.

Ashanti Goldfields Corporation, for March: Obuassi mine, 580 tons yielded 1370 ounces, from development work, 2110 tons yielded 1110 ounces. Ashanti Sansu, March returns, 1120 tons, yielding 1350 ounces.

AUSTRALIA.

WEST AUSTRALIA.

Some of the leases formerly worked by the Challenge Gold Estates Proprietary

at Niagara, and abandoned, are becoming paying propositions in the hands of practical mining men. While the company held possession of the ground development work was confined to shallow prospecting, no effort being made to test the leases at depth.

NEW SOUTH WALES.

A rich alluvial find is reported from Ilford, near Mudgee, and over 200 men are on the field. Alluvial gold mining has been carried on in the district for fifty years; but this discovery is on Carwell creek, which had not hitherto been prospected.

The Araluen Central Gold Dredge report having won to date £17,772 in gold in their dredging operations.

In view of the advance in the price of lead, the British Broken Hill Co., at Barrier, has determined to reopen its mine, and when the price of lead increases still more several other mines will be reopened. The British mine has been practically shut down since 1901, as only a couple of men were employed in keeping the underground workings in repair. It is estimated that there are 160,000 tons of sulphide ore exposed in the mine.

VICTORIA.

The gold yield of Victoria for the past three months amounted to 182,265 ounces, showing an increase of 19,998 ounces, as compared with the corresponding period of last year.

CANADA.

ALBERTA.

A landslide of considerable extent occurred on the side of Turtle mountain at Frank, April 29th, said to have been caused by an explosion of fire damp in the Frank colliery. The slide buried a portion of the town, killing fifty-six people, and causing considerable other damage. The Old Man's river, which flowed through the center of the town, was dammed up with fallen rock to a height of 80 feet. Of seventeen miners at work underground, two died of suffocation and the other fifteen worked their way out, cutting through 30 feet of debris at one of the tunnels, the main entrance to the mine being completely blocked by the slide.

BRITISH COLUMBIA.

Plans are being drawn for a tramway from the Kootenay mine, near Rossland, to the Canadian Pacific Railroad, estimated to cost \$25,000, and will carry ore at 10 cents per ton. The distance to be covered is approximately a mile. Shipments to the smelter began this week. The available supply of teams being short, the management claims to have difficulty in contracting for the hauling of the tonnage it desires to ship even at \$1.25 per ton, which is higher than was paid last winter. The tram will start from the sixth level of the mine, to which adit all the ore broken in the stopes above can be delivered by gravity.

It is reported that the Great Western mine, near Rossland, will be unwatered, operations beginning June 1st. The mine has been closed down for two years.

Two more mines were added to the shipping list at Rossland last week—the White Bear and the O. K. The I X L mine has joined the working list, to be followed next week by the Jumbo, the Novelty and the Spitzee.

Instructions have been received by cable from London for opening up of work in Camp Mansfield, at the head of the south fork of Kaslo creek, near Kaslo, says the Nelson News. The Kaslo-Slocan M. Co. are the principal operators. The ore is largely free milling gold.

Manager D. W. McVicar of the E Pluribus Unum and Lancashire mines, near Greenwood, reports tellurides struck in the shaft of the former at a depth of 65 feet.

The Empress of India group, on the North Fork of Barrett creek, 4 miles from Ymir, has been bonded to J. W. Ross of Buffalo, N. Y., and work will begin this month. The group, which includes the Empress of India and Helena claims, together with four claims of the adjoining Monarch group, are located along a belt of gold-bearing porphyry and are 3 1/2 miles distant from the Porto Rico siding, on the Nelson & Fort Sheppard Railroad.

The Homestake group, on Pool creek, near Lardeau, has been sold to Managing Director W. B. Pool of the Ophir-Lade Syndicate for \$30,000, says the Rossland Miner.

The proposed Granby No. 4 tunnel at Phoenix will be 1000 feet long as a starter. In the Slocan, since Jan. 7, 1903, ten mines have shipped 2485 1/2 tons of silver-lead ore from Sandon, seven mines shipped 645 tons from McGulgan and ten mines shipped 999 tons from Slocan lake points. The Payne and the Ivanhoe, near Sandon, have shipped 733 tons of zinc.

Superintendent F. T. Hamshaw of the

McKee Con. Placer Co., operating on McKee creek, near Atlin, says he will put in a steam shovel to handle a daily average of 1000 cubic yards of gravel this summer. Preliminary prospecting is being done to determine the width of the channel by a series of cross drifts sunk to bedrock. It is not intended to do any hydraulic mining this season.—The Christopher group, below the ground of the Atlin M. Co., will be reopened this season, says Superintendent C. Hamshaw.

The Brook's property on Spruce creek, near Atlin, will be operated by Griffith & Loveridge for the Pine Creek Power Co., says the Atlin Claim.

The Canadian Smelting Works at Trail will add a department for the reduction of the zinc-silver-lead ores to its present smelting plant.

Work has been resumed on the Ruth-Esther gold mine on Sophia mountain, in the Trail Creek district, near Rossland, says J. O. Stout, part owner. The company expects to cut the ledge within the next 30 feet. The claims are near the Portland and the Velvet mines. The principal owners of the property are Goodeve Bros. of Rossland and C. C. Grove of Spokane, Wash.

With last week's ore shipments, the Granby mines at Phoenix have sent out 100,000 tons since Jan. 1 to the company's smelter at Grand Forks. The Emma mine, in Summit camp, rejoined the shipping list last week and this week the Snowshoe, the B. C. mine and the Sunset began sending out ore again. Total Boundary shipments for last week were 10,335 tons; total for the year, 152,664 tons. The Granby smelter treated 7903 tons with three furnaces in blast, making a total of 99,602 tons treated since Jan. 1.

In East Kootenay the mines at the Crow's Nest collieries are making good headway since the settlement of the strike. At Michel the output has reached a daily average of 1200 tons. The coke ovens are running full capacity. At Coal Creek the daily average output is 800 tons. No. 3 mine began work this week. Out of 424 ovens at Fernie 300 are in use. At Morrissey the output has reached 600 tons. A narrow gauge locomotive has been put on. The construction on the coke oven plants at Michel and Morrissey is being pushed. At the Coal Creek mines men are at work on the motor road connecting tunnels Nos. 4 and 5 with the tipples. These new mines will be developed this season. Trial drifts have struck the coal and permanent tunnels will be built. The power house for the electric plant at the Coal Creek mines is finished and the 250 H. P. engine is being set up. The power line from the plant to Fernie will be built this month.

The Ramher-Cariboo mine, near Rossland, has suspended operations pending the passage of the annual snowfalls. An effort was made to dislodge the slides with powder, but this failed. They will resume by June 1.

The Silver Cup mine at Trout Lake, near Lardeau, is sending out eight tons a day.

The rise of the Fraser river has stopped the working of the placer ground laid bare at Yale and other points on the Fraser.

Shipments from Rossland camp for the week ending April 25 and for the year to date are as follows:

	Week.	Year.
Le Roi.....	2,838	60,984
Center Star.....	1,688	25,868
War Eagle.....	1,080	18,030
Le Roi No. 2.....	840	7,839
White Bear.....	54	54
O. K.....	25	25
Giant.....		335
Velvet.....		2,166
Kootenay.....		225
Homestake.....		90
Totals.....	6,525	115,616

MEXICO.

CHIHUAHUA.

A. Marchand of El Paso, Texas, says he has bonded the Carolina mine, 12 miles east of Ahumada station on the Mexican Central and 81 miles south of El Paso. Work will be started this month. The ores are silver-lead.

The mill and aerial tramway of the Adela mine at Santa Barbara are in operation.

D. W. Shanks, of Los Angeles, Cal., has bought the Casualidad claim, 5 miles north of Parral and 200 yards from the Mexican Central railroad.

A. L. Rossen and H. S. Townsley have made a denouncement of a red hill 3 miles from Parral, believing it to contain cinnamon.

The Adela mine of El Oro Camp, near Parral, is shipping sixty tons of high-grade ore daily.

Seven and one-half feet of ore that runs 108 ounces of silver to the ton are reported in the La Iguana mine at Parral,

in the bottom of the 220-foot shaft. Ore is regularly shipped at the rate of twenty-five tons per day.

At Terrazas the San Salvador mine has been sold to J. W. McNeal of Guthrie, Oklahoma, for \$100,000 gold. The ore carries values in silver and lead.

The Dithridge-Burr Exploration Co. of New York has organized to operate at Parral, and G. A. Burr of Parral is vice-president and general manager. This company has taken over the Culentrillo mine, near the San Francisco del Oro mine, and fifty men are at work. It is a tunnel proposition.

The Hidalgo M. Co. is operating nine of its seventeen mines in Parral district, from which it is shipping 6000 tons monthly to the smelters.

COAHUILA.

The San Carlos Copper Co. has been incorporated, and, among other work, it proposes to construct a railroad from Linares, on the Gulf division of the Mexican Central, westward a distance of 125 miles to its copper mines, which are at San Carlos.

DURANGO.

The Santa Nino mine, near Durango, is reported shipping sixty tons daily to Smelter No. 3.

The Compania Minera de San Acasto has obtained from the Government a concession for the construction of a railway line from its mines near San Acasto to one of the stations on the line of the Mexican Central.

There are coal fields at San Pedro del Gallo which have been partially developed and the Penoles M. Co. of Mapimi will consider building a railroad from Mapimi into these coal fields to develop them, and at the same time insure to the mining company a good supply of cheap coal.

LOWER CALIFORNIA.

According to an official of the Boleo Co. of Paris, the Boleo copper mines, near Santa Rosalia, are turning out 70,000 tons of matte annually, which carries 40% copper. The company employs 200 men at the mine and smelter. A regular line of steamers run between Santa Rosalia and Guaymas. The matte is shipped to San Francisco, Cal. The company has a railroad in operation, and it is expected a road will be built across the peninsula to connect Santa Rosalia with another mine recently bought.

MEXICO.

(Special Correspondence).—The El Oro mines are located in the Talpajahua mining district on the line of the State of Michoacan. The company is preparing to increase its plant by adding 100 stamps, making a total of 200 stamps. The ore at present exposed in the San Rafael vein is reported to be 1,000,000 tons, which can all be worked profitably. It is expected the mill will be in operation within eighteen months, contract for which has been let. The company has accepted an offer from Charles Butters & Co. of London, who have agreed to erect a plant capable of treating 200,000 tons of tallings, at the rate of 15,000 tons per month. R. M. Raymond is the general manager of the company. Talpajahua, April 25.

At El Oro, on the border between the States of Michoacan and Mexico, the El Oro M. & Railway Co. is putting in a second 100 stamps, the new milling plant to cost \$340,000 and to be completed in eighteen months. The San Rafael vein has 1,000,000 tons of ore in sight. From the El Oro vein 200,000 tons of tallings have accumulated and a cyanide plant capable of treating 500 tons daily is to be erected to treat them. By summer there will be 600 stamps dropping in the camp. The Dos Estrellas mine is having an 80-stamp mill put up. The Esperanza has 120 stamps and 120 more are going in. The American M. Co. is building a second 100 stamps. The ores carry values in gold and silver.

OAXACA.

Reports from the Taviche M. & M. Co., in Taviche district, near Ocotlan, say that the mill is expected to be finished and in operation by May 15th. It is a concentration and amalgamation plant of 100 tons daily capacity, and the ores carry gold and silver.

SONORA.

The Dewey mine, near Willard Station, on the Sonora Railway, south of Hermosillo, has developed a body of graphite and is making regular shipments of that material, which is used as a lubricant. It is shipped to Bethlehem, Pa., where the company owning the mine has a factory.

Superintendent J. Reay of the Pavo Rico mine, near Douglas, Ariz., owned by the Atlas Exploration & M. Co., says he has men at work on the ground recently bought by the company, and several stringers of copper ore have been struck in the

shaft on the El Pavo Rico Grande, showing values in gold and silver.

The Douglas International says the Eva group of thirty pertenencias and another gold quartz group near Douglas have been sold to Detroit, Mich., men. The price for the latter group, which includes the Cinco Senores, Don Ramon, Dos Amigos and Adan, being 115 pertenencias, was \$110,000.

Plans are being prepared by G. B. Earnshaw for a 120-stamp gold mill and cyanide plant for the Cerro Prieto mines of the Nogales Copper Co. at Nogales, Ariz. The company has offices in Nogales and Chicago, Ill.

J. W. Rofelty, E. A. Armstrong, M. D. Hamilton, N. A. Walcott et al have formed a syndicate to operate in Sonora. They have bought a group of mines consisting of the San Carlos, San Ramon, Los Cuartos Tobaris gold properties and the La Fortuna and San Francisco silver properties. They are on the northern slope of San Carlos mountain, near Rio de San Carlos, and are reached by rail from Hermosillo, thence 100 miles by road to Baviacora. The Tobaris and Los Cuartos mines were formerly worked by the Spaniards, and there are a number of shafts and tunnels. There is a 10-foot ledge on the Tobaris. A stamp mill, a cyanide plant and other equipments will be installed.

NEW ZEALAND.

At the Waihi G. M. Co., Ltd., up to the present the working costs of the mine and mills have been on the highest scale. Development work had to be done on a large scale, and the erection of milling and mining plant necessitated a large outlay of capital. This might have been lessened considerably if the most competent persons had been employed to select and erect the machinery in the beginning. The introduction and abandonment of dry crushing caused the greater part of the milling plant to be converted from dry treatment to wet, which necessitated a large expenditure. Further expense in this department has for a time come to an end. The mine developments are well advanced, and in this respect the managers have expressed themselves that further depth is not required at present owing to the fact that the ore at the Nos. 6 and 7 levels are large. By the contract system a larger amount of work is being accomplished at a less cost. The miners' agitation has proved a gain to the employer and a loss to themselves.

The Tairua Broken Hills reports a discovery of another new lode, making four payable veins. The high-grade ore met with since the mine commenced operations under this company continues, and the output of bullion is large. With twenty stamps they have paid off liabilities, extensively developed the mine, and paid dividends amounting to 1s 9d per share. H. H. Adams is manager. The works are all carried out by contractors and the working costs are low.

TASMANIA.

The Mount Lyell M. Co. reports at Melbourne office, April 9: From March 5 to April 1, inclusive, a total of 21,565 tons of ore has been treated, the average assay value of the ore being: Copper, 2.19%; silver, 2.09 ounces per ton; gold, .072 ounce per ton. In addition to the above, there has been treated 3983 tons of purchased ore and metal-bearing fluxes. The converters have produced during the same period 416 tons of blister copper, containing: Copper, 410 tons; silver, 42,847 ounces; gold, 1586 ounces.

At Mount Zeehan silver-lead mines the March output was 370 tons of silver-lead ore, containing about 200 tons of lead and 37,000 ounces of silver.

PERSONAL.

W. TREADWELL, of Mayer, Ariz., is in Chicago, Ill.

J. CRONIN, of Spokane, Wash., is in San Francisco, Cal.

N. B. KNOX has returned to San Francisco, Cal., from Prescott, Ariz.

C. E. WATSON is manager of the Ordah-Tonopah M. Co. at Tonopah, Nev.

S. S. CLAWSON of Salt Lake City, Utah, is in New York on mining business.

E. J. DELANO, a mining man of Los Angeles, Cal., is in San Francisco, Cal.

MALCOLM MCLEISH, a mining man of Denver, Colo., is in San Francisco, Cal.

J. H. MACKENZIE of San Francisco, Cal., is examining mines in New Mexico.

E. L. GODBE of Salt Lake City, Utah, of the Eureka Hill M. Co. is at Pearl, Ida.

F. L. SIZER, manager of the Kimberley-Montana Co. of Montana, has returned to Helena, Mont., from San Francisco, Cal.

C. M. DULL returned to Salt Lake City, Utah, last week from a trip to South Africa.

O. F. RUBEL of Spokane, Wash., is examining mines near Downieville, Sierra Co., Cal.

C. G. FENNEL, manager of the Val Verde smelter, Val Verde, Ariz., is visiting New York.

S. O. SNYDER of the Idaho Dredging Co. has gone to Idaho from Salt Lake City, Utah.

G. W. MIDDLETON, manager of the Copper Cobre M. Co., Prescott, Ariz., is in New York.

P. A. JOHNS, manager of the Braganza G. M. Co., has returned to Prescott, Ariz., from Chicago.

O. J. SALISBURY of Salt Lake City, Utah, interested in Utah mines, is traveling in California.

T. J. NICHOLS, of Auburn, Placer county, Cal., is in San Francisco, Cal., on mining business.

F. JANNEY, superintendent of the De Lamar mill at De Lamar, Nev., is in Salt Lake City, Utah.

W. I. SMART, interested in mines at Placerville, El Dorado county, Cal., is in San Francisco, Cal.

J. R. ROBERTS returned last week to Parral, Mexico, from Kansas City, Mo., on mining business.

F. A. EARLS returned last week to Salt Lake City, Utah, from a trip to Montana, on mining business.

W. H. EDWARDS, of Salt Lake City, Utah, is examining mining interests at Muncey Creek, Nev.

A. E. SNOW is manager May Day M. Co., operating at Eureka, Utah, vice J. A. Hunt, resigned.

W. F. HALL of Douglass, Ariz., is in Phoenix. He is interested in mining property in Sonora, Mexico.

J. M. HAMILTON returned last week to Salt Lake City, Utah, from a trip to Nevada on mining business.

H. C. PLUMMER, of Placerville, El Dorado county, Cal., is in San Francisco, Cal., on mining business.

H. W. TURNER of San Francisco, Cal., is making mine examinations near Medford, in southern Oregon.

O. C. WRIGHT, president Blue Bird M. Co., is in New York from Sumpter, Or., on company business.

L. GINGER of Colorado Springs, Colo., is in Boston, Mass., after an examination of mines in Sonora, Mexico.

PRESIDENT GILL, of the Shannon C. M. Co., has returned East from a trip to their mines at Clifton, Ariz.

R. E. OBER, superintendent Beatrice mine, Murphys, Calaveras county, Cal., has returned from the East.

E. W. ILIFF of Chihuahua, Mexico, is manager of the San Salvador mine at Terrazas, Chihuahua, Mexico.

H. T. BENSON returned last week to Olinghouse, near Wadsworth, Nev., from an extended business trip East.

W. MORRIS, assayer Octave G. M. Co., Octave, Ariz., is in Lima, Ohio, called there by the death of his father.

T. L. DARBY of Denver, Colo., is at Bigbug, Yavapai county, Ariz., where he owns interests in the onyx fields.

H. L. PICKETT returned to Salt Lake City, Utah, from an examination of mining property in northern Arizona.

MANAGING DIRECTOR E. O. LEE, of the Dexter mine at Tuscarora, Nev., is at Tuscarora from Salt Lake City, Utah.

C. KOELLE is superintendent Compania Metalurgica Mexicana, at San Luis Potosi, Mexico, vice C. M. Van Cleve, resigned.

O. P. HOPKINS, manager Samson G. M. Co., near Prescott, Ariz., is in Colorado Springs, Colo., on mining business.

A. E. SNOW is managing director of the May Day M. Co. of Salt Lake City, Utah, operating at Eureka, Tintic district, Utah.

M. FRIDAY, of Salt Lake City, Utah, is at American Fork, Utah, to start work on the property of the American Fork M. Co.

W. J. LAWRENCE AND H. A. SMITH of Salt Lake City, Utah, are at the mines of the Lawrence Con. Co., in Elmore county, Idaho.

R. S. TOWNE of New York, president Compania Metalurgica Mexicana, is at the company's smelter at San Luis Potosi, Mexico.

F. T. HAMSHAW of New York is at Atlin, B. C., to superintend operations on the placer properties of the McKee Con. Placer Co.

H. KEHOE, E. M., has returned to Spokane, Wash., from an extended trip through Arizona, southern Nevada and California.

C. D. BERG of Lead City, S. D., is superintendent and manager of the Yellow Creek G. M. Co., operating at Dumont, S. D.

G. B. EARNSHAW is consulting engineer for the Nogales Copper Co., owning the Cerro Prieto mines near Magdalena, Sonora, Mexico.

SUPERINTENDENT F. SMITH, of the Wolverine and Mohawk copper mines, near Houghton, Mich., returned last week from Arizona.

R. H. ROBERTS of Hancock, Mich., is at Bisbee, Ariz., to take charge of the financial management of the Wolverine & Arizona C. Co.

MANAGER R. COX of Ouray, Colo., is to manage the Silver Lake mines, near Silverton, Colo., for the Guggenheim Co., vice S. I. Hallett.

J. P. ELKIN of Indiana, Pa., is president of the Terrenates Con. M. Co., operating at Parral, Chihuahua, Mexico, succeeding A. D. Meloy.

C. BROWN has resigned as superintendent of the Old Colony M. Co. in Tintic district, near Eureka, Utah, and has gone to Ogden, Utah.

L. H. OUTZEN of Salt Lake City, Utah, manager of the Annie Laurie Extension mine at Marysville, Utah, is in St. Louis, Mo., on company business.

H. CLEMENT is superintendent of the Eagle and Blue Bell mines at Eureka, Utah, with J. B. Creighton of the Tesora as assistant superintendent.

H. BLAUVELT, of Prescott, Ariz., superintendent of Cash, Monte Cristo and Catoclin M. Companies, is visiting New York and other Eastern cities.

GEORGE L. KAEDING, E. M., of San Francisco, Cal., has gone to El Dorado county, Cal., to examine mines near Placerville, for prospective purchasers.

B. M. SNYDER of Anaheim, Cal., is assayer and chemist at the B. C. Copper Co.'s smelter at Greenwood, B. C., vice G. Sundberg, who is at Sand Point, Ida.

MANAGER G. H. ROBINSON and J. W. Neill, chief metallurgist for the Tintic M. & Dev. Co. of Eureka, Utah, have returned to Salt Lake City, Utah, from the East.

J. E. ROBERTSON, JR., representing the W. S. Tyler Co., Cleveland, Ohio, the past three years in Mexico, will have charge of their branch office in El Paso, Texas.

H. PASCHAL of Chicago, Ill., a director of the Tri-Bullion S. & D. Co., owning the Starlight mines near San Carlos, Ariz., returned last week to Chicago from a trip to the mines.

A. S. DWIGHT has resigned as manager Compania Metalurgica Mexicana, at San Luis Potosi, Mexico, and is in New York, consulting as to the management of a property in Sonora, Mexico.

MANAGER S. I. HALLETT of the Silver Lake mines, owned by Guggenheim interests, near Silverton, Colo., may go to Mexico to assume charge of mining property for the same company.

P. JOHNSON has resigned as manager of the British Columbia C. Co.'s smelter at Greenwood, B. C., and has gone to Prince of Wales Island, Alaska, to build a smelter for an English company.

W. A. PRITCHARD, manager of dredging operations on the Gold Coast, West Africa, is in San Francisco, Cal., buying dredging machinery. He has been inspecting dredgers and mining operations at Oroville, Cal.

C. M. VAN CLEVE has resigned as superintendent Compania Metalurgica Mexicana, at San Luis Potosi, Mexico, and goes to Mapimi, Durango, Mexico, to assume a similar position with the Compania Minera de Penoles.

E. A. WILTSEE, E. M., of Denver, Colo., has been asked to sit as American representative of the Venture Corporation, Ltd., of London, Eng. Mr. Wiltsee's office will be at the company's headquarters in the Mills Bldg., New York City.

IVAN RAGAZ has resigned as superintendent of the Sierra Mojada and Santa Eulalia mines of the Guggenheim Exploration Co. in Chihuahua, Mexico, and after May 10 will be in charge of the operating department of the Stilwell mining interests, with headquarters at Chihuahua, Mexico.

Obituary.

S. P. SMITH, manager of the Carson Hill G. M. Co. at Irvine, Calaveras county, Cal., was accidentally killed April 20th while examining some heavy machinery at the Gold Hill mine, near Angels. Deceased was a native of Maine, aged 49 years.

S. MORGAN SMITH died in Los Angeles, Cal., April 12th. He was born Feb. 1, 1839, in Davie county, North Carolina. He attended the Moravian College at Bethlehem, Pa., from which institution he graduated in 1861. During his college course he prepared himself for the ministry and from 1861 to 1866 he was pastor of the Moravian Church at York, Pa. In 1864, he was elected Chaplain of the Two Hundredth Regiment, Pennsylvania Volunteers, in which capacity he served until the end of the war. In 1866, he went to Canal Dover, Ohio, where he had charge of a congregation for five years. Here he was forced to quit the ministerial work in 1871, on account of a serious throat affliction, and he returned to York. In 1875, he became interested in the manufacture of water wheels. His first wheel was known as the "Success," many of which were installed in mills and factories throughout the country. Later he placed upon the market the "Improved Success," a wheel giving more power than the "Success" of the same diameter. He found ready sale for a great many of these wheels in this and foreign countries and many hundreds are in use driving all kinds of machinery. In 1892, he engaged in the manufacture of the "McCormick" water wheel. Since he began the manufacture of the last-named wheel, he supplied many of the largest plants in operation in this country and Canada and shipped extensively to foreign countries. Although the shops were small in which he started the manufacture of water wheels, they had assumed such proportions that, at the time of his death, they were among the largest and best in the nation. He was president of the Atlanta Water & Electric Power Co., as well as president of the company which bears his name. As a minister of the Moravian church, he was a close student and an eloquent orator. In his demeanor, he was a man of warm disposition, kindly nature and charitable in every sense.

Commercial Paragraphs.

PAWLING & HARNISCHFEGGER, Milwaukee, Wis., have leased additional shops and are in shape to build their cranes and hoists in time to insure prompt delivery.

THE Ficher Lead Co. announce the removal of their Chicago office on May 1 to more convenient and commodious quarters in the Tacoma building, La Salle and Madison streets.

THE Risdon Iron Works of San Francisco, Cal., report general sale of the Evans hydraulic water lift, for use in all elevating mines, sending one this week to Bahia, Brazil. They are made in different sizes to suit local requirements.

J. E. ROBERTSON, JR., American representative of the W. S. Tyler Co., wire cloth manufacturers, Cleveland, Ohio, has moved his headquarters from Mexico City to El Paso, Texas, and will carry a stock of wire cloth at that point.

THE Brown Corliss Engine Co. of Corliss, Wis., have an order from the Saxony Worsted Mills, Newton, Mass., for one 16 & 26x42-inch cross compound Corliss engine, and an order from the Berlin Mills

Co., Gorham, N. H., for four 24x42-inch simple Corliss engines.

G. W. MYERS, representing the Chrome Steel Works of Brooklyn, N. Y., says the Italian-American Bank of San Francisco, Cal., will use the "welded, 5-ply, chrome steel and iron" for burglar-proof vault construction in their new building at Sacramento and Montgomery Sts.

THE C. O. Bartlett & Snow Co. of Cleveland, O., state that they have an order from the Schwartzkopf Coal Dust Firing Syndicate of Haydock, Eng., for one of their C No. 3 grill four-compartment dryers for drying coal. They also have orders for their dryer from Wood & Swart, Denver, Colo., and the Payne Con. M. Co., Sandon, B. C.

THE Buff & Buff Mfg. Co., formerly of Buff & Berger, manufacturers of surveying, engineering and astronomical instruments, No. 9 Province Court, Boston, Mass., announce the new and permanent location of their Boston city office at No. 9 Province Court, where a full line of their instruments and engineering supplies is in charge of G. G. Ledder. A special reception room is provided for use of visiting engineers.

THE Allis-Chalmers Co. of Chicago, Ill., state that "the volume of business on the books of the company to-day far exceeds that of any time since the organization of the company, notwithstanding the fact that the output of the plants has been increased to a large extent. We can see no abatement of prosperity in our various branches of manufacture. There seems to be an unlimited demand for all kinds of high-grade machinery, which is certainly a good indication that prosperity is enjoyed in all lines of manufacture."

Catalogues Received.

The 5th edition of Catalogue No. 17 of the Risdon Iron Works, San Francisco, Cal., gives the latest in construction, costs and results of the gold dredges they manufacture, with some facts and figures as to the profitable nature of that form of gold mining.

"Transit Points" is the title of a little treatise on the precise transit made by the Buff & Buff Manufacturing Co., 9 Province Court, Boston, Mass., the result of thirty years' experience with a critical clientele. The booklet will be mailed free to any address.

The catalogue from Crane Co., 25 First street, San Francisco, Cal., which they term their "Pocket Edition Catalogue" for 1902, is descriptive of valves, fittings, engine trimmings, tools, etc., and is of very convenient size for mining superintendents, at the same time being complete. They will be pleased to furnish it to any address on receipt of application for same.

"Traveling Electric Hoists" is the title of a neat and handsomely illustrated pamphlet issued by Pawling & Harnischfeger of Milwaukee, Wis., being Bulletin No. 13 of their series of interesting descriptive catalogues. These hoists can be applied in a variety of different ways: The serving machine tools, loading and unloading freight from cars, handling sheets, rods and castings, carrying lades for light casting, taking patterns to and from foundries, carrying coal to storage bins, disposing of cinders and ashes, transferring bales of cotton or other goods, handling plate glass, also in galvanizing and tinning processes. To these and many other uses the electric traveling crane can be applied. This interesting catalogue may be had upon application.

The firm of F. W. Braun Co., Los Angeles and San Francisco, have recently issued a new edition of their catalogue, "Modern Labor Saving Appliances for Assayers' and Chemists' Use," to take the place of the former edition which appeared about two years ago, and which is entirely exhausted. It is a handsomely gotten-up book, and shows in detail the line of specialties manufactured by this firm. All of their appliances are designed particularly for laboratory use, and the line embraces crushers, pulverizers, furnaces, burners, rolls, and a number of small articles that will be found convenient in metallurgical work. This firm has been established a number of years on the Pacific coast, and their specialties are in use throughout the world. During the past few months they purchased the business of John Taylor & Co., 63 First St., San Francisco, which they are continuing at 1820 Spear St., San Francisco, with increased stocks in conjunction with their Los Angeles house. Anyone interested in mining appliances can have a copy of this catalogue, which will be forwarded by Messrs. F. W. Braun Co., on request.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING APRIL 21, 1903

- 726,012.—NUT WRENCH—H. E. Andrew, Endicott, Wash.
725,651.—COMBINATION TOOL—G. L. Baker, Waterford, Cal.
725,920.—FOUNTAIN INKSTAND—J. A. Barry, Coronado, Cal.
725,922.—HOOK AND EYE—L. N. Bedford, Los Angeles, Cal.
725,821.—BED COVERING—A. W. R. Berr, Eureka, Cal.
726,149.—BURGLAR ALARM—R. M. Ducklin, Los Angeles, Cal.
725,691.—BICYCLE HANDLE—L. S. Fletcher, Anaheim, Cal.
725,835.—PLOW—N. A. Freeman, Tillamook, Or.
725,834.—AERIAL RAILWAY—L. A. Gross, S. F.
725,958.—BALING PRESS—C. E. Hardie, Chico, Cal.
725,841.—DRILL EXTRACTOR—C. A. Horan, Stockton, Cal.
725,848.—CONSTRUCTION FLOORS, ROOFS, ETC.—P. H. Jackson, S. F.
725,850.—TELEPHONE RECEIVER HOLDER—G. Konigstein, S. F.
725,973.—CAGE—A. Kuhlmann, S. F.
725,974.—BURNER—R. Livingston, Los Angeles, Cal.
725,862.—OIL VAPORIZER—J. McDermott, Berkeley, Cal.
725,854.—GOLD SAVING APPARATUS—W. B. McPherson, Los Angeles, Cal.
725,981.—AIR SHIP—T. Michelson, Los Angeles, Cal.
725,872.—BALING PRESS—J. T. Renas, Petaluma, Cal.
725,874.—PLUMBER'S CLAMP—C. Riley, S. F.
726,106.—OIL BURNER—C. W. Sievert, Los Angeles, Cal.
725,883.—GOPHER GUN—C. Sims, San Jose, Cal.
726,002.—INSCRIBER—R. H. Smith, Rialto, Cal.
725,783.—ASSEMBLING SPRINGS—J. A. Smithline, Los Angeles, Cal.
725,789.—POUCH—J. A. Smithline, Los Angeles, Cal.
726,113.—SPRING BED—J. H. Thomas, Clarke County, Wash.
726,119.—MUSIC SATCHEL—R. E. Trognitz, San Diego, Cal.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

FLOORS, ROOFS OR LIKE CONSTRUCTIONS.—No. 725,848. April 21, 1903. Peter H. Jackson, San Francisco, Cal. This invention consists especially in an improved method for rapidly laying and fixing the corrugated metal sheet bottoms which form the first portion of the structure; secondly, in a means for securing them in place and in laying the sheet bottoms at different levels, so that the thinner portions which hold the glass illuminating lights will form a continuous surface with the thicker plain portions which are a part of the structure. It also comprises a means for forming a continuous upper surface of richer and finer cement surrounding the glass and extending over the plain portion and the bottom of the deeper plain portion made of a different quality, and in so marking or lining the surface of the plain portion as to prevent cracks by reason of unequal expansion and contraction.

BALING PRESSES.—No. 725,872. April 21, 1903. J. T. Renas, Petaluma, Cal. This invention consists of certain novel features in baling presses of the vertical type, and particularly in the feed mechanism thereof, whereby the feed gate is automatically operated in relation to the movement of the plunger. It also consists of a brake by which the descent of the plunger is regulated, and a means of rendering the horse power portable, which latter is of great importance, as it is frequently necessary to move the press and power from one stack to another in the work of baling.

BED COVERINGS.—No. 725,821. April 21, 1903. A. W. R. Berr, Eureka, Cal. The object of this invention is to provide a quilt having increased sanitary properties over those ordinarily in use and also to furnish a quilt whose outer covering may be cleaned or replaced at any time without injuring the quilt, or in any way disturbing the padding.

TELEPHONE RECEIVER HOLDER.—No. 725,850. April 21, 1903. G. Konigstein, San Francisco, Cal., one-half assigned to Max Horwinski, Jr., and E. Horwinski of same place. This invention relates to a device for adjustably holding the telephone earpiece or receiver while it is in use and in suitable relation with the mouthpiece, so that the hands are relieved of the duty of holding the receiver and are left free to write or for other purposes.

FOUNTAIN INKSTAND.—No. 725,920. April 21, 1903. J. D. Barry, Coronado Beach, Cal. This invention relates to improvements in receptacles for containing ink in which the filling of the well is effected automatically. Its object is to provide an article unique and simple in construction, practical and easy of operation and artistic and ornamental in appearance.

OIL HEATER AND VAPORIZER.—No. 725,862. April 21, 1903. J. McDermott, West Berkeley, Cal. This invention relates to an apparatus for heating and vaporizing oil or petroleum products for ultimate use in an oil burner. The action of the apparatus is something as follows: The oil is supplied by one or more pumps, or by gravitation, and, passing through a pipe into the interior of the chamber, is first acted upon by the heat surrounding this chamber, and its temperature is gradually raised as the oil rises within the chamber until it reaches the point of exit into the surrounding pipes. Passing out through these pipes in reduced quantities, the steam acts to still further raise the temperature of the oil, on account of the small bodies which are subjected to the action of the steam, and when it reaches the exit it will have been sufficiently vaporized or heated.

GOPHER GUN.—No. 725,883. April 21, 1903. C. Sims, San Jose, Cal. This invention relates to improvements in that class of firearms known as "gopher guns" and designed to be set in the path of gophers and like burrowers and to be ex-

ploded by the movement of said animals. Its object is to provide a breech-loading gun of simple and economical construction in which blank cartridges may be used and in which the discharge of the gases will take place upwardly beneath the belly of the animal and insure his destruction.

BALING PRESS.—No. 725,958. April 21, 1903. C. E. Hardie, Chico, Cal. This invention relates to improvements in baling presses of the continuous type employing a plurality of followers operating successively by an endless carrier. It consists of a horizontal press box having a compression chamber at one end and a feed chamber at the other, a follower operable therein, means for operating the follower, a closure for said compression chamber, said feed chamber having a feed opening at the top, a closure for said opening, said closure comprising two oppositely disposed doors, cross bars secured to one of said doors, said cross bars having one end fitted to engage fixed vertical guides on the press frame and the other end extending across the top of the other door, and means including the hinged straps to lock said door.

AERIAL RAILWAY SYSTEM.—No. 725,838. April 21, 1903. L. A. Gross, San Francisco, Cal. This invention relates to improvements in overhead transportation systems employing a single rigid track and a movable cable to propel the car. Its objects are, first, to provide means by which it is possible for a passenger to continue a journey uninterrupted from time of taking car until destination is reached; second, to provide seats and afford exclusiveness for all passengers by means of improved chair-car system; third, to provide means for the occupant or occupants of any car stopping off at way stations without interfering with continuity of passage of succeeding cars.

Latest Market Reports.

SAN FRANCISCO, May 1, 1903.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 53½c, refined (1000 fine); San Francisco, 53½c; Mexican dollars, 42 @ 42½c San Francisco, 42c New York.

Silver shows a material increase in price over recent quotations, and it is anticipated it may reach 55 cents within a short time. The present price is about 6 cents over quotations of a few weeks ago, a substantial increase.

COPPER.—New York: Standard, \$14.75; Lake, 1 to 3 casks, \$14.50 @ \$14.75; Electrolytic, 1 to 3 casks, \$14.50 @ \$14.75; Casting, 1 to 3 casks, \$14.50 @ \$14.75; San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £60 15s spot per ton.

Copper shows a slight falling off in price, attributed to a dull market. It is believed that consumers are holding off orders, using all the stock on hand, in hope of lower price, but as many of them must soon stock up again an advance to 15 cents or more may be anticipated in May.

LEAD.—New York, \$4.37; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½ 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½; pig, \$1.75. London: £11 17s 6d per long ton—2.75c per lb.

SPELTER.—New York, \$5.75; St. Louis, \$4.60; London, £21 17s 6d per ton; San Francisco, ton lots, 6½; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 @ 15c.

TIN.—New York, pig, \$30.05 @ \$30.12; 200 lbs., 32½c; less, 33c; bar tin, 3½ lb, 35c @ 37½c. London, £137 5s spot.

PLATINUM.—San Francisco, crude, \$18.00 @ 30c; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$45.50 @ 46.00; large lots; London, £8 15s; San Francisco, local, \$45.00 @ \$46.00; 7½ lb.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 31c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17.15c.

NICKEL.—New York, 50 @ 60c @ lb.; ton lots, 45 @ 48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.35; gray forge, \$20.50; San Francisco, bar, 3c @ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.00; open hearth billets, \$31.50; San Francisco, bar, 7c to 12c per lb.

GENERAL SUPPLIES.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 72½ kgs., \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c @ set; 14 oz., 40s., 9½c.

CEMENT.—Germania, \$2.50 @ 2.75; Hewnmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50 @ 2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

OILS.—Linsed, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c; Kerosene—Pearl, per gal., 22½c; Astral, 22½c; Star, 22½c; Extra Star, 25½c; Eocene, 24c; Elaine, 27½c; Water White, in bulk, 16c; Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; 2c; 2c; Mineral Sperm, cs, 25½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22½c; Lard Oil, E. W. S., bbl., \$1.00; cs., \$1.05; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50 @ 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 50 @ 55c.

CHEMICALS.—Cyanide of potassium, 98½—99%, jobbing, 25 @ 26c @ lb.; carloads, 23 @ 24½c; in tins, 35c; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 2½ @ 2½c @ lb.; caustic soda, in drums, 3 @ 4c @ lb.; Cal. s. soda, bbls., \$1.25 @ 1.50 @ 100 lbs.; sks., \$1.05; chlorate of potash, 12 @ 13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; borax concentrated, 7 @ 8c @ lb.; roll sulphur, 4 @ 6c; powdered sulphur, 2 @ 3c; flour sulphur, French, 2 @ 3c; alum, \$2.00 @ 2.25; California refined, 2 @ 2½c; sulphide of iron, 9c @ lb.; copper sulphate, 5 @ 7c; chloride of lime, spot, \$2.50 @ 2.75; sulphuric acid, in carboys, 66½ B, 2½c @ lb.; nitric acid, in carboys, 8c @ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, 4c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 4c per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @ 9c per lb.

BONE ASH.—Extra No. 1, 5 @ 6c per lb. No. 1, 4 @ 5c.

BORAX.—Concentrated, 7 @ 9c per lb. powdered, 9 @ 12c; fused, 25 @ 30c.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Sulphate, 5 @ 7c.

MANGANESE.—Pure, 10 @ 11c.

MOLYBDENUM.—\$2 per lb.

CHROMIUM.—(90% and over) per lb., \$1.00.

SODIUM.—Metal, 10 @ 11c.

MERCURY.—Bichloride, 10 @ 11c.

PHOSPHORUS.—(American) 10 @ 11c.

SILVER.—Chloride, 10 @ 11c; nitrate, 55c.

URANIUM.—Oxide, 10 @ 11c.

ZINC.—Metallic, chemically pure, 10 @ 11c; dust, 10 @ 11c; sulphate, 10 @ 11c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

ANALYTICAL CHEMIST DESIRES POSITION as Assayer or as Chemist in charge of cyanide plant. Thorough knowledge of cyanide process and treatment of difficult ores a specialty. Highest references. Address "Cyanide," care Mining and Scientific Press, 330 Market St., San Francisco.

A COMPETENT PRACTICAL CYANIDE MAN, Assayer and Chemist, with thirteen years' experience, wishes position. Have built two of the largest plants in the U. S. Best of references furnished. Address "Jackson," care of this office.

COMPETENT MILLMAN, MACHINIST AND Chemist. Experience free mill and concentrating. College education. Have built and operated mills in Montana for 12 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. References the best. Address H., care this office.

CYANIDE CHEMIST OR MILL SUPT. TECHNICAL graduate. Specialty, construction; also, successful treatment of low grade ore and slimes. Good references. Address "Spanish," this office.

MINE FOREMAN WISHES A CHANGE OF position—foreman or superintendent. Age 37. Experience, 13 years. Can assay and survey. State locality and salary paid. No objection to South America or Mexico. Some knowledge of Spanish. Address M. O. I., this office.

MINING SUPERINTENDENT, FOURTEEN years' successful experience in management of mine, with best of references, desires situation. Address N. F., this office.

PHYSICIAN DESIRES POSITION WITH MINING company in California. Graduate of University of California. Excellent hospital experience. Please address L., this office.

POSITION BY PRACTICAL ELECTRICAL ENGINEER of nine years' experience, now in charge of 2000 H. P. of motors and 400 arc lamps. Can install any electrical apparatus. Address J. R. W., this paper.

WANTED.

Metallurgist and Smelter is open for engagement to take charge of copper property. Thoroughly experienced in mining and treating low grade ores. Position preferred in Latin America. As assayer and analyst, age 35, single, excellent references. Address "Cohre," care of Mining and Scientific Press.

FOR SALE.

Tonopah Claims for Sale.

I have several good prospects for sale, located in known mineral belt in Tonopah mining district. Groups suitable for incorporation. Claims \$100.00 to \$250.00 each. Correspondence solicited.

Address **WALTER OSBORN,**
BOX 309, TONOPAH, NEVADA

A RARE CHANCE

to buy a complete "Merrill" Mill, as good as new, at a great bargain. Quadruple discharge; three 1000-lb. Stamps, complete battery; two sets Screen Frames; Countershaft and Boxes; two Pulleys for same; one triple-compartment Ore Feeder; one set extra Shoes and Dies; all pipe connections; every part in first class order as mill has been used only six weeks; also 8 feet of Amalgamating Copper Plates. Price low—terms spot cash. Inquire of **VICTOR MINING CO.,** Walker, Arizona.

FOR SALE FOR CASH OR WILL BOND.

ONE FULL CLAIM with water right and millsite. Partially developed. Prospects well in free gold. Will stand full investigation. Will deal with principals only.

Address **J. M. QUINN, Big Oak Flat, Cal.**

MONEY LOANED MINES.

Developed or partly developed which have Ore in sight. First-class references. Established 1855.
E. N. BREITUNG & CO.,
Marquette, Mich.

Thirty years of lamp making enable us to offer a

MINER'S LAMP that gives perfect satisfaction. The Globe Lamp has a globe and our name stamped on it. We also make The Star Miners' and Drivers' Lamps. Write us for circulars and wholesale prices. Sample lamps mailed on receipt of 25c.
GEO. ANTON, P. O. Box 64, Monongahela, Pa.

WANTED.

WANTED—Some Party for Half Interest, to pay expenses of three practical miners, to prospect in Mexico. Best references given. Address Box 644, Phoenix, Arizona.

WANTED--MILL TAILINGS.

Gold, silver or lead, in New Mexico, Arizona or old Mexico. Will buy or lease. Give location, quantity and value. **A. E. VAN VELSAN,** Telluride, Colorado. Box 181.

Wanted---A Superintendent

For foundry, forge, machine and boiler shops employing 20 men. Should be posted on mining machinery, structural work and up-to-date methods. Permanent position in excellent location. State qualifications and experience fully and salary expected. Answered confidential. Address **Z. P. O. Box 153, Station C, Los Angeles, Cal.**

MINING STOCKS WANTED.

If you are a stockholder in any good gold mining company and want to sell your shares

WE CAN GET YOU CASH. Send for our price list of 500 stocks. It tells what we will buy and what we will sell.

CATLIN & POWELL, M 94, 35 WALL ST. NEW YORK.

ASSESSMENT NOTICES.

GOLDEN CHANNEL DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Butte Creek, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of April, 1903, an assessment (No. 3) of one and one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 27 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of May, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on **SATURDAY, the 20th day of June, 1903,** to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. B. PAUL, Secretary.

Office—27 Crocker Building, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of April, 1903, an assessment (No. 35) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of May, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on **MONDAY, the 15th day of June, 1903,** to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—415 Front street, San Francisco, California.

WILLIETTA MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Jacksonville, Tulare County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of April, 1903, an assessment (No. 6) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Rooms 233-234 Crocker Building, corner of Post and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of June, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on **THURSDAY, the 2d day of July, 1903,** to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. McALLISTER, Secretary

Office—Rooms 233-234 Crocker Building, corner of Post and Market streets, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of March, 1903, an assessment (No. 17) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of May, 1903, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on **SATURDAY, the 10th day of May, 1903,** to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

PLACER MINING DREDGES
EQUIPPED WITH
GRIT-PROOF BUCKET CHAIN.

Improved Tailings Stackers, Screens, Elevators and Conveyors for Gravel, Ore, Slag, Concentrates, Etc.

THE LINK-BELT MACHINERY CO.
CHICAGO, U. S. A.

Whole No. 2233.—VOLUME LXXXVI.
Number 19.

SAN FRANCISCO, CAL., SATURDAY, MAY 9, 1903.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

Noted Mines of Yavapai Co., Ariz.

The Iron Queen mine is owned by the George A. Treadwell M. Co., which also operates the Boggs and Hackberry mines. One of the accompanying illustrations is that of the Iron Queen at Mayer. The shaft is 300 feet deep, and there are 2000 feet of drifts on the ledge. The company intends starting up the old Boggs smelter, as well as their new hydro-carbon smelter. They are now laying a pipe line from Crystal Springs to the hydro-carbon smelter, a distance of 9 miles.

The property of the Penn Gold M. Co. is at Walker, about 20 miles easterly from Prescott. W. L. Bell is superintendent. The illustration shows shaft No. 2 of the company. This shaft is down 765 feet. At present they are unwatering the mine, having encountered a very large volume of water which compelled them to install larger pumps. They expect to be able to start operating the mine in a short time. They have 9500 feet of underground workings. Shaft No. 1 is down 554 feet. Both shafts are inclines. All power is generated at shaft No. 2. The plant is equipped with one 132 H. P. and one 100 H. P. boiler, 10x14 compressor and 12x14 hoist. They also have a sawmill in connection with the mine. They mill

125 to 130 tons per day when operating. The ore is pyrites, galena and blende, which is concentrated. This company has been operating about five years, and in the past has been a dividend payer. The property is located on Lynx creek at Walker, Yavapai county, and is known as the Mud Hole. The illustration shows the water rushing from the bottom of the chute as it was dumped from the skip. Down in the lower righthand corner of the picture can be

seen the power plant and entrance to the tunnel of the Poland M. Co. This tunnel is being driven through the hill to connect with the mill of the Poland Co. at Poland. J. W. Martin is superintendent of the Poland Co.

This portion of Arizona is a mineral region of much promise. The rocks are old crystalline schists with many dikes and large masses of igneous rocks. Veins are abundant, and some of them contain high-

grade ores. A few years ago the districts east and southeast of Prescott were idle, the greater part of the veins were undeveloped and many of them were not discovered. Attempts to work the ores had proved unsatisfactory.

The prosperity and active career of the region may be said to have commenced with the opening of the Little Jessie and McCabe mines at Chaparral, which attracted attention to this district.

Causes of Mine Failures.

There are many causes for failure in mining enterprises, the principal one being the lack of sufficient valuable mineral in the rock mined to meet the expenses of mining and reduction. Another cause is inexperienced management, that is, a management which is honestly conducted, but which lacks the necessary experience to take advantage of existing favorable conditions, thereby increasing the cost of production to an extent which results in failure. This may be in the mine, in transportation, in the mill or smelter, or it may be in the office. A man who knows no better than to buy heavy railroad picks for underground drift work, and who inquires, on looking over the mine cost sheet, "what are chuck tenders—the men who chuck the ore into the cars?" has no "business" managing a mine. Another cause for failure of a good mine may be found in misdirected management—dishonesty on the part of a manager who combines rascality and technical knowledge to defeat and rob his employer. The latter is too often in evidence. Many mine owners have no practical or technical knowledge of mining and may be easily imposed upon by an unscrupulous superintendent who well knows how to cover the evidence of his dishonest practices and does not hesitate to do it.

Many men who have made a success of commercial business seem not to understand that mining is not as simple as it seems, thinking that it requires neither scientific technical knowledge, nor years of experience to insure success. It is true that there are numerous instances where business men have successfully conducted mining enterprises who had no previous knowledge or experience in mining, but in almost every case the mine has been rich and would have paid with any sort of management, and therefore no particular credit is due to the success of the inexperienced management. There is an aphorism among miners: "Good mines make good miners," and this is true in most cases. Where a poor, low-grade mine is carefully handled at the lowest possible expense, by a careful and experienced man, and still fails to pay, the unfortunate "super" gets few thanks and small credit for his effort.

Miners Want Duty on Lead.

Mine owners of the Slocan and other lead producing districts of British Columbia are endeavoring to have a duty placed on lead imported into the Dominion of Canada, as they claim that the present low price of lead, based on the London quotations, is prohibitory, and the greater number of lead producers in that province are closed for this reason. In the United States lead is quoted at \$3.90@4.37½ per hundred pounds in various parts of the country. The London price is £12 per ton, or about \$2.55 per hundred. From this price is deducted transportation charges, commissions, etc., which leave the miner from \$1.60 to \$1.75 per hundred. In the effort to secure favorable legislation on the proposed tariff the Canadian Government is now being importuned to fix a bounty on lead produced in Canada. This meets with more favor, but the Government wishes this bounty to extend only to lead mined in Canadian mines and reduced in Canadian smelters. As the smelters are to receive the large part of the bonus, the miners are vigorously protesting against the smelter clause, unless the bounty be large enough to give them material aid.

AS in electricity, so in mining, our most recent progress has been more along the lines of improving existing systems and devising new applications than in replacing those systems by newer ones. The present direct current series arc lighting system is similar to that of fifteen years ago, though the constant current machine of 1903 has an enclosed arc. The chlorination treatment of 1892 was but little different except in detail from that of the present, except, of course, that the harrel system has replaced the vat, and liquid chlorine has in some cases taken the place of bleaching powder. The present low voltage incandescent lighting system is but an outgrowth of that devised by Edison, as the present cyanide practice differs from that of eight years ago only in the occasional use of zinc dust instead of zinc shavings, and the different application

of oxygen. The telephone and telegraph differ as little in general application as smelting and leaching of copper ores or stamp mill practice differ from the general principles in vogue a decade ago. The progress in mining, metallurgy and electrical work in the last ten years has been prodigious, but has been more in the perfection of economical detail than in any notable novelty of system.

Stage Winding.

The first mention of "stage winding" for mines worked to great depth, appeared in the issue of the MINING AND SCIENTIFIC PRESS of June 24, 1899. Since then this idea has been greatly enlarged upon by mechanical engineers, but has not yet been put into actual practice. There are many and important considerations in an installation of this character, not the least of which is the cost of plant, but the mechanical difficulties are extreme and it is these that are taxing to the limit the ingenuity of the leading engineers on the Rand in South Africa. Numerous valuable contributions to the literature of the subject have been made, but, although it seems the best solution for reaching a depth greatly exceeding 5000 feet vertical, none of the companies interested have as yet had the courage, apparently, to make a test of relay winding. It is not improbable, however, that some of the deep shafts now sinking, or some among those projected for the deeper levels on the Rand, may undertake the experiment. It is evident that while the engineers have confidence in their mathematical computations of strains, "moments of inertia" and other mechanical features, this confidence is shared in a somewhat less degree by the owners. There is no doubt, however, that the ingenuity of the engineering corps on the Rand will be able to overcome the difficulties which now seem so great. Other problems which seemed equally difficult of solution have been solved in the past, and it is likely that ere long stage winding to a depth of 8000 feet, if not deeper, will be an accomplished fact and considered an ordinary matter. The mines of the Rand and mines elsewhere are going to be worked as long as they will return a profit, no matter what the depth may be. Human ingenuity has surmounted great obstacles in engineering in the past, and it will continue to overcome them in the future.

INGENIOUS advertisements almost entirely devoid of fact continue to appear alluring investors to put money in mining stocks of various degrees of worthlessness; all this being the natural desire of unscrupulous men to get at the savings of the many in these prosperous times; surplus earnings of those who have money to invest, and who are likely to believe the most barefaced statement regarding possible profit in mining investments. There is a constant stream of inquiries as to the merit or lack of merit of mining enterprises widely advertised. St. Louis was long the seat and center of considerable meretricious scheming, but Chicago and Los Angeles seem of late to be favorite ground for some of the most flagrant departures from truth. The latest lead in wildcat mine flotation is to use the names of prominent men in connection therewith. Unthinking readers imbued with the natural desire to believe what they see in print will naturally form the idea that if the Governor or the Senator or the leading merchant who is announced as a director in the prospectus thinks enough of the property to be a director it must be a good scheme. Another bogus proceeding is to take a "mining engineer," to fortune and to fame unknown, announce him as the great, the eminent, the expert of experts, and publish his laudatory letter on the property as a "report." The success of these creatures in inducing investment from ignorant people creates a host of imitators and the whole despicable business discredits the mining industry. Occasionally the Government steps in and secures conviction of one of those bunco men, but the nefarious business goes on. Meanwhile it would seem that any publication pretending to be devoted to mining or any cognate industry should show sufficient interest in the welfare of its readers to exclude from its columns the lying and shameful advertisements of mines and mining stocks that too frequently appear in the advertising columns of publications whose editors certainly know better. There are things in this life besides money.

The American Negro for the Rand.

In view of the shortage of laborers in the mines of the Rand, in South Africa, and the difficulty experienced in securing native labor in Africa, it has been suggested that negroes be secured in the Southern United States to work in these mines. There are many districts in the South where there is a surplus of laborers, and the suggestion is one worthy of consideration; but while the necessary number of men may be secured, if substantial inducements are offered, it is doubtful if the "2 shillings per day and rations," as suggested, would prove sufficiently attractive to these people, but by doubling this sum and providing good and commodious quarters this scheme might be put into practice. There would be several advantages in the employment of the American negro, among which is the ability to speak the English language and an intelligence above that of the natives heretofore employed in the South African mines. A commission has gone to China from the Rand to look into labor conditions there and to investigate the feasibility of securing a sufficient number of Mongolians to supply the present demand, but while it is probable that the necessary laborers could be secured in China, the American negro would probably be superior as a workman, and though demanding a higher rate of wages, he would probably be worth it. Particularly is this the case where the negroes have already had mining experience, as in Tennessee, Alabama and Georgia.

CONCENTRATES.

BLAST FURNACE SLAG mixed while hot with coal tar when laid will form a dustless, mudless road, smooth and hard as stone.

QUICKSILVER is produced at two places under British dominion, Savonas, B. C., and Tellicherry, presidency of Madras, India.

BRICKS found in Chaldean ruins bear the stamp of the makers which indicate that they were made 3000 to 4000 years before the beginning of the Christian era.

CHROMIUM increases the hardness of iron, and perhaps also its tensile strength and elastic limit, but lessens its adaptability to welding. Manganese, like chromium, is a hardener of iron.

MARCASITE—white iron pyrites, cockscomb pyrites—is essentially the same chemical composition as pyrite (FeS_2), but crystallizes in different forms. It has a lower specific gravity, and the color when fresh is paler.

COAL GAS is explosive when mixed with air in the proportion of one volume of gas to sixteen of air. The best mixture to use in an engine is about ten to one of gas, this being but approximate because of different qualities of gas.

The rock specimen from Jackson, Or., appears to be gneissoid granite, but the specimen was too small to make determination positive. Quartz, feldspar and biotite mica are plainly discernible. The rock is unusually fine grained for a granitic rock.

LEAD melts at 608° to 618° F. and tin at 442° to 446° , but an alloy made of equal parts of these two metals melts at varying temperatures, ranging from 370° to 466° F. Bismuth melts at 504° to 507° F., but an alloy made of lead three parts, tin two parts and bismuth five parts melts at 199° F.

An ore deposit lying flat on the summit of a hill, with no other covering than that of superficial debris, is not recognized as a lode or vein; and although valuable in itself, and may be mined or quarried, the locator has no extralateral right—that is, he will be confined to his boundary lines.

The lowest percentage of copper in an ore that will pay is like the smallest amount of gold in ore that can be profitably mined and reduced. No arbitrary limit can be fixed. Each mine has conditions peculiar to itself, and upon these conditions depends, to a great extent, the cost of production.

The only hydraulic suction dredger in use on the Pacific coast, as far as known to "Concentrates," are those of the "Bowers patent" type. The greatest amount of gold produced by a single dredger in one month has not been stated. The dredgers used in gold mining are mostly of the bucket and not the suction type.

INSTANCES have been observed where a dike crosses a vein, intersecting the vein, that a pay shoot has formed in the vein along or near the dike, the latter having had, apparently, a concentrating effect on the mineral solutions. In some mines there are a succession of such dikes crossing the vein with the occurrence of ore shoots at each intersection.

A **GOOD CEMENT** for leather belting is made by working together ten parts of bisulphide of carbon, one part oil of turpentine with gutta percha, forming a thick paste. The leather where the cement is to go should be unrolled and roughed, and when the cement is put on the ends should be pressed together closely till the cement has well dried.

When compressed air is employed in driving a rock drill, it gives up energy in proportion to the work it does, and its temperature is reduced accordingly for this reason. The exhaust of a steam drill is icy cold, ice often forming around the outlet. Machines, pumps and engines using compressed air must be provided with large exhaust, or they will "freeze up."

The term "gneiss" does not denote a rock of some definite composition, but any crystalline rock which has a banded or streaky character is described as possessing a gneissic structure. Gneiss originally was a miners' term for any rock which contained the ore he was seeking. It is a name usually given to rocks of granitic type, but, as above stated, is more strictly a structural term and is applied to many kinds of rock.

The rock specimen from Yale, B. C., is metamorphic. It was probably originally a dark green, basic rock, like some diabase or diorite, which has been compressed and subjected to shearing process, with a further alteration to a calcareous-magnesian rock, in which there is a small percentage of iron sulphide. The sulphide may contain gold or silver, but does not have the appearance or as-

sociation of rich ores of this class. It is not unlikely that in the immediate vicinity from which this specimen came there may be found a further alteration of the rock represented by steatite (soapstone), and it is also possible that in some of the less altered portions of the mass, rock may be discovered which more nearly represents the original rock.

STEEL that has been overheated but not burned may be restored to its former structural condition by heating it to a red heat, not too hot, and keep it at this temperature for ten to twenty minutes, and then allow it to cool slowly. If it has not regained its former characteristic qualities, the process may be repeated, but steel once damaged by overheating or burning can never be fully restored to its normal condition by any known process.

PLATTNER'S test for metallic arsenides, mentioned in "Concentrates," is as follows: Place a fragment of the mineral in a small cup bored in charcoal, and alongside of it a bead of borax; fuse together with a blowpipe at point of blue flame. If cobalt is present, the bead becomes blue. Take fresh borax beads, and repeat operation till, if nickel is present, a brown bead is the result. Continuing, with fresh borax, a blue or red bead shows presence of copper.

APPLICATION for a patent on any mechanical device will be received by the United States Patent Office; but when the device has any feature in its construction for which it is claimed that it is self-actuated—that is, a device which, once set in motion, continues in motion without application of exterior force of any kind—such application must be accompanied by a perfect working model, or the application for patent will receive no consideration.

WHERE one of several co-owners in working on a quartz claim discovers a cross lead or vein the discoverer of such cross vein cannot claim the same as a separate property, but the discovery belongs jointly to all of those interested in the original location. The discoverer of the cross leads may, however, locate a claim adjoining, but outside the boundaries of the original claim, provided he finds the cross lead to extend beyond the side lines of the original claim.

The examination of the geology of a volcanic region for the purpose of determining the probability of the recurrence of volcanic activity is of little value, for there may exist no outward sign of approaching eruption, or earthquake. This has been demonstrated repeatedly in the case of volcanoes long silent and presumably extinct, which have suddenly burst into violent eruption. The instance of the recent eruption of Mt. Pelee, on the island of Martinique, in the West Indies, is a case in point.

The friction in a steam driven air compressor is about 10% of the total horse power required. In a belt driven compressor it is often 5% or less. It takes about 0.2 of 1 H. P. to compress 1 cubic foot of free air to a gauge pressure of 100 pounds, about 0.189 H. P. for 80 pounds, and about 0.159 H. P. for 60 pounds pressure. A compressor to deliver 125 cubic feet free air and compress it to 100 pounds pressure would require 25 H. P., for 80 pounds 23.6 H. P., for 60 pounds of pressure about 20 H. P.

When mine locations are made the locator must so stake his boundaries that they may be readily traced on the surface. This must be done by building monuments of rock, or by setting up a stake at each corner and end center line. A discovery stake must also be set up. Prospectors frequently place their location notice within a tin can or other receptacle, and place it in the location monument in such a manner that it may be secure, but still may be withdrawn and the notice read by those who may wish information.

In judging the color of heated steel, above an incipient red, much depends upon the eye of the observer, and, to a greater extent, it depends upon the degree of illumination under which the observation is made, as the light of an open door or window, or artificial light of any sort. Men who temper steel drills on both day and night shift must learn by experience the effect of the light in which they work. A low, dull red in daylight would look much brighter in the night, and a heated drill which at night showed a ruddy color might look dull blue in daylight.

The principal function of the air receiver as an attachment to an air-compressing plant is to equalize the pulsations of the compressor and lessen the consequent shock. It also serves to some extent as a reservoir, furnishing a supply after the compressor is stopped from any cause. Unless the receivers are large, no considerable benefit may be anticipated, however, for as soon as the compressor stops the air in the compressor if in use continues to flow outward through the pipe line, with constantly diminishing pressure until it has lowered beyond the point of efficiency.

OWING to the decrease in the density of the atmosphere with increase in elevation, an air compressor located at high altitude takes in less air at each revolution. In consequence of this the first part of each stroke of the piston is taken up in compressing the rare air to a

density equaling sea-level pressure of 14.7 pounds per square inch, and the volumetric capacity of the air cylinder is correspondingly diminished. The power required to run the compressor at high altitude is also less than that necessary at low altitude, due to decreased resistance. In view of these facts, compressors are built for high altitudes which have the size of steam and air cylinders proportioned to the existing conditions at the locality where the compressor is to work. Friction in engine and compressor and leakage losses are constant quantities, and do not vary with altitude.

PLACER GOLD, whether in grains of microscopic size or in nuggets worth many thousands of dollars, are all due to a common cause everywhere. Placer gold is derived directly from gold-bearing veins and deposits, which have been disintegrated either by weathering or ground off by ice. Once freed from its matrix, the gold is subjected to abrasion, and the farther it travels from its original position in the vein, the more likely it is to be smooth and have the sharp edges worn off. A particle, great or small, never increases in size by uniting with other pieces. The gold of placers is compact, and any tendency to build up a larger mass by combining with other pieces is not present in gold of that character. To make this possible gold must be pure and in a spongy condition, like dental gold, which is especially prepared for this purpose. It is not necessary, however, that a nugget of gold should travel a long distance to become rounded. It may lodge in some secure position on bedrock, and in flood time the passage of the debris in the stream over the mass of gold soon causes the sharp edges and angles to be worn away, producing a rounded surface.

NATURAL color in water is due to two causes—vegetable stain or suspended matter. When the latter is present in appreciable quantity, it causes turbidity and is not a real pigment. The true color or vegetable stain is greenish-yellow to reddish-brown, and it is due to decayed plant growth; the suspended matter is generally mineral, and often contains iron. The color acquired by water at the bottom of a deep pond is largely due to this cause. A method of stating the depth of color in water is by comparison with a mixture of platinum and cobalt, the color produced by one part of platinum to 1,000,000 parts of water being taken as a unit. The color of surface water depends on the character of the neighboring vegetation and on the time that the water remains in contact with it. Water near steep rocks, where there are few trees, will generally be below 20 units in color; steep wooded or cultivated slopes give 20 to 50 units; similar, but gentler slopes, from 5 to 100; and swampy areas 100 to 500, or even higher. Colored water is gradually bleached by sunlight, the action taking place chiefly within 1 foot of the surface. Most people object to drinking water of a brownish color. In a town water supply the color must be removed or its formation must be prevented. The latter is more economical. Filtering through sand will not remove the color from water, and even clay will take it out but partially. Generally the water must be altered chemically, as by mixture of sulphate of aluminum, which coagulates the coloring matter. The color may also be removed by oxidation, as with potassium permanganate, or by ozone. The question is largely one of aesthetics, as natural coloring matter in water is rarely harmful.

TO **SUCCESSFULLY** smelt fine ore, either raw or roasted, upon a commercial scale, is sometimes done by briquetting. It sometimes happens that the binding material is objectionable. Another method consists in utilizing the fusing quality of bituminous coal, during the process of coking. The combination of coal dust or culm with fine iron ore, and, if desired, the necessary flux, will produce in the coking oven a metallic sponge or coke ready for the blast furnace. Analysis shows carbon 42%, iron 37%, limestone 13%, ash 8%. Analysis of magnetic iron ore before coking: Magnetite 71.08%, silica 22%, phosphorus .03%, titanium 42%. The raw material must be finely crushed and thoroughly mixed before being charged into the coke oven. The gases generated from the coking process, carried on in a retort oven, are recovered and used for fuel in the operation, besides leaving a surplus of about 3000 cubic feet per ton of charge. The time required for coking is twenty-four hours, and for the reducing of the sponge to metal four hours, making a total of twenty-eight hours for the conversion of coal dust and ore into finished metal. It is, of course, apparent that in the production of the sponge, a reduction of the metallic oxides takes place in the coking process, and the metallic sponge is in condition for reduction in the furnaces. The addition of the flux to the sponge is only made if the reduction to metal is to be made in one operation; otherwise it is added in the blast furnace. The production of a metallic sponge containing, say, iron and carbon only, can take place in ovens of any size or make. For the reduction into metal, however, a vertical oven having a capacity of about ten tons should be employed. Such an oven consists of a firebrick shell surrounded by a heating flue wherein the waste gases pass from a combustion chamber under the oven. When the coking process is completed, and while the metallic sponge is in an incandescent state, a strong blast is forced through suitable tuyeres to the interior of the oven, the reduction takes place rapidly and the molten metal and slag are tapped in the usual manner; the oven is then recharged for the next operation.

The Sea Level Mine, Alaska.

Written for the MINING AND SCIENTIFIC PRESS by
W. H. WASHBURN.

The Sea Level mine, in southeastern Alaska, upon which a 30-stamp mill and full mining equipment were completed last year, has been in continuous operation for a year, and the management feels much encouraged by the results of the season's operations. The property is advantageously situated for cheap mining and treatment of ore. The main shaft is about 800 feet from the mill, which is situated on the beach, on a good harbor, which affords accommodation for the largest ocean-going vessels. The mine is located on Thorne Arm, near the extreme southern end of the southeastern panhandle of Alaska, on Revilla Gigedo island, one of the principal islands of the Alexandrian Archipelago. The nearest town of importance is Ketchikan, which is 24 miles distant by water, on the same island. Ketchikan is rapidly growing in population and commercial importance, it being the distributing center of the mining district which bears its name. It is a port of entry and contains public schools, churches, a newspaper and various other institutions which mark the progressive enterprise of the community and the advance of civilization, while merchants and business men carry

which were frequently encountered during those years, and from which large quantities of gold were taken, in the form of wire, leaf, or moss gold.

It is, however, upon the presence of gold-bearing pyrites in its two white quartz veins that the owners of the property will largely depend for their supply of pay ore. The mine is the property of the Sea Level Mining & Milling Co., with headquarters at Seattle, Wash. The mining and milling plant, consisting of a fully equipped 30-stamp mill, hoisting works, air compressor, with machine drills, a water-power pipe line, cable tramway, electric lighting plant and a rock breaker, were installed in the early part of last year.

E. C. Morse represents the Sea Level Mining & Milling Co. at the mine. The ore bodies consist of two parallel fissure veins, which cross a hornblende schist country rock nearly at right angles to its laminations. The two main veins are about 20 feet apart, each having a casing on either wall of the white quartz veins of quartz-porphry averaging about 2½ feet in thickness.

The veins are continuous on the Sea Level claim for over 1000 feet in length. The average width of

eter and the remaining 150 feet is 20 inches. The pipe line is joined by slip joints and wired lugs, and is equipped with three drain valves in the low places and with air valves at the high points. The head of water at the hoisting works is about 85 feet; the head at the mill is about 154 feet. At the shaft house the hoisting works are driven by a 6-foot Pelton wheel with a double nozzle, while the crusher is driven by a 5-foot wheel of the same make.

At the mill there are two 6-foot Pelton wheels, one of which drives the batteries and the other the air compressor. There are also two 24-inch Pelton water motors, one of which drives the electric lighting plant and the other the six Frue vanners. The hoisting gear consists of two drums, each 24 inches in diameter, which are connected or disconnected at will with the shaft of the driving pulley. The power is transmitted to the driving pulley, which is about 50 feet distant from the water wheel, by a crossbelt

on a prosperous and growing outfitting trade with the various mining camps, prospects and fisheries which are scattered over the islands and adjacent mainland for a distance of 70 miles in all directions. Both British and American steamers, bound coastwise, from north or south, come to the wharves and load or discharge their cargoes daily.

The Ketchikan mining district is comparatively new and but little development has thus far been done. It contains some good surface mineral showings and a great variety of ores are present. The various forms of free gold are found in the quartz ledges that lie in the limestones, schists and slates, which also carry gold-bearing sulphides of iron, with occasional streaks of gray copper ore, with high silver values. Chalcopryite ores are also present in large bodies on Prince of Wales and some of the adjacent islands.

The Sea Level mine was one of the earlier properties upon which prospecting operations and preliminary development were undertaken in the Ketchikan mining district. Gold-bearing veins were discovered in the early part of the year 1897 around the head of Thorne Arm. During the following season the Sea Level Mining & Milling Co. began prospecting operations preliminary to the development of the Sea Level and adjoining properties. Considerable attention was attracted to this region during the years 1898 and 1899 by the rich free-gold pockets

pay ore is about 3½ feet on each vein. The gold values are for the most part mechanically associated with pyrites in its various forms, either in the quartz or in the quartz-porphry along its contact.

The mining and milling plant is driven by water power. The water is taken from Gokatcheen creek above its falls, 295 feet above sea level. The water is diverted from the creek by a substantial crib dam, and conducted thence through a short stretch of ditch and flume to the penstock at the head of the pipe line, it being carried to the hoisting works and shaft house through 4400 feet of steel pipe. The diameter of the first 1600 feet of the pipe is 26 inches, the next 1600 feet is 24 inches and the remaining 1200 feet is 22 inches. It is over a rough, undulating country, causing several curves, both vertical and horizontal. Considerable trestle work was also required in its construction. The water is all discharged from the pipe at the hoisting works, that which is not required for driving the hoist and crusher being discharged through a waste pipe controlled by a valve. After the water has been used at the hoisting works, it is collected in a flume and penstock and carried for 850 feet in steel pipes to the mill, where it is used in driving the six batteries of five stamps, a 6-drill Leyner air compressor, six Frue vanners and the electric lighting plant.

The first 700 feet of this pipe is 22 inches in diam-

16 inches in width. In addition to the usual equipment of friction brakes on the hoisting drums, the deflecting hoods over the nozzles are under the convenient control of the engineer, so that the skip or bucket may be lowered at any desired speed with safety by simply deflecting the nozzle sufficiently to permit the water wheel to run backward against a part of the jet of water from the nozzle.

The shaft is of three compartments, each of them 4 feet 8 inches by 5 feet. Two compartments are equipped with guides, the middle compartment being used as a skipway and the southern compartment as a bucketway.

In the northern compartment is the pump, manway and air pipes.

At the bottom of the shaft is a small duplex Snow pump, which keeps the sump clear of water, pumping at the rate of about twenty gallons per minute. The ore is dumped from the skip on grizzlies over the ore bin, which has a capacity of 200 tons. That passing over the grizzlies falls on a steel-covered floor, from which it is put through an Austin No. 3 gyratory crusher placed over the bin. Some of the waste rock is here sorted out of the ore and run out on the waste dump. The rock crusher is driven by Manila rope transmission from the water wheel, which is about 90 feet distant from the counter shaft which drives the crusher. This counter shaft also drives,

or, rather, controls the tramway by a belt to its head gear. The tramway is 689 feet long, 428 feet of which has a 12½% and 261 feet a 23% grade, beside a lateral curve around which the cable is guided by sheave wheels. The cable is of steel wire, 4-inch diameter, endless running over two three-grooved sheave wheels at the head gear and over two single-grooved sheave wheels on a tension-weight box at the lower end. The cars are attached to the cable by means of a specially designed grip, which holds them securely and releases them automatically at the foot of the track. The motion of the cable being controlled by water power, as before stated, the cars are lowered with a much more regular speed than would be possible if gravity alone were used. A brake and clutch at the head gear give the operator perfect control of it. The cable runs one way, only stopping as the light car arrives at the top, a loaded car having gone down at the same time. An iron tailpiece drags behind the light car as it comes up the track, in case a grip should get loose; but this has not happened as yet.

The shaft is about 110 feet deep. At a depth of 50 feet there is a prospecting level, which was driven during the period when the earlier developments were in progress. At a depth of 110 feet there is over 1000 feet of drifts and crosscuts on the two veins, each of which have cartracks of 12-pound T-rails, over which Truax underground ore cars are operated. Ore is being drawn from a number of stopes, and though there is much ground that remains yet to be stope out on this level, the owners

tion to be well adapted to the successful treatment of the ores from the Sea Level mine. The tailings from the mill rarely exceed 25 cents per ton. Results from the Sea Level mine have been watched with great interest, because of it being one of the most extensively developed properties and the first upon which the erection of a well equipped plant of modern mining and milling machinery was undertaken in the Ketchikan mining district.

Rock Drills.

In making up power drills, it is the general custom throughout this western section to weld the fluted steel for hits to octagon shanks, says a writer in Sparks from the Anvil. There are but few places where the entire length of the drill is made of the fluted bar. The reason for this is that in the western country the rock is very much broken up as a general thing, throughout the mountains, and a great many seams and crevices are encountered which cause the drills, at times, to run sidewise and make it almost impossible to drill a straight hole. Where the hole becomes crooked the fluted steel binds, the flutes catching in rotating the drill, which causes trouble, while on the other hand an octagon or round shank can be made to turn, though it should bind in places.

In hardening the bits of power drills, I do not advocate drawing tempers, for the reason that there is always more metal in the center than in the wings, and where the temper is drawn in the ordinary way

dressing these drills for use in hard rock, I advise leaving the corners perfectly square across the edge of the rib, and that they be hardened back at least 1 inch from the edge, the hardening to be done at the lowest heat at which they will harden to the right degree.

In the lake region, when I visited that section, they seemed to have the hardening of this class of drills down to about as perfect a system as anywhere, particularly at the Republic iron mine, where the rock was excessively hard. Mr. Miller, who had charge of this class of work at that mine, never allowed the same person that dressed the drills to have anything to do with hardening them, but they were passed to a man whose duty it was to do that part of the work, this man being provided with a reheating furnace arranged similarly to a hot-heading furnace, in which the drills could be given a short heat and just as desired.

Nevada Eight Hour Law.

The eight hour law passed by the last Legislature of Nevada went into effect on April 25. The full text of the Act is as follows:

Section 1. The period of employment of workingmen in all underground mines or workings shall be eight hours per day, except in cases of emergency, where life or property is in imminent danger.

Section 2. The period of employment of workingmen in smelters and all other institutions for the reduction or refining of ores or metals shall be eight hours per day, except in cases of emergency, where life or property is in imminent danger.

Section 3. Any person who violates either of the preceding sections of this Act, or any corporation, employer or his or its agent who hires, contracts with, or causes any person to work in an underground mine or other underground workings, or in a smelter or any other institution or place for the reduction or refining of ores or metals, for a period of time longer than eight hours during one day, unless life or property shall be in imminent danger, shall be guilty of a misdemeanor, and upon conviction shall be punished by a fine of not less than one hundred (100) dollars, nor more than five hundred (500) dollars, or imprisonment in the county jail not more than six months, or by both fine and imprisonment.

Section 4. This Act shall take effect sixty days from and after its passage.

Hoisting Ropes.

Owing to the difference in ropes and the conditions under which they work there has been much confusion about the initial factor of safety.

The point where hoisting ropes most frequently give out is at the point of connection to the skip, where the factor of safety is much higher than where connected to the drums. For a 2000 feet rope of uniform section, for example, with a factor of safety of 7 at the drum, it would be 9½ at the skip. For a much greater depth, where taper ropes would be needed, such a ratio of factors at the top and bottom should suffice. It is evident from the foregoing that for 2000 feet a taper rope would not be advisable; and this might apply to still greater depths of, say, perhaps even 3000 feet. Corrosion is generally more active with ropes in inclines, since they are more liable to pick up moisture from the ground and drippings from the roof.

The factor of safety in a hoisting rope can evidently be taken lower for a rope which is not allowed to run for a long time than for one in which a long life is required. It would probably not be advisable to make a definite time limit for the use of ropes, not only because ropes operate under such different conditions, but also in view of the improvements which are constantly being made in the manufacture of materials for ropes, as to their wearing qualities and the devices that may be discovered for preventing corrosion.

The Helena Quadrangle, Mont.

A new and revised edition of the map of the Helena quadrangle, Montana, has been prepared by the United States Geological Survey. This map shows the results of the latest surveys in the most important mineral region of Montana.

Since the map was first prepared, fifteen years ago, the region has increased so much in importance that new surveys on larger scales have become necessary. This demand resulted in the making of the Butte Special map on a scale of about 1200 feet to 1 inch, which has been published, together with descriptive text and geological sections, as the Butte Special Folio, No. 38. Later the Boulder sheet, which represents the southeast quarter of the Helena quadrangle, was issued on a scale of about 2 miles to 1 inch. Next followed special maps about Helena and Marysville on larger scales.

These new maps have been reduced to a uniform scale and used as corrections to the old Helena map. The changes between the old and the new maps due to increase in population are particularly noticeable, and show in a graphic manner the growth of the country.

The Batteries, Sea Level Mill, Alaska.

of the property are contemplating sinking a shaft to an additional depth of 300 feet. The mine is equipped with four No. 3 and one No. 2 Leyner rock drills and one Ingersoll-Sergeant 3-inch drill. The air is furnished by a 6-drill Leyner compressor, driven by a belt connection with a 6-foot Pelton water wheel, which is located at the mill.

Truax ore cars carry the ore, loaded from the chutes in the ore bin at the shaft house, over the tramway to the mill, the latter having a capacity of 300 tons.

From the bin at the mill the ore passes through six Challenge ore feeders to six self-contained iron-frame batteries of five stamps of 1000 pounds each. The mortars are iron, with hack coppers and chucks.

Forty-mesh angle-slot screens are used, and the pulp which issues passes over silver-plated copper plates and the Frue vanners.

The ore from the Sea Level mine has proven amenable to treatment by amalgamation; though the values are largely associated with sulphides, more than 70% of the gold is recovered from the ore by amalgamation alone.

The tailings from the plates pass over six Frue vanners, which are situated on a floor below the battery floor, where the sulphides are concentrated and the tailings washed into the bay.

Light is furnished for the entire mining and milling plant, office, boarding house and other buildings by an electric lighting plant with a capacity of 100 16 C. P. incandescent lamps. There is a postoffice at Sea Level, and a regular mail is brought once each week from Ketchikan.

The transportation requirements of the Sea Level mining and milling operations are served by a gasoline launch of fifteen tons. The operation of the plant has been successful and given little trouble, it having proved by nearly a year's continuous opera-

the center will run out long before any colors show on the corners of the wings—a condition which causes a heavy strain by contraction and expansion, making the corners liable to crack; besides, the center, in hard rock, is liable to chatter.

The best method, to my notion, for hardening these drills, is to forge them and let them cool, then heat them short and plunge, keeping them in the bath long enough to thoroughly harden the bit, then withdraw them from the water and stand them on the damp ground. This holds the edge hard, and at the same time allows the heated portion back of the hit to cool gently, thus toughening and strengthening it.

The trouble I have found in hardening direct from the anvil at the same heat as the dressing heat, is that in most cases the steel is heated too hot, for while the outside may appear to be at about the right heat for hardening, the center is much too hot, and when plunged the bit is liable to burst in the corners of the wings.

Another reason why I advocate plunging this class of drills and giving them full hardness, instead of drawing the temper, is, that machine drills churn backward and forward in the hole, which subjects them to constant wear, so that, if not very hard, they soon lose their gauge. We have found in the excessively hard rock of British Columbia that even before the edges are dull the drills become too dull from this grinding action.

I may say in this connection, that while it appears more mechanical to round the corners of the wings, at the point, to the curvature of the circle that the bit would make, we have found that they hold their gauge much longer and work fully as free if the outer edge of the point is made square. The hard, square corners, it can readily be seen, will grind for a considerable time before wearing down so as to affect the actual size of the bit.

In all cases now where I give any directions for

Centrifugal Pumps for High Lifts.

Hydraulic engineers and miners have been slow to recognize centrifugal pumps as a medium for delivering water at a height of over 40 feet. Direct-acting steam pumps and geared, plunger pumps, up to within the last year or so, were the only known devices for raising water to elevations from 100 to 1000

maintenance to a minimum. The Byron Jackson Machine Works, 411 Market street, San Francisco, Cal., have designed and patented a centrifugal pump for raising any quantity of water to heads of 1000 feet or more.

Figure 1 is a cut made from a photograph of a series two-step centrifugal pump specially designed for the city water works of Fort Worth, Texas, and consists of two units of 5,000,000 gallons capacity

in the bottom of the shaft 80 feet below the surface. Each pump is driven by a rope transmission system from the engine at the top. An official test of this plant showed that a single engine with its pump raised 6,500,000 gallons in twenty-four hours to an elevation of 106 feet, the pump giving an efficiency of 80%. The cost of repairs on this plant is shown in a letter dated April 2, 1901, from the City Council of Rockford, signed by E. W. Brown, Mayor, saying: "The vertical engines and centrifugal pumps have been in constant use since August, 1898, and have not as yet cost this department a single dollar in repairs."

Canadian Geology.

Written for the MINING AND SCIENTIFIC PRESS by H. F. EVANS.

Briefly, Dominion geology may be divided into five districts, or rather regions, viz: Acadian, which comprises the maritime provinces Nova Scotia, New Brunswick and Prince Edward Island, to which may be added Newfoundland; the Laurentian lowlands, which extend from Anticosti west to the city of Quebec, and Lake Huron, including the Huron-Erie peninsula of Ontario, southeast of Ontario, the Ottawa Paleozoic basin, and the flat-lying Paleozoic sediments of the Province of Quebec; the Laurentian highlands, including the great peninsula of Labrador, to the east of Hudson bay and the country to the west and northwest of the same bay; the interior continental plain which runs north from the 49th parallel towards the Arctic ocean and embraces Manitoba, and what are known as the Northwest territories, including the districts of Athabasca, Mackenzie and the great undefined north, and the Cordilleran, or British Columbia region, which extends across the Rocky mountain system of Canada from the foothills to the Pacific ocean, including the great Cordilleran belt from the 49th parallel to Alaska.

The Dominion Geological Survey has a classification of its own. It is something like the following:

Quaternary.	Silurian.
Tertiary.	Ordovician.
Cretaceous.	Cambrian.
Jurassic.	Huronian.
Triassic.	Laurentian.
Permian.	
Carboniferous.	
Devonian.	

Of the 3,616,980 square miles of territory in British North America nearly two-thirds belong to the Archæan. The term is understood to embrace both the rocks of the Laurentian and those of the Huronian systems. The Laurentian constitutes the fundamental or older series in the Archæan.

The greatest activity reached by the Dominion Geological Survey in the Cordilleran region was during the preliminary survey of the Canadian Pacific Railway, its actual construction, and for several years afterwards. The death of Dr. Dawson, chief of the Geological Survey, appears to have checked, to a considerable extent, the energy and enterprise of that department. The Canadian Government has not yet appointed a successor to Dr. Dawson. At present there is only an acting chief—Dr. Robert Bell, who fills that position, was for a number of years a member of the Dominion Geological Survey.

A more down to date system has been advocated by the Progressive party in the Dominion and many radical changes have been suggested. It has even been urged to adopt the American system of classification and nomenclature, but this does not find favor with the old school, especially the old school geologist, who, in the Dominion, is not only strong in numbers, but in his political pull.

It seems to be a disputed point among Canadian geologists, whether or not the Carboniferous is represented. According to Dawson it is "largely represented," but members of his staff who have made examinations from time to time maintain that there are only altered representatives of this formation. As

there is no geological society in British Columbia, and as the Dominion is a large country, and the Geological Survey Corps comparatively small and the appropriation inadequate, it will probably remain for American geologists and mining men to determine the disputed problem.

It is officially stated with regard to the Cordilleran region that, in the Kamloops district of British Columbia and in the West Kootenay, Dr. Dawson recognized a Cambrian horizon in dark argillites 15,000 feet in thickness, which are superimposed on 25,000 feet of volcanic rocks described as the Adams Lake Series.

In the Rocky mountains members of the Geological Survey have described Lower, Upper and Middle Cambrian sedimentaries. In the Castle mountain group in the Bow River Series and near Donald limestone

Fig. 1.—Horizontal Series Two-Step Centrifugal Pump, Direct Connected to Electric Motor.

feet. On account of the heavy expenditures for repairs of direct-acting pumps owing to excessive wear on piston and valves caused by muddy or gritty water, there has been a long-felt need by

each per day. The shaft is 170 feet in depth; from the bottom of this shaft tunnels radiate to several wells from which the pumps receive their supply and the water elevated to a reservoir on the surface at a total lift of 200 feet. Figure 2 represents a vertical series three-step centrifugal pump for the city water works of New Albany, Ind., and consists of duplicate pumps, each of 2,000,000 gallons capacity per day and each driven by a 200 H. P. induction motor, direct connected by means of a vertical shaft extended to the surface. The pumps are set up in a cylindrical pit 14 feet in diameter and 30 feet deep. The balancing device is designed to carry the weight of the shafting, together with the rotor of a 200 H. P. motor. The pumps are expected to raise water from the several bored wells and force it through the mains into a reservoir against a total head of 310 feet. Centrifugal pumps for placer mining have been introduced and have proven to be the means of opening up many placer mines that otherwise could not have been worked, there being no other means at hand by which the gravel could have been removed and at the same time obtain sufficient

Fig. 2.—Vertical Series Three-Step Centrifugal Pump; 1500 Gallons Per Minute; 310 Foot Head.

engineers for an economical pump that could be adapted for any quantity of water at heads ranging from 100 to 1000 feet and over, for city water works, draining mines, creating pressure for hydraulicking, etc., and reduce the expenditures for

Fig. 3.—Horizontal Series Three-Step Centrifugal Pump; 1000 Gallons Per Minute; 520 Foot Head.

water for sluicing. Figure 3 illustrates this style of pump and is designed to raise 1000 gallons per minute to an elevation of 400 feet through a giant having a 2-inch nozzle, creating a hydraulic pressure at the nozzle of fifty pounds, making a total working head on the pump of 520 feet. Official tests show 80% to 84% on these centrifugal pumps, which the manufacturers say are taking the place of direct acting pumps for city water works—the first cost being less, producing a higher efficiency, and cost of repairs reduced to a very small item.

In 1893 the city of Rockford, Ill., installed for the city water works a complete plant consisting of three special designed centrifugal pumps and three Jackson vertical compound condensing engines with cylinders 9x15 inches and 15x15 inches running at 210 revolutions per minute. The pumps were placed

slates and sandstones contain fossils which have determined a Lower Cambrian, a Middle Cambrian and an Upper Cambrian. In the Yale district, where I have spent some time examining the formation, schists, sandstones, argillites and limestones constitute the Cambrian of the southern interior. The Cambrian strata of Mount Stephen, along the line of the Canadian Pacific Railway, are exceedingly fossiliferous and are rich in Neo-Cambrian trilobites, these are found abundantly at an elevation of 11,000 feet.

Compressed Air.

Reference has been made to the use of compressed air and its facility of adaptation to various requirements; but it is evident, from an inspection of some of the devices in use, that enthusiasm for new methods, rather than good judgment, has prevailed in many of its applications. For some years compressed air was used only in mines, where it produced marked economies. Later, it was introduced into manufacturing lines, and to-day its use in railway and other machine shops, boiler shops, foundries and bridge works is being widely extended, says Prof. Flather in Cassier's Magazine.

The air is used to operate riveting machines, punches, staybolt breakers, rotary tapping and drilling machines, fine rollers, rotary grinders, rotary saws, pneumatic hammers, chisels and caulking tools, flue welders, boring and valve-facing machines, rail saws, machines for revolving driving wheels for setting valves, pneumatic painting and white-washing machines, dusters for car seats, and the operation of switching engines about the yard. It is also used in the foundry for pressing and ramming moulds and for cleaning castings by the sand blast; but its greatest field of usefulness is its application to hoisting and lifting operations in and about the works.

New applications of compressed air are constantly being made, and each use suggests another. This has a tendency to increase the number of applications which are intended to be labor-saving devices, but in many cases the work could be done just as well and much more cheaply by hand.

A case in point is seen in an apparatus which was at one time in use on one of the more prominent railways. It was a sort of portable crane hoist which could be fastened to the smokestack of a locomotive whereby one man could lift off the steam chest casings. The hoisting apparatus weighed about twice as much as the steam chest and took three men to put it up. When piece work was adopted two men easily lifted off the steam chest, and this "time and labor saving device" was relegated to the scrap heap.

While compressed air has been used, to some extent, for inducing draught in forge fires, it is unquestionably a very expensive agent for such work. Tests have shown that it costs twenty-five times as much to produce blast in that way than it would with a fan.

The success and economy which have attended the use of compressed air in so many lines of work have led to its adoption in fields which are much better covered by electrically operated machines. While compressed air has been used very satisfactorily under certain conditions to operate pumps and engines, printing presses, individual motors for lathes, planers, slotters, dynamos and other work, it does not follow that it is always an economical agent for these various uses, or that other methods could not be used even more satisfactorily in a majority of cases.

It has been proposed to use individual air motors in machine shops and do away with all line shafting except possibly for some of the heavier machinery. This use of compressed air seems entirely outside the pale of its legitimate field. General experience thus far indicates that rotary air motors are not at all economical, and generally are not as satisfactory as electric motors. Exceptions are to be found in the small portable motors for drilling and similar operations to which electricity is not well adapted. The saving obtained by the use of such portable air drills, as compared with a hand ratchet drill, is very marked.

Although these tools are very successful, they are still rotary motors, not exempt from some of the objectionable features which seem to be inseparable from them. It is not surprising, therefore, to find a tendency to employ reciprocating pistons and cranks in these portable machines, and there are such tools weighing only forty pounds, capable of drilling up to 2½ inches diameter.

In most cases no attempt has been made to use the air efficiently; its great convenience and the economy produced by its displacement of hand labor have until recently been accepted as sufficient, and greater economies have not been sought.

In the matter of compression we still occasionally find very inefficient pumps in use, but manufacturers generally have learned that it pays to use high-grade, economical compressors. The greatest loss is that in the air motor itself. In a large number of cases it is impracticable, or, at most, inconvenient to employ reheaters, and we find very generally that

the air is used at normal temperatures for the varied purposes to which it is applied.

To obtain the most satisfactory results, the air must be used expansively; but usually where the demand for power is intermittent, no attempt has been made to reheat the air, and as a result the combined efficiency of compressor and motor is quite low, varying in general from 20% to 50%. While low working pressures are more efficient than high, the use of such pressures would demand larger and heavier motors and other apparatus which is undesirable. The advantages of higher pressures in reducing cost of transmission are also well recognized, and the present tendency is to use air at 100 to 150 pounds instead of sixty or seventy pounds of a few years ago.

By reheating the air to a temperature of about 300° F., which may often be accomplished at small expense, the efficiency is greatly increased; in some cases the increase has been found to be as high as 80%. While the lower pressures are yet more efficient, the loss due to higher compression is not serious.

If air be used without expansion, there is a material loss in efficiency; but, on the other hand, if it be used expansively without reheating, trouble may be experienced from drop in temperature below the freezing point. With moisture present, this drop will cause the formation of ice, which may clog the passages if proper precautions are not taken to prevent it. The low temperature will not in itself cause trouble; if, therefore, the moisture which the compressed air holds in suspension be allowed to settle in a receiving tank, placed near the motor or other air apparatus, and frequently drained, trouble from this cause will be largely avoided.

While it may be impracticable to reheat the air in certain cases, yet there are many situations where a study of means to overcome the losses referred to would result in marked economies.

The greater adaptability of compressed air to various purposes causes its use to increase along with that of the electric motor, for it has a different field of usefulness, independent of power transmission; at the same time, when the requirements are properly observed in its production and use, its economy as a motive power in special cases compares favorably with that of other systems. With a better knowledge of the principles involved, we may expect much better results than have yet been attained.

Adaptability of the Canda Cam.

It is a mistake to think that the Canda self-locking cam can only be used in connection with a specially sized and shaped cam shaft. The change can be made from any of the old style keyed cams to the Canda without the necessity of buying a new shaft. These cams are made with bores of a number of different diameters, so that, whatever the size of the shaft, it can be fitted. The holes for the studs can be drilled with an ordinary ratchet drill, the positions for the studs being determined by a templet, which the manufacturer will furnish, it being necessary only to state the order of drop, diameter of shaft, and whether for five or ten stamps or a single shaft. The accompanying cut shows the device by which the cam is made

Canda Cam.

self-locking, being a gib which fits inside the cam, and is simply a wedge onto which the cam is forced by the weight of the stamp and tappet as they are raised. The tightening action is continuous as long as the stamps are in operation. The thin end of the wedge is pointed toward the point of the cam arms, and the gib being held in position on the shaft by the studs, which fit in the keyway in the under side of the gib. To loosen the cam, a few blows on the reverse side of the arm will force it back readily. For this a heavy hammer is better than a light one, as a light hammer tends to crystallize any steel. Being made of chrome steel, the manufacturers say they are practically unbreakable by this treatment; however, a block of wood placed on the cam when being hammered lessens the liability of damage occurring. These cams are cheap, costing but little more than

the keyed cams, and are manufactured by the Chrome Steel Works, Brooklyn, N. Y., G. W. Myers, Haywards Bldg., San Francisco, Cal., being Pacific coast agent. Along the Mother Lode district of California there are over 400 Canda self-locking arms, both in use and being put in.

Tin in North and South Carolina.

Written for the MINING AND SCIENTIFIC PRESS.

The existence of cassiterite in the region of King's mountain, North Carolina, has been known for twenty years.

Crystals of cassiterite, many of them an inch in length, have been picked up in the clay soil in the neighborhood of King's mountain and even on the streets of the village of King's Mountain, particularly after heavy rains. This led about ten years ago to active prospecting for tin veins. It was found without difficulty in many small pegmatite dikes quite common in the granite area of this region. Finally efforts were made by competent mining engineers to obtain the tin on a commercial scale. For this purpose a 10-stamp mill was erected, and after stamping the tin-bearing pegmatite, a Frue vanner was used to separate the heavy cassiterite. These efforts were abandoned, however, not so much on account of the small percentage of cassiterite obtained as for the reason that the great proportion of mica in the pegmatite filled up the mortars, forming cushions and making it difficult to crush the quartz and feldspar. Another effort to exploit this tin area was made about five miles east of the village of King's Mountain, possibly eight years ago. On sinking a shaft on the supposed vein it was found that the granite in this place contained more manganese than tin, and much of the supposed tin ore was worthless tourmaline.

Within the last two months other veins have been found, presenting a more fascinating proposition for development. They show that the region containing tin is larger than had been supposed.

It should be noted that the isolated peak, called King's mountain, rising 4000 feet above the surface of the Piedmont plateau, in Gaston county, on the southern edge of North Carolina, is simply a part of the great granite area which characterizes the Piedmont plateau in this region. Extending northeast and southwest, on the southeast flank of the mountain, is a bed of limestone extending nearly to the summit. This limestone is also a characteristic feature of the Piedmont plateau, for many miles on the southeast flank of the granite. On its western edge it has been locally changed into marble. The junction of the granite and limestone is noticeable at Gaffney, in Cherokee county, South Carolina, near the North Carolina boundary.

About 1½ mile northeast from the town of Gaffney, and well into the granite are two parallel ridges of apparently fine-grained granite. Included between them, running the usual northeast and southwest direction, is a bed of red clay, interspersed with veins of kaolin, apparently a thoroughly decomposed pegmatite dike, perhaps 70 feet in width. Little effort has been made to determine its length. Through this clay crystals of cassiterite have been found in considerable quantity, so that it is hardly possible to pan the clay at any point without obtaining plentiful traces of cassiterite. Frequently the streaks of kaolin, in the red clay, contain more than half their weight of cassiterite. This clay has been prospected by trenches, by the owner, S. S. Ross, and in this development work he has gathered some three or four tons of fairly pure cassiterite, containing occasional bits of magnetite. The decomposed area containing tin ore is so large as to render washing operations for saving placer tin profitable. Water could be obtained about 10 miles away with sufficient head for hydraulicking. A smaller creek will furnish enough water for working a force pump against the face of the clay, a more economic method of prospecting the property. Arrangements for this form of development are now in progress. The interest aroused by this discovery has led to opening up at least half a dozen other pegmatite dikes, all containing more or less cassiterite, but not essentially different from those which years ago failed to maintain the interest of their developers. The ore strongly resembles the greisen of some of the Black Hills tin mines, although usually more decomposed.

The clay found by the writer also showed an appreciable amount of monozite.

American Capital in Mexico.

American capital is being attracted to Mexico by the unusual opportunities for profitable investment. Money invested there undertakes and performs things in a more economical manner than the Mexicans themselves have usually accomplished these things, and with better results. American engineers and American machinery have opened a new field in old mines. The Mexicans worked the mines to water level. When this was reached the limit of their resourcefulness was also reached, unless the workings could be drained by long tunnels, driven to reach the vein beneath the lowest work-

ings. American miners have taken many of these same old, abandoned mines and by installing suitable machinery have been enabled to work some of them with great profit. The mineral resources of Mexico are undoubtedly extensive, as has been proven by the past history of its mines, but a new era has commenced for Mexico, and it is not extravagant to say that her mineral wealth is only beginning to be appreciated by Americans. Mexico has produced hundreds of millions of ounces of silver. A Mexican authority has placed the production at \$3,000,000,000 and an impression seems to prevail that the mineral wealth of that republic consists principally of silver mines. This is not the case, for there are also extensive mines of gold, and these are constantly receiving more attention, particularly in the United States since the great depreciation in the price of silver. The latest statistics available place the yield of gold in 1900-01 at \$9,250,000. The output for 1902 has not yet been published, but it is thought it will show an increase over the former period. American capital is largely responsible for this increase in the gold output. Modern methods and American machinery have rendered the low-grade ore deposits available, as well as those of high grade, which latter in previous years attracted the greater attention. It is due to the low-grade gold mines that Mexico's gold output is on the increase. There are hundreds of thousands of tons of tailings which will be treated by the cyanide process, which will help to swell the output in no small degree.

Mining and Metallurgical Patents.

PATENTS ISSUED APRIL 25, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PULP DISTRIBUTER AND FEEDER.—No. 725,932; L. Cohen and J. Gross, Sombereete, Mexico.

Distributing feed device for ore pulp containing rotatable rolls consisting of cylindrical hollow body having closed end portions, and perforated or foraminated curved bounding surface, in combination with trapezoidal feed table and rotatable rolls located at longer of parallel sides thereof.

METHOD OF EXTRACTING GOLD FROM ORES.—No. 726,294; F. J. Hoyt, Chicago, Ill.

Method of milling gold ore consisting of pulverizing ore; distributing ore thinly over wide, long open sluice-way; flowing ore and propelling it forward over its bed by action of stream chemical solution adapted to dissolve ore; automatically screening and separating solution from tailings by same force; subjecting solution to reagent precipitate gold therein.

TUYERE FOR BLAST FURNACES.—No. 726,422; O. S. Garretson, Buffalo, N. Y.

Combination with furnace and tuyere, of blast pipe arranged above tuyere provided at outlet with stuffing box, and tuyere pipe having upper end arranged in stuffing box capable of being raised and lowered

in same and having lower end turned inwardly and detachably connected with tuyere.

APPARATUS FOR REFINING ZINC SPelter.—No. 726,432; T. Jones, Iola, Kans.

Combination with muffle, of water bosh disposed beneath same and provided in top with channel, and boxing housing forward end of muffle and having bottom provided with channel registering with water bosh and operating to conduct molten metal without furnace in case breakage of muffle.

CEMENT AND GRAVEL SEPARATOR.—No. 726,498; J. Behm, San Francisco, Cal.

Apparatus consisting of cylinder and adjustable supporting framework; annular tracks fixed around exterior of cylinder, and bearing rollers on frame engaging tracks; annular gears formed of sections bolted to cylinder; shaft extending along outside of cylinder provided with pinions to engage gears; power transmitting shaft extending transversely across head end of cylinder and intermeshing gears between two shafts; means maintaining transmitting gear in mesh with gear first named shaft consisting of boxes in which power shaft is journaled, boxes having slots transverse to axis, and bolts passing through slots whereby boxes and power shaft may be moved to maintain gears in mesh when inclination of cylinder is changed.

APPARATUS FOR CRUSHING OR CRUSHING AND SORTING ORES, ETC.—No. 726,521; E. Ferraris, Montepioni, Italy.

Ore crushing apparatus consisting of grinding cylinder divided into two compartments by partition parallel with heads of cylinder, partition being provided with opening for return of oversize ore and with openings intermediate between opening and outer edge of partition, means for crushing ore in one of compartments, means for sifting ore which has passed into other compartment and discharging sifted ore therefrom, and return cone situated in last mentioned compartment and adapted to return oversize ore through opening provided therefor in partition into crushing compartment for further crushing.

ORE TREATING PROCESS.—No. 726,802; B. T. Nichols, Montevista, Colo.

Mixing suitably pulverized ore with lime; applying water to mixture and introducing steam whereby pulp is agitated and kept at suitable temperature until certain impurities which retard leaching are freed; washing pulp by introduction of water and continued agitation, draining off water as far as practicable, drying ore.

METAL TREATING FURNACE.—No. 726,728; M. J. Murdoch, Youngstown, Ohio.

In metal treating furnace, combination with hearth chamber and fire chamber separated by bridge wall, of roof having horizontal section over hearth chamber, and depressed portion or drop constituting crown of fire chamber, depressed portion or drop including inclined updraft section lying above bridge wall and meeting horizontal roof section, also including separate inclined section reaching front wall of casing form therewith, closed gas pocket in front upper corner of fire chamber.

TAPPET FOR USE IN STAMP BATTERIES OR THE LIKE.—No. 726,624; M. Bodley, Johannesburg, Transvaal, South Africa.

Tappet comprising two members hinged at one side and adapted to embrace shaft, edges of members on opposite side having overlapping portions provided with aligning openings, fastening rod passing through opening in side of one of members for keying tappet to shaft.

PROCESS FOR EXTRACTING GOLD.—No. 725,895; M. V. Uslar and G. Erlwein, Berlin, Germany.

Process for extracting gold from auriferous ores, lixiviating ores with solution of potassium cyanide, hyposulphites and sodium chloride.

Ore Treatment at Mt. Lyell.*

The company has eleven blast furnaces, arranged in two smelting plants, the older or No. 1 plant containing six blast furnaces, and the newer plant, No. 2, five. The latter furnaces were built according to experience gained in the operation of the former, and were made considerably larger, the respective sizes in the plane of tuyeres being as follows: No. 1 plant, 40 inches by 168 inches (except No. 3, which is 36 inches by 126 inches); No. 2 plant, 42 inches by 210 inches; the height in each case, from the tapping to charge floor, is 20 feet over all; the height of ore column above tuyeres is 9½ feet; the number of tuyeres (3 inches throughout) is thirty-two in No. 1 plant (twenty-four in No. 3 furnace), and forty in No. 2 plant. The furnaces are water-jacketed high up, the jackets all being cast-iron, with the exception of the small steel plate tympan jacket. At the present time it may be said that three of the large furnaces of No. 2 plant practically smelt into first matte all the ore that is delivered, while two furnaces of No. 1 plant are devoted to the concentration of the first matte into converter matte, and only occasionally treat ore alone. Under these circumstances, each furnace of No. 2 plant sometimes smelts up to 350 tons of Mt. Lyell pyrites per diem, and the average, as calculated from the four weekly returns, is about 270 tons of pyrites daily. Phenomenal tonnages are occasionally reached; thus, No. 6 furnace recently treated a total of 724 tons of material (matte, silica, limestone and slag) in a single day. This vigorous work is due to the fact that the amount of air formerly distributed to the large number of furnaces is now supplied to the smaller number. Simultaneously the blast pressure also has risen, until it is now on a level with the pressure made use of in the progressive matte-smelting establishments of the United States and British Columbia, and ranges from thirty-six to forty ounces at the blowers, and from thirty to thirty-four ounces at the furnaces, the difference at the two points being loss by friction in hot blast stoves, blast mains and furnace connections. To meet this higher pressure no alteration was made to the furnaces, except the raising of the sump, i. e., the elevating of the overflow level of the furnaces by several inches for the proper tapping of the blast, the same as before.

At the same time, important improvements were also made in the motive power department by the installation in each smelting plant of steam saving appliances, consisting of Green's economizers, with induced draught fans and a system of steam superheaters. The economy effected by the economizers is determined as 15%, and by the superheaters as 16%, total saving 31%. The waste heat of the fireboxes of the hot blast stoves, in addition to that of the boilers, contributes to this high result. The steam plant of the Smelting Works is, therefore, entirely up to date, and the various improvements have succeeded in lowering the cost of power to what must be regarded as the local minimum. The fuel employed is still chiefly firewood, the use of coal being merely auxiliary. The respective consumptions under the boilers were, for the year, 36,443 tons of wood and 1794 tons of coal.

The work done in this department for the year was the highest yet performed. There are six 124 H. P. boilers available in each smelting plant, two in each case now being in reserve. The average indicated horse power was 1905; total engine revolutions, 310,000,000; air delivered to furnaces, 31,000,000 cubic feet, weighing 1,054,000 tons. The air was heated to an average temperature of 580° Fahr., thus absorbing 291,500,000,000 British thermal units out of the combustion of 49,000 tons of firewood in the hot blast stoves. The latter have continued to give every satisfaction. In point of repairs the eight stoves (four in No. 1 plant, with fifty-six cast-iron U tubes each, at 16 cwt., and four in No. 2, with seventy U tubes each) have given practically no trouble, there having been only about a dozen tubes completely replaced since the beginning, on account of burning out. The number of hands employed in the smelter motive power departments is eighty, comprising engine drivers, firemen, cleaners, wood handlers, etc. It may be mentioned that, for the production of the blast, there are in use nine vertical compound condensing engines, 12 inches and 22 inches by 18 inches, set up in marine style, and direct coupled, by means of a flexible coupling, to a No. 8 Root's blower, each of 116 cubic feet displacement; also one reserve No. 7 Root's blower with vertical engine attached, ordinary style, and two reserve No. 7 Root's blowers, belt driven from a horizontal tandem compound engine, 12 inches and 20 inches by 30 inches. The power plant thus follows the unit system, i. e., each furnace has a blower driven by an individual engine, although the blast is not conducted to each furnace separately, but directed into a common blast main. The condensers are of the surface type (1000 square feet), also with vertical compound engines, 6 inches and 12 inches by 6 inches, and air pumps to suit—the latest with Edwardes' pump.

The following are the statistical figures of ore treated, rendered by the company for each quarter of the past year:

Treated.	Quarter ending Sept. 30, 1901.	Quarter ending Dec. 31, 1901.	Quarter ending March 31, 1902.	Quarter ending June 30, 1902.	Total for year 1901-2.
Mt. Lyell ore.....	Tons 69,289	Tons 65,688	Tons 71,111	Tons 79,969	Tons 286,057
Purchase ores.....	21,257	20,731	11,680	4,841	58,509
Metal bearing fluxes..	5,726	6,480	7,702	8,139	28,047
Total.....	96,272	92,899	90,493	92,949	372,613

It is thus apparent that the average per day was the treatment of over 1000 tons of raw mineral-bearing substances, besides which the company has treated in its blast furnaces all the first matte, converter slags and linings, flue dust and all similar middle products formed in the process.

It may be remarked that the grade of the first matte at present does not exceed 15% copper, being a concentration of from six to seven, and more, from the original ore into first matte, all of which work is practically performed, as remarked, by the furnaces of No. 2 plant. The re-treatment of this first matte, or concentration of same, by the furnaces of No. 1 plant, raises its grade to 45% and 50% copper, which is the standard required for proper economical hessmerizing into blister copper.

The output of the furnaces in copper, silver and gold, for the year under review, is as follows:

Output.	Quarter ending Sept. 30, 1901.	Quarter ending Dec. 31, 1901.	Quarter ending March 31, 1902.	Quarter ending June 30, 1902.	Total for year 1901-2.
Fine copper in blister (tons)....	2,630	2,579	2,520	1,870	9,608
Silver, fine (ozs.)....	164,932	160,102	182,487	171,133	678,654
Gold, fine (ozs.)....	5,224	5,002	5,650	5,555	21,451

The total money value of this year's output, calculated upon the changing quotations for the copper and silver, is given as £765,584.

The grand total of ore treated since the beginning of smelting operations on June 25, 1896, up to March 31, 1902, as given in the company's last report, together with average assays, is as follows:

Treated.	Total tons.....	Average Assay.		
		Copper, per cent.....	Silver, ozs....	Gold, ozs....
Mt. Lyell mine.....	1,160,684	3.00	2.81	0.101
Purchase ores.....	154,923			
Total ores.....	1,315,607			
Total metal-bearing fluxes.....	33,023	1.64	0.21	0.020
Grand total ores and metal-bearing fluxes.....	1,348,630			

The principal consignor of outside purchase ores was the North Mt. Lyell Co., which has supplied half the total. Then, in order, follow the Lyell Tharsis, Mt. Lyell Blocks, and the old South Tharsis Co., while small lots have been received from the King Lyell, Duke Lyell and Prince Lyell companies. The North Mt. Lyell Co. completed its contract shortly after the end of the year. It is interesting to state that the average assay of all the purchase ores, representing, as it does (with the exception of a quantity of rich ore shipped to England by the North Mt. Lyell Co.), an approximation to the average value of the siliceous hornite ores of the district is: Copper, 6.70%; silver, 1.93 ounce; gold, 0.002 ounce. The Mt. Lyell pyrites, therefore, though lower in copper, are relatively higher in silver and gold than the average hornite ore of the district. The aggregate average assay of all ores treated by the company in the course of time is: Copper, 3.44%; silver, 2.70 ounce; and gold, 0.090 ounce.

The following last half-yearly average analyses may be of interest:

	Silica, Per Cent.	Iron, Per Cent.	Alumina, Per Cent.
North Mt. Lyell.....	63.70	6.22	10.10
Lyell Tharsis.....	64.00	5.08	17.25
Mt. Lyell Blocks.....	60.91	7.91	10.60

If the returns for the quarter from the end of the company's half year to that of the statistical year are added to the above, the results are as follows:

	Tons.
Mt. Lyell ores treated.....	1,240,653
Purchase ores.....	159,764
Metal-bearing fluxes.....	41,162
Grand total.....	1,441,579

tons of local ores furnished by the company from the beginning to June 30, 1902.

Besides the above-mentioned, there have also been smelted the following quantities of other materials from commencement up to the end of the company's last half year (March 31 last):

	Tons.
First matte.....	271,913
Silica flux.....	327,183
Limestone flux.....	182,202
Flux slag.....	281,134
Coke used at blast furnaces.....	81,044
Flue dust re-treated.....	24,022
Converter slags.....	45,223

The Armstrong Cutting-Off Machine.

The Armstrong Bros. Tool Co. say that in the manufacture of their tool holders it is necessary to cut off large quantities of self-hardening steel into cutter lengths. Experience has taught that this class of steel gives best satisfaction when cut off cold. The ordinary shop practice has been to cut the steel off hot or to break it off on the anvil. The objection to the latter method is that the break is liable to be very irregular, resulting not only in a serious loss of steel, but also in vastly increased grinding, with attendant waste of time and emery wheels. After experimenting with various methods of doing this work, they have developed the machine herewith illustrated, which in a slightly different form has been

Cutting-Off Machine.

in use in their works for about two years, and which they claim has given perfect satisfaction, and with practically no expense for maintenance. The cutting is done by a disc of special grade tool steel revolving at high speed. Any attempt to cut soft steel or ordinary cast steel with a disc results in a rough dragging cut with flaring lips, which hind the disc to such an extent as to reduce its speed to a point where it is ineffective, if it does not actually bend or break the disc. Owing to the peculiar nature of self-hardening steel, however, it is not affected in this manner by the cutting disc, which makes it, even when forced hard, a clean, clear-cut incision. The periphery of the disc is coated with self-hardening steel particles, and these particles do the actual cutting.

Having had numerous inquiries from machine shops regarding this method of cutting off self-hardening steel, they have decided to place the machine on the market.

Its convenience and economy, they say, will make it a paying investment for any machine shop. The machine is of combination form, the steel-cutting disc being mounted on one end of the spindle, while the other end of the spindle carries a 12-inch grinding disc. The speed at which the machine is intended to run is such as to give the best results for both operations. The construction of the machine is first class. The spindle is of tool steel ground true. Bearings are cast iron and are dust proof, with convenient and positive adjustment for wear and to take up lost motion. The swinging table is provided with a length gauge and is conveniently adjustable for steel of different sizes or depth of cut. The cutting disc is provided with a neat guard, which can easily be swung back out of the way when changing disc.

The grinding disc is made of boiler plate and is provided with an adjustable table, so located that the operator will not interfere with cutting off long bars of steel. Each machine is equipped with counter shaft, one cutting disc, one grinding disc, one breaking hock, one press for emery discs, one dozen emery cloth discs assorted, one pound lubricating grease and one can special cement for attaching emery cloth to grinding disc.

*From the report of the Secretary of Mines, Tasmania.

Oil and Dust From Rock Drill Use in Mines.

It is an encouraging sign of the times that the question of the health of the miners should receive such serious consideration as is recently being given it in connection with work in mines. In South Africa a commission has been appointed and it is alleged that laws are to be passed specifying certain regulations by which the lives of the miners will be prolonged, says the Compressed Air Magazine. Opinions differ as to what causes the trouble, but no one doubts the fact that the lives of miners have been shortened by some of the conditions that exist in mines, and particularly in the African mines. It is well known that ventilation is an important auxiliary to men working in mines. Bad ventilation in mines is just as hurtful as had ventilation anywhere else, and unless the miners have good air to breathe they are liable to be affected by disease, especially so as the damp atmosphere in the mine and the changing degrees of temperature cannot be considered as favorable conditions. Some think that oil either from the air compressor or from the rock drill is responsible for the miners' diseases, and cases have been cited where asphyxiation and even death have resulted from the discharge of "bad air" into the mine through the pipe leading from the engine room. We have a record of perhaps the most serious case of this kind, one which occurred several years ago in a Western mining field and which resulted in the death of more than a dozen men, the direct cause being a fire in the engine room, and as the air compressor throttle had not been closed the machine continued to work while the building was burning all around it, hence the products of combustion were sucked into the compressor and forced into the mine, the miners being ignorant of the existence of a fire on the surface and having no means by which to discover the trouble until it was too late to prevent serious consequences. Here is an accident which cannot be compared with normal conditions, and yet it has a bearing on the case, because it points to unforeseen possibilities and also to the importance of discharging only pure air through the line pipe into the mine. Pure air is not always compressed by air compressors. This is due sometimes to defects in design and at other times to negligence. A properly designed air compressor when used to pump air into a mine should have compound air cylinders, with intercoolers and aftercoolers. To compress air up to pressures from 75 to 100 pounds in one stage—by a single blow, as it were—is to heat it beyond reasonable temperatures and to turn the air to such an extent as to produce unhealthy conditions. Stage compression means a gradual piling up of pressure with a gradual increase of temperature and no smell from burnt oil or other particles which are often taken in with the air and heated to excessive temperatures during compression. By stage compression not only are lower maximum temperatures produced, but the air is brought down to atmospheric temperatures when passing through the intercoolers and aftercoolers, and in this way less power is consumed in compressing the same volume of air to the same pressure, and such things as oil, smoke, water and dust are collected by the cooling devices and blown off just as sediment may be blown off from a boiler.

It is said that oil when discharged from the exhaust of rock drills is hurtful to the miners and that it interferes with the amalgamation process. As to its being hurtful to the miners, we can scarcely agree as to the possibility of this, as when the oil is discharged from the exhaust it is at such low temperatures as to be condensed into a liquid which drops to the floor or is blown against the walls of the mine. In other words, it is not in the condition of a vapor or gas. As to its interfering with the amalgamation process, the late Mr. Collins of the Smuggler-Union mine at Telluride, Colo., who was an acknowledged expert in all that pertains to mines, made some exhaustive experiments to determine the effect of oil upon the amalgamation plates, the results being uniform in each case and showing no effect whatever. Oil floats on the surface of water, while the particles of gold sink to the bottom. Oil being lighter than water, it is not at all likely that it will carry particles of gold with it. But whether oil, when used in rock drills, is hurtful or not, it is plain that too much oil is used and too little attention is given to the wastefulness of oil. When a rock drill becomes worn its efficiency is much improved by frequent doses of oil. This is especially true of rock drills that have independent valves—that is, valves that are not moved by direct mechanical connection with the piston. The oil fills up loose spaces and with the aid of lubrication the machine works more like a new one. Of course, the proper plan to pursue when a rock drill is worn is to take it out of the mine and repair it, because a loose piston and a loose valve waste air, and in most mines they are wasteful also in oil. However this may be, a runner usually keeps the machine at work until it breaks down or will not work any longer, so that it becomes important to recognize this situation and endeavor to save in some other direction. It is had enough to waste air, but when so much oil is thrown away this wastefulness becomes important and even

serious. A little soap and water will save money and accomplish the same results when fed into a worn rock drill, and nobody will claim that soap and water interferes in any way with either the health of the men or with the amalgamation process. It is cheaper than oil, it is a fair lubricant, and in the cold passages of the rock drill it becomes thickened and serves an excellent purpose in filling up loose spaces. It cannot injure the machine, provided it is not allowed to remain in the machine when it is idle, as in such a case as this it might produce rust. Just before shutting down the rock drill oil should be run through, and in this way the soap and water will be neutralized by the oil and the machine made free of rust.

The real cause of the so-called miner's consumption is, in our judgment, due to the fine particles of dust that permeate the atmosphere and become impregnated in the lungs of the miners. This dust is excessive only in dry hole work or in raises where it is difficult to introduce water into the hole in the process of drilling, but it is quite possible to prevent this entirely by the injection of water through the drill steel, or by forcing it through a tube which is placed alongside of the steel, and which is connected to a common bicycle foot pump. The trouble is that too little attention is given to matters of this kind, because dry hole work in mines is not general and the miners do not care to change to any special appliances when engaged in this work. It is quite likely, however, that agitation of the subject will result in the introduction of practical appliances by the use of which excessive dust in the mine may be absolutely prevented.

Lubricator for Feeding Soap Suds to Compressors.

In compressing air to 90 and 100 pounds gauge pressure with a single stage air compressor, the temperature of the air after compression frequently reaches 450° to 500° F. This high temperature results in more or less carbon being deposited on the discharge valves and passages, and trouble is often experienced in properly lubricating the air cylinder.

Especially is this the case where compressors are run at high speed and the temperature of intake air exceeds 80°, or where an inferior grade of oil is used. To overcome this trouble soap suds has frequently been used as a lubricant instead of oil with good results.

The illustration shown herewith shows a novel way

Feeding Soap Suds Into Cylinder.

of feeding soap suds into a cylinder provided with piston inlet valve, and will, no doubt, be of interest to engineers who are using machines of this kind, who have experienced the trouble referred to above. The device consists of a small galvanized iron water tank (A) about 7 inches long, 6 inches wide and 12 inches deep. Inside of this tank is a smaller one (B), which is soldered to the large tank, and the bottom of which is about 2 inches above the bottom of large tank. In the bottom of small tank are a number of holes $\frac{1}{8}$ inch in diameter, shown at (C). Soft brown soap (cut up in small pieces) is put into tank (B). Water is then fed into large tank through a $\frac{1}{4}$ -inch pipe (D) and passes through small holes at (C), dissolves some of the soap and raises to top of $\frac{1}{8}$ -inch pipe (E), through which it passes down into inlet of compressor. The water is regulated at (D), the small cock under tank being left wide open. Just before shutting down compressor the water is turned off at (D) and oil is fed into the small tank (B) from cup (G). The compressor is then run with oil for half an hour in order to prevent rust. It is import-

ant to use soap that will sink in water, otherwise small chips of soap will float to top of tank (B) and pass down through pipe (E).

This device is used on an Ingersoll-Sergeant compressor having a steam cylinder 14 inches diameter by 18 inches stroke, and when running at 120 revolutions per minute with air pressure at ninety pounds, the water is fed through (D) at about forty-five drops per minute. Soap suds has been used in this cylinder for the past four years and no trouble whatever has been experienced in properly lubricating it. The engineer reports the walls of cylinder in perfect condition.

The arrangement shown has been used with much success at the power plant of the Terminal Railroad Association in St. Louis, Mo., and was made by the chief engineer at that plant, E. A. Kolbe.

Were the Nome Gold Fields Previously Worked by Russians?

Written for the MINING AND SCIENTIFIC PRESS by OTTO HALLA.

It is evident from discoveries made in the Nome gold fields that at least part of the fields were known prior to the advent of the American miner. Evidences exist that clearly establish that the diggings were worked intelligently, though it may have been a century ago, or more, when gold was mined from the creek in what is now known as the Cape Nome district.

The present generation of Esquimaux, living at Port Clarence harbor and Norton sound, did not have traditions of any gold discoveries. It is probable that, had the Esquimaux known of the existence of gold and its value, the discoveries would have been made prior to the last few years, in view of the fact that the Port Clarence harbor was a rendezvous for many years back of whalers, more so in 1850 to 1870 than now, and a fleet of ships frequently wintered for seven months in that locality, and it can be plainly seen that a discovery known to the natives would have been communicated to the seamen, if through no other channels, than through the Esquimaux maidens. Last summer parties working a claim on Gold Run, one of the richest in auriferous gravels, were opening the property preparatory to constructing a hedrock dam for sluicing. The claim has been well prospected, and it was noticeable that in the locality where the hedrock dam was to be placed the pay has given out.

Upon further investigation, and at a depth of 7 feet from the surface, the workmen came upon a regularly constructed stone wall, which went down to bedrock of the creek 8 feet deeper. This work was done in such a manner as to leave no doubt that the work was done by white men with a good knowledge of engineering and was the work of several weeks, if not of months.

The discovery of Gold Run attracted considerable attention in 1900, and based upon the discovery the famous town of Teller on Port Clarence harbor sprang into existence, a town of more than 700 houses, and which at one time threatened to outgrow the northern metropolis, Nome. It was even reported in the fall of 1900, after the Anvil Creek case had been taken out of the Nome courts, that Judge Noyes would transfer his headquarters to the new town. Strange as it may seem, only three or four claims have sustained the reputation first gained for the creek, the balance of the creek proving a disappointment. Not that it did not pay to work—far from it; there is pay throughout the entire creek, but it is not like Anvil Creek. Naturally, upon this discovery the court gave up the idea of moving; the city authorities of the new boom town, after a brief few weeks of power, dropped back to Nome one after another, until towards the fall of 1901 Teller claimed not more than fifty people. This year it will be one of the modern ruins, as the wind and blizzards hold high carnival for six months on Port Clarence harbor.

It would indicate that the lower part of the creek was previously worked, and there could not have been any one else operating other than men with abundant means, as the expense for the necessary provision to sustain life during the time of work must have been considerable. Another discovery was made on Hungry creek that tends to show a previous knowledge of gold in that creek, a rocker of ancient make buried about 6 feet deep from the surface and a silver coin, such as are worn as a charm, and bearing the date of 1700, were found.

It is considered likely that Russian exiles were driven across the Siberian continent to Alaska, and compelled to work for their masters. It is problematical if the higher Russian authorities ever knew

of the wealth of Alaska, but there is no doubt the Russian explorers of Alaska knew more than they cared to divulge. There are evidences of their explorations on every prominent hill of the Seward peninsula, each having a stone monument with a flat center piece, indicating the direction of east and west. It may have been to the interest of the Russians to keep their secret and benefit by it themselves, but as the "unexpected always happens," they may not have reckoned with the idea that the Czar might sell that country, and seeing all communications broken, the land of gold lived only in their memories, and in time the secret was buried with them, until new people discovered the gold anew and new enterprises sprang into existence, and wrested from the frozen soil its treasure.

The Georgia Gold Belt.

Written for the MINING AND SCIENTIFIC PRESS by F. M. SCOFIELD.

Present interest and developments in this field give good promise of opening up much valuable mineral territory. Since its discovery, the State of Georgia has produced over \$20,000,000 in gold alone, and nearly all of it has been taken from above water level. It is surprising that the country has never been thoroughly tested by experienced mining men, with capital, willing to venture upon such splendid surface indications as this State shows to the experienced prospector.

One thing that has held back development in this section, probably more than anything else, is the fact that the prospector has no show here whatever, all lands being in the hands of private owners, with whom proper arrangements must be made before any prospecting can be done. It can be readily seen that as all gold countries are opened up by the poor prospector, this country gives him no encouragement, inasmuch as he first must purchase any territory which may look attractive to him for prospecting purposes.

Notwithstanding this very serious drawback, the mining interests have, within the past year or two, been coming rapidly to the front, and with it the deeper developments which we have all waited for anxiously, knowing that this only would make or condemn our standing as a profitable mining country. Inasmuch as all of our earlier development work was undertaken by men with little or no practical experience, and controlled by the very mistaken idea that mining was such a simple business as to require no more than a general knowledge of its many intricacies, the mistakes that were necessarily made put the mining district in a much worse light to the investing public than if there had been nothing done at all.

The fact that we have survived so many disastrous experiments speaks well for the stability of our future. Capital has persevered and experience has at last taught it to secure men of known ability at whatever cost, and the result is that many propositions are showing up so well as to make their owners feel thankful of having been so persevering under adverse circumstances.

The Crichton mine, the oldest in Georgia, has recently been shut down the first time in nearly twenty years, and that for the purpose of closing out the property for the various heirs of Aaron French, who recently died. In the investigations for the executor, the experts report a large body of ore on the levels from 600 to 900 feet depth, and average ore values of \$6 per ton, in addition to which they have recently opened up a pay streak of \$25 ore. Their very large acreage (about 1000 acres) will make this mine prominent among the producers of low-grade ore.

In White county an Atlanta company have been for many months opening up a pyrite mine, and two reports recently made by different experts, one of them for the Southern R. R. Co. to ascertain the advisability of putting in a 20-mile spur, both nearly agree in reporting the large amount of ore in sight. The company were only looking for the pyrites for commercial purposes, but have found gold and copper values more than sufficient to pay all costs of mining. They have about 300 acres and have only developed to 200 feet deep.

At Tallapoosa, Ga., the Tallapoosa mine, which has been closed for about five years on account of litigation, is now going again, at about 200 feet deep. The present superintendent reports that they have the vein well opened, with values running about \$11 per ton, with 10 feet in width. They also have a 2-foot pay streak of \$30 ore. They are operating forty stamps and eight tables and expect soon to add twenty more stamps. This was a good dividend payer when worked before.

A good strike was recently made in Gwinett county of high-grade ore, running \$150 to \$300 per ton, and many good prospects in this county indicate this to be possibly among the most promising of the whole gold belt for high-grade returns.

Hall county has many promising prospects, upon some of which have been done a good deal of development, the owners of which are enthusiastic for their future.

THE speed of engines with reference to hoisting capacity is figured carefully in all hoisting engines,

and particularly in specially designed plants, and when this running speed is exceeded damage is likely to result to the machinery. Consequently, it is better to allow a large factor, not only for safety in present needs, but for increased capacity or greater depth.

Hydrostatic Level Attained by Ore-Depositing Solutions.*

Written by WALTER P. JENNEY, E. M., Ph.D., Salt Lake City, Utah.

In the limestone area of Tintic and other mining districts of the Great Basin region of Utah, it has been observed that surface outcrops of ore occur but seldom and are mainly confined to points of relatively low elevation, where the veins cross some basin or ravine. Nowhere does a considerable body of ore outcrop on the tops or high up on the slopes of the hills.

Mining operations, on the other hand, have shown that large and continuous ore deposits frequently occur in depth in the limestone, beneath large masses of barren rock. Such ore bodies, when followed upward in the lodes, are found to terminate at well defined levels, without reaching the surface. Yet the ore-bearing fissures themselves extend above the top of the ore, being often traceable, though barren of all valuable minerals, for hundreds of feet above the slopes in the mines, and even observable in outcrops at the surface.

This abrupt cessation of the ore at a uniform horizon does not appear to be connected with any change in the country rock adjacent to the lodes. The strata above and below this horizon seem to be in every way equally favorable to ore deposition. Explorations above it have developed an open-fissured country, barren not only of ore, but also of indications that mineral-bearing gold, silver, lead or copper were ever deposited in the strata at that elevation.

The height reached by the ore, while usually constant throughout the length of a given lode, may vary in particular sections from the operation of local causes. Each lode in a district has its own distinct horizon, above which the ore deposits do not extend. Where the ore bodies are continuous for a long distance on the strike and other conditions are uniform, the top or apex of the ore is nearly level or gently undulating; but more commonly its upper surface is broken into a series of peaks and pinnacles, alternating with flat summits and wave-like crests, reaching up from the main ore channel to practically the same relative altitude, and forming the ore crest or mineral crest of the lode.

Examination discloses in these mines many evidences that the terminal edge of the ore nearest to the surface represents, substantially, the height to which the mineral-depositing solutions ascended in the fissures during the period of ore formation; in other words, that the present ore crest is the high-water mark, or ultimate level, reached as the result of the ascensional force of the heated ore-bearing waters.

In some instances lines of extinct mineral vents, nearly over the ore bodies, on the surface, mark the course of the lode. These are small local outcrops of quartz, chalcedony, siderite, ankerite, barite and other gangue minerals, seldom carrying more than traces of the precious metals. It is not improbable that, during the period of ore deposition, these vents were geyser-like pipes or channels extending from the ore deposits, hundreds of feet below, up through the non-mineralized strata to the surface, and constituting points of escape for steam and gases liberated by the chemical reactions incident to the formation of the ore. Surface explorations of some of them indicate that they were channels of up-flow for the waste waters expelled by the pressure of the steam and gases after the deposition of the ores in the deeper strata. Among other evidence supporting this view is the occurrence in thick, banded sheets, lining crevices and open channels in these outcrops, of white, translucent chalcedony, a mineral deposited by hot silica-bearing waters.

To better understand these peculiar phenomena, it is necessary to consider the conditions attendant upon their formation. The earlier volcanic disturbances of the region are regarded as the direct cause of the elevation of the districts and the upturning of the sedimentary rocks, producing the numerous small mountain ranges and solitary island-like upheavals which illustrate the varied types of the Basin Range structure.

These earlier disturbances were followed by a long period of comparative rest, during which a wet climate prevailed and an extensive erosion of the exposed strata occurred, carving the surface of the districts to nearly their present contour. There were the same low mountain ranges, with spurs projecting like promontories into the sands of the desert, their steep slopes deep cut by narrow, rocky ravines, or scooped out in basin-formed gulches.

Later disturbances, deep-seated in the earth's crust, formed the vein fissures and induced the deposition of the ores at a time when the topography of

many of these mining districts varied little from the present surface. The recent erosion, which has taken place since the deposition of the ores, has probably not removed, even on the more exposed slopes, more than 100 to 200 or 300 feet in depth of rock surface. This preservation of the ancient topography has been due, in great part, to the change in climate. In the present extremely dry period surface erosion is reduced to a minimum. So little are the outcrops of the ore bodies eroded, that the conclusion seems inevitable that the present arid climate has prevailed continuously since their formation.

In such districts the outcrop or intersection of the vein fissures with the old surface erosion would be, in profile, an irregularly broken or serrated line, rising from the lowest points, where the fissures crossed some deep ravine or basin, to summits where the fissure belt cut through the tops of the hills or divides. Under these conditions, the mineral solutions, forced upward in the fissures, found outlets of escape at places of relatively low elevation along their course, with a consequent reduction of head or hydrostatic pressure so great that, no matter how open the fissures, or how favorable the ground, no considerable deposits of ore could be formed above a certain level, depending upon the elevation of the outlets and the volume of the discharge through them of the heated waters, with the accompanying steam and gases.

Not only has the hydraulic head been controlled by outlets to the surface, but the escape of the solutions from the fissures into the walls and into the country rock adjacent, especially in mines in limestone, has also acted to some extent in the same way. The slow circulation of the mineral-depositing solutions through large caves or chambers, or through the interspaces in great masses of brecciated rock, from the extent of surface exposed and the free escape of steam and gases, has caused a reduction of both temperature and initial pressure.

During the long period of ore deposition, fluctuations caused by any increase or diminution of pressure or of temperature in the ascending waters would naturally occur in the hydrostatic level. It must have been subject to various accidents, such as the opening of new outlets at lower levels, or the choking or closing, by any cause, of outlets long in action. Moreover, the upflow through the fissure would be modified by crustal movements opening or closing its channels, and thus affecting both its volume and its pressure. Many other factors—for instance, the specific gravity of the solutions and the proportion of steam and gases mingled with them—must have had their effect.

The mixture of a liquid with a gas reduces the weight of a given column; and, when this column is under a hydraulic head not thus affected, this reduction of its weight is equivalent to increase of pressure in augmenting its flow. Friction produces a loss of effective head, which rapidly increases in rapid or tortuous channels, and must become very great where the solutions spread out and traverse the interspaces of fractured or brecciated rocks.

Since the completion of the primary ore deposition, oxidation and reformation of the minerals have tended to move the ore crest downward in the fissures; but the quartz and other gangue minerals remain, together with oxidized ores, in such quantity that there is usually little difficulty in determining the original crest level.

In most mining regions erosion has been so great since the period of mineral deposition closed that many hundreds and often thousands of feet of strata have been removed, destroying all record of what occurred in the upper parts of the veins. So far as observed by the writer, mineral crests such as have been described above occur only in those districts in the Basin region where, at the time the ores were deposited, the surface was deeply cut by erosion, and the later climatic conditions have been such as to preserve the old surface with little alteration—a combination of conditions which must be regarded as exceptional.

Now that attention has been drawn to this subject, it is not improbable that like occurrences will be found in other mining regions of the world; and we may certainly look for the discoveries of similar deep-seated ore crests not formed and determined chiefly, or at all, by the position of surface outlets, but due to the inadequacy of the initial pressure of the heated water to force them to the surface—a condition comparable to that of many artesian basins, where flowing wells do not exist, because the hydrostatic level is underground.

The observations of the writer indicate that ore crests are not confined to veins or lodes of replacement in limestone, but may occur in fissure veins in quartzite, and in lodes traversing eruptive granitic rocks.

A NOVEL SUBSTITUTE for hemp packing has been introduced by Mr. Firey, superintendent of the Silver Lake mines, at Silverton, Colo. In the stuffing boxes, as a packing and bearing, he is using a compound of chilled shot with graphite or paraffine. As it becomes warm, a little more is introduced, and it has never yet, any part of it, to be thrown away, and is said to do excellent work. The shot must be of such size that it will not work out. Where it is necessary to mould the packing paraffine is used, otherwise graphite.

Slate Creek Camp, Washington.

Written for the MINING AND SCIENTIFIC PRESS.

Slate Creek camp is situated on the west side of the Cascade mountains, near the summit, at an average elevation of 5000 feet above sea level, in the northeast corner of Whatcom county, about 12 miles south of the 49th parallel. It is accessible from both the east and west. At present there are about 40 miles of trail to be traveled coming from the west, but the Bellingham Bay Railroad is building towards it, and within a year or two transportation will be more convenient. At present most of the travel comes from the east, leaving the Great Northern Railroad where it crosses the Columbia river, then up the river by steamer 80 miles, then 60 miles of wagon road to foot of the main range, the last 10 miles to the camp being over a narrow gauge wagon road, which the miners have built to transport machinery. This road is 4 feet wide, and was laid out by an engineer on a gradient of 6% to 9%. Over this road, or trail, there has been hauled four quartz mills into the camp, besides many tons of mining machinery. Specially constructed wagons are used. These are about 26 inches high and 28 inches wide. Two horses, working tandem, will take a ton over the trail in a day. The accompanying illustration

Mortar at Foot of Slate Creek Trail, Washington.

shows a 6000-pound mortar being moved to the Mammoth mill. The wagon used was made of heavy timbers, the wheels being sawed from logs, and the mortar swung close to the ground, between the wheels.

The formation of the country rock is mostly quartzite, with strata of black slate, cutting through, and it is noted that where a lode cuts through the slate the ore is generally larger and richer. The lodes as a rule cut through the ridges nearly east-west with a dip of 50° to the north. The side hills are steep, and in nearly every instance development work is commenced on the lode and consists of drifting, and will give about 1 foot of back for each 1½ foot driven thus for the time being, doing away with hoisting and pumping of water, of which latter there is a large amount. Some of the more noted claims in camp are the Eureka, Mammoth, Chancellor, Mountain Goat and Mill Creek, each consisting of a group of claims, of which, perhaps, the Mammoth can be taken as representative.

The lode crops at the creek and at intervals up the side hill to the top of the ridge, a difference of elevation of some 900 feet. The main workings consist of a drift started on the lode about half way up the hill and driven in 1000 feet on the lode.

The ore lies in shoots, dipping about 40° to the east, and in width varies from 1 foot to 9 feet. The average value of the ore so far cut is \$20 in gold per ton, of which 60% to 70% is free, the balance of values being in sulphides, of which there are about 4%. There is little barren quartz. The present face is 700 feet below the surface and the percentage of free gold remains the same as near the surface. There is often found fine specimens of free gold and tellurides in different forms. Generally there is associated with them considerable lead and zinc. The ore is always rich, assaying \$10,000 to \$100,000 per ton. So far the rich spots have been found

where the lode cut the slate formation, and the most was found in the first main shoot encountered in driving the drift, which was 90 feet below the surface. The company are sinking a shaft with the view of sinking to 500 feet on the ore. Chunks of nearly pure lead are found at times, and these always assay high in gold, seldom under \$60 and often \$1000, while the silver contents is small, not over 10 ounces per ton, the mine generally carrying one-half ounce silver per ton. The Mammoth company first put in a small steam mill made in sections and packed in on horses, the building being entirely of logs. This mill, while proving to be a very shaky affair, owing to poor foundry work, was run until \$30,000 had been taken out, which proved the free milling character of the ore. The company has now installed a modern mill of 1000-pound stamps, with 24 feet of copper-silvered plates to each five stamps. There are four concentrators. They are also erecting a small chlorination works to treat concentrates. The mill is located 4000 feet from the mine and the ore will be sent down by aerial tram. The power for the mill will be water under a 400-foot head, which will also serve to drive an 8-drill compressor, which will furnish air for machine drills and pumps.

The Eureka is about 1 mile from the Mammoth and was equipped with a 10-stamp mill with sectional mortars, and operated by steam. The sectional mortars not proving satisfactory, and wood in the vicinity becoming scarce, they are arranging to install electric power to generate, for which there is abundant water power near. This property turned out a large amount of gold while running, the main ore body being 28 feet wide in slate formation. They also found very rich tellurium ore.

The Mountain Goat has completed a small cyanide mill, the gold in their ore being finely disseminated through the quartz. The Mill Creek has a group of claims 6 miles from those mentioned, and while none of the quartz shows free gold to the eye yet it pans rich. The character of the quartz is about the same as that in the rest of the mines in the camp, with the exception of containing more copper pyrites in some of the shoots. Where the copper is encountered the ore is always rich in gold, assaying \$50 to \$250 per ton. The lodes are well defined and have been traced by crosscuts on the surface for over 1 mile. Across the ridge from the Eureka and Mammoth a change in the ore seems to take place, more silver showing, while gold values are good. In the Chancellor mine native silver can be seen in nearly all the ore, while specimens are plastered with the metal.

Timber around the summit is scrubby and scarce, which makes steam expensive, but from 1 to 2 miles down on either side it becomes plentiful. There is an abundance of water, however, within a mile or two of any claim, so it is a question of transporting ore to water or generating electricity and conveying it to the mines. The average snowfall is 25 to 30 feet, seldom more than 4 feet deep at one time. The weather is mostly mild in winter, the thermometer standing about 20° above zero, with two or three days during the winter of 2° below.

Ventilation in Cornish Mines.

"For some time J. S. Haldane, F. R. S., has been engaged with J. S. Martin, Inspector of Mines, in an inquiry undertaken at the instance of the Home Office as to the ventilation of Cornish mines," says the London Post. "Of these, the largest and most important is Dolcoath, and for some years the men working there have suffered from a disease to which the name 'Dolcoath Anaemia' was given. They paled as to the face and lips, and if they exerted themselves they suffered from palpitation. They were liable to become dizzy and faint and were suspected of having heart disease. Almost the whole of the patients from Dolcoath had an itching of the skin, with pustular eruptions which they called 'hunches.' Neglected cases became gravely complicated, and there was a danger of heart failure. Death might occur, the immediate cause being some intercurrent disease, such as pneumonia or phthisis. Dropsy might also supervene."

"Most of the cases occurred in one particular shaft; indeed, everybody who worked there was affected in greater or less degree. Generally they were soon incapacitated from work underground, and it was found that they had improved rapidly when they had been employed for a little while at the surface, where daily re-infection was impossible. In some instances this beneficial change was effected simply by shifting them to another shaft."

"On investigation, Dr. Haldane came to the conclusion that the men were suffering from ankylostomiasis. This is a disease which is caused by a worm that

lives and multiplies in the upper part of the small intestine. The worm is about half an inch in length, and has a 'suctorial' mouth with four teeth. In 1854 it was recognized as being the cause of a disease then common in Egypt and known as 'Egyptian chlorosis.' Soon afterwards it was found to be common in Brazil, and since then it has been recognized as a frequent and a troublesome cause of disease in tropical and sub-tropical countries all over the world. The disease has occurred on the Continent—it broke out among the workmen engaged in making the St. Gothard tunnel—but in England it has only been observed by Dr. Manson among Lascars at the docks.

"Some three or four years ago it had occurred to the manager of Dolcoath that the disease might have some connection with a certain lack of cleanliness underground. He improved the ventilation, and he had large quantities of chloride of lime and permanganate of potash used in the infected parts of the mine. Dr. Haldane has no doubt that by taking this step he checked the progress of the disease. Cornish miners are constantly going abroad, but they frequently return after a short time, and sooner or later they go back to their old employment. Thus, it is supposed, Dolcoath was infected. The conditions were favorable; among other things the temperature was high. In one of the levels Dr. Haldane found it to be 79°. The disease, once it has been recognized, can be treated without difficulty, except in advanced cases, for the worms are expelled from the system immediately on the administration of thymol. At the time when this report was written, one patient was so ill that it was not thought that he could recover. Dr. Haldane states in an interim report to the Home Office, which has just been published, that steps have been taken to disinfect the dangerous parts of the mine, and to make the conditions such that the worm, even if it should be introduced by some one coming from abroad, will find life impossible. The precautions are all in the direction of securing cleanliness and good ventilation."

Survey in North Carolina.

Owing to the increasing interest in the mineral resources and the preservation of forests in North Carolina, the United States Geological Survey has decided to make a careful resurvey of about 1000 square miles in Burke, Caldwell, McDowell, Rutherford and Cleveland counties in this State. The work has already been begun under the charge of W. C. Hall, assisted by L. S. Leopold, O. E. Camp, C. E. Foster, R. C. Howard, C. Williams and I. K. Munroe.

The preliminary map of this section, made in 1886, shows in a general way the physical features of the country and the main roads. The map based on the new survey will show all roads and streams, all houses, mines and railroads, as well as the physical features of the country. The topography will be shown by contour lines representing altitudes above sea level, accurately drawn at vertical intervals of 100 feet. These lines will enable any one using the map to determine the elevation above sea level of any particular point. The positions of such contours are ascertained by running a great number of spirit-level lines, and the elevations of certain points in the area are shown by numerous bench marks (iron or stone posts set up) which have the altitude above sea level stamped upon them.

Immediately north of this area are the highest mountains in the United States east of the Rockies, and to the west is the far-famed "Land of the Sky"—Asheville and the beautiful French Broad River valley. The area is rich in mineral resources. Gold is found in several places, and also the peculiar earth from which is obtained monazite, used in the manufacture of mantles for incandescent lights like the Welshach burners.

Useful Combination Tongs.

A useful pair of combination tongs which any smith can easily make is illustrated herewith. The designer says: The tool shown I find of use as a pair of tongs, clip tie and holt head holder, both at the fire and at the vise. The jaws have a half round swage crease sunk on the inside of each. About ¼ inch from the outer end of each I sink a transverse or cross crease suitable for receiving the edge of the head of a holt. As it is deeper in the center than on either edge, it holds a short holt firmly in the fire or in the vise when welding, cutting threads, taking off nuts, or running

Combination Tongs.

down nuts on holts. This is done without damage to the heads. The ends of these tong handles are made one hooked, the other flat, straight and fitting inside the hook of the other handle. This forms a clip tie. Such tongs will be found a combination which will save a blacksmith many steps during a day's work looking for the tools which it combines. It will also hold flat and round iron.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence). — Mining operations around Nome are progressing, many dumps being taken out for the spring washing, particularly on Teluk and Otter creeks, and the pay seems to be uniform all along the beach line. Another and richer paystreak has been found farther inland, and near the foothills. What effect the wet winter and the heavy snowfall will have on the opening of the summer season remains to be seen. The past winter's snowfall has been the heaviest in the last four years, being 4 feet on a level. The ground is, however, not frozen to much depth owing to the early snow in the fall which protected the ground. Considerable interest is being shown in the Solomon River country, where rich diggings are reported. The tributaries of Shovel creek are attracting a good many, especially Mystery creek, where six camps have been working all winter. At the Big Hurrah quartz mine, owned by C. D. Lane of San Francisco, Cal., development is progressing, and the shaft is down 110 feet. Ore is being taken out, showing free gold. A number of other quartz mines are being developed.

Nome, March 1.

A stretch of 25 miles of proposed railroad from Valdez to Eagle City, on the Yukon river, will be built before winter, says Manager A. Biles. The company is made up of New York men. They purpose building the road for the development of the copper deposits in the Chitina region. Ultimately they intend to build branches, one from the junction of Chitina and Copper rivers to the Noselna placer district, and another down the Tanana to Fairbanks.

Manager W. S. Gage, for G. Mitchell of Cornwall, England, reports taking a bond on 105 copper claims owned by R. Blei & Co. of New York, in Copper River valley above Valdez, together with other Copper River properties, for \$12,000,000. Blei & Co. own other gold and copper claims in the same district. Gage also bought the Gladhaug mine on Latouch island, in Prince William sound, for \$1,000,000, of which \$100,000 was paid down. The copper properties sold are in Prince William Sound district and on Lakina, Kuskulna, Kotzina, Kinnikat and other interior rivers. The next steamer leaving Seattle, Wash., for Prince William sound will carry considerable machinery shipped by Manager Gage, including diamond drills.

ARIZONA.

COCHISE COUNTY.

At the Lake Superior & Pittsburg, near Bisbee, shaft No. 2 is down 1000 feet and shaft No. 3 is down 800 feet. At present work is being interrupted by an extra amount of water, which has to be pumped out and carried a distance in launders to prevent its flowing back into the mine workings, says the Review.

The El Capitan M. Co., which has been developing a group of claims near the Lime Kiln, north of Tombstone, has closed down for the present under orders from headquarters at New Orleans, La.

The Turquoise M. Co., W. H. McKittrick, manager, who resumed work on their group of claims near Gleason April 1st, have a diamond drill in operation and report satisfactory results.

The foundation for the smelter at Benson has been laid, it being built on the site of the one destroyed by fire, and will have a capacity of 100 tons daily. Some of the machinery is on the ground.

Michigan men have organized the Arizona & Michigan Development Co., to operate a group of sixty claims adjoining the Mitchell Development Co., in the Huachuca mountains, near Bisbee. Copper, gold and silver values are found.

At the Marquette & Arizona, near Bisbee, the hoist is in operation and sinking has resumed.

GILA COUNTY.

(Special Correspondence). — The Black Warrior C. Co., Amalgamated, at Black Warrior, report opening up a body of ore in the lower level, assaying 20% copper. The reduction works have resumed operations. J. A. Fleming is president.

Black Warrior, May 1.

M. L. Shackelford and M. C. Jolly of Prescott are reported to have located deposits of asbestos in Tonto district, 35 miles from Globe. They say the asbestos shows 3 miles long, 5 feet wide, on the surface.

The Arizona-Colorado Copper Belt & Gold M. & M. Co. report a strike made at a depth of 85 feet in the shaft being sunk

on the mine at Globe. The workings also struck water at this depth, which will necessitate putting in a pump and additional power. The vein found carries lead, silver and some copper values. Arrangements are being made to put in a pump and steam hoist. Work will continue, however, on other portions of the group, which consists of seventeen claims adjoining the Old Dominion, says Manager R. M. Foree.

GRAHAM COUNTY.

The Stevens Copper Co., near Murenci, have put in a 15 H. P. gasoline engine on a winch, in the tunnel, which is being sunk. The tunnel is in 1250 feet and is expected to cut the vein 350 feet farther in.

MOHAVE COUNTY.

(Special Correspondence). — J. Carroll reports finding silver ore near the Juno mine, a mile northwest of Chloride, and is sinking on a dike, the vein matter continuing to show values.

Contractor Sterzle, running a 100-foot drift on the 500 level of the Tennessee mine, is making good headway, though the rock is hard. The 100-ton mill is crushing steadily on ore from other parts of the mine.

The Elkhart mine was examined last week by prospective buyers. The mine is producing milling ore for the 100-ton concentrator, as well as ore for shipment. The strike made at the Dempsey & O'Dea mines, across the valley from Chloride, is showing up satisfactory values.

The ore body in the 150-foot shaft of the Fourth of March mine, east of Chloride, is increasing in size and value, gold values predominating.

The O. K. mill, in Gold Basin, is handling 100 tons of ore per day, which capacity is proving insufficient for the output of the mine, and breaking ore has been stopped in some parts of the underground workings. The mine has been shipping for some time. J. Godfrey is superintendent.

Dryden & Schemmelpennig, who shipped a carload of ore from their lease on the Altata mine last week, got returns of 106 ounces silver, 24% copper and \$2 gold per ton. They are getting another shipment ready.

The Southwest Turquoise Co. has incorporated at Mineral Park and taken over a number of turquoise claims in that district. W. J. Tarr of Los Angeles, Cal., is manager. — Ore is reported struck in the Rico mine, near Todd Basin, owned by H. Lovin and W. Clack of Kingman, which assays ten ounces in gold with values in silver.

Ore has been struck at the Midnight mine, near Niggerhead. The 40-stamp mill at the Leland mine will begin crushing next week on ores from the Gold Road mine at Acme.

Chloride, May 1.

H. F. Best of Savannah, Mo., president and manager of the Treasure Hill M. Co., operating at Stockton Hill, near Cerbat, says men have been put to work sinking the main shaft. A whim will be put up. L. M. Teale is superintendent.

R. A. McMullen, of West Superior, Wis., and W. J. Tarr, of Los Angeles, Cal., have bought several turquoise properties in the Mineral Park section, near Kingman. They expect to organize a company for mining the stone and building a lapidary plant in Los Angeles.

Parties owning the McCracken silver mine, 12 miles from Signal, are preparing to resume after an idleness of twenty years. Their mill is at Signal and was transported by means of a traction engine.

PIMA COUNTY.

(Special Correspondence). — J. P. Owens, general manager of the Sierrita M. & M. Co., has had Eastern men examining his mines. Besides the Sierrita mines, Mr. Owens has the Oro Blanco and Sorrel Top. Recent developments have demonstrated the gold values of these properties and abundance of water has been found in one of the shafts. These companies will erect reduction works. Mr. Owens has systematically blocked out the ore bodies.

Tucson, May 1.

The Old Boot copper mines in Silver Bell district, 65 miles north of Tucson, have been sold to E. B. Gage et al., comprising the Development Co. of America, for \$700,000. The same company owns the Congress gold mines and the Tombstone Con. mine at Tombstone, Cochise county.

PINAL COUNTY.

The Chicago owners of the Vulture mine, near Florence, are preparing to resume. Preliminary work has started and it is intended to sink a 1000-foot shaft, says the Blade. G. W. Sanders is superintendent.

YAVAPAI COUNTY.

(Special Correspondence). — The Burlington G. M. Co., operating in Big Bug district near Prescott, have struck an 18-

inch streak of ore that runs \$300 per ton in gold. They have one shaft down 200 feet and are starting another. This property is 1 mile east of the Postmaster mine on Big Bug, and near the P. & E. railroad. The company will put in a hoisting plant. H. A. Suttle, Peoria, Ill., is secretary and treasurer.

Providence, May 2.

A hoist will be put in at the Peck mine, near Prescott. The shaft, which is being sunk on new ground, is down 70 feet, and they have struck ore which goes seventy-five ounces per ton in silver. Six different leases have been granted, the lessees all working above the 250-foot level. They are taking out ore running 250 ounces per ton in silver, says the Journal-Miner.

Manager G. P. Harrington of the Tiger G. M. Co.'s Grey Eagle mine, in the Bradshaw mountains, southeast of Prescott, says he has sixty men at work. The 10-stamp mill is running steadily, making four tons of concentrates a day, the shipping points for which are Kirkland and Middleton stations. Additional machinery will be put in at the mine.

Work has resumed on the Bunker Hill mine, near Prescott, and two shifts are taking out shipping ore.

The mill and cyanide plant of the Gold & Copper Con. Co., on the President group, 12 miles south of Prescott, are running steadily.

The Bannie M. Co., near Prescott, has finished grading for the hoist, which is expected to be in operation by May 20.

J. Howell says the Gold Link M. Co. at Santa Maria expect to have their 20-stamp mill in operation by June 1.

Manager A. J. Pickrell reports having done 5000 feet of work on the Rockefeller mine, near Big Bug, since taking charge, and the shaft is down 700 feet. Between the fifth and sixth levels \$40 ore was struck near the Poland mine.

YUMA COUNTY.

The Arizona Placer Extraction Co. has been incorporated at Quartzsite, with M. H. Bohrer, president of the Desert Queen Co., as manager. This makes the seventh company organized in this district, all of which are practically under one management, says the Bisbee Miner.

The Socorro mine at Harrisburg has resumed operations with sixty men at work, says President J. C. Pratt of Hartford, Conn., who has been supervising the erection of the buildings and enlargement of the mill, as well as development work. A cyanide plant and an electric lighting plant have been added. The cyanide plant is double-decked and arranged for sluicing the tailings, says Pratt. — At the Planet mine, on Bill Williams Fork, Superintendent McCann is sinking another incline on the west side of the gulch to strike the ore shoot that crosses the gulch from the old workings.

CALIFORNIA.

AMADOR COUNTY.

Further improvements are proposed this season in the Bay State, Kretcher and Rhetta mines, controlled by the Rhetta Con. G. M. Co., near Sutter Creek, says J. Ross, Jr., of Sutter Creek, a director.

CALAVERAS COUNTY.

The Western Mines Co. have bought the Quartz Glen lode claim, Quartz Glen placer claim and Atwood placer claim, with buildings, machinery, tools, water rights, ditches, etc., near Rich Gulch.

The tunnel of the Jack Rabbit drift mine, near Angels, is in 950 feet, leaving 80 feet to be run to reach the channel. Little water has so far been found, says Superintendent F. R. Purlington.

The Benson mine, near Angels, has started to sink, the shaft being down 100 feet, and will go to 500 feet.

A strike is reported made in the east drift of the Star of the West mine at Rich Gulch, 6 miles east of Mokelumne Hill, showing free gold in quartz.

The new hoist built by the Gwin M. Co. at Gwin Mine, near Jackson, is in operation, says Superintendent D. McClure.

DEL NORTE COUNTY.

More men have been put on at the Haynes Flat placer mine, near Crescent City, says the Del Norte Record. New ditches are being made and others rebuilt. A sawmill will be built to make lumber for houses and fluming.

The Chinese Co., mining at Big Flat, near Crescent City, are piping, and a partial cleanup while overhauling the race last week showed satisfactory results.

EL DORADO COUNTY.

W. Dixon reports having struck a body of ore in the Revenge mine, near Greenwood, and he proposes putting up a small mill.

Superintendent Allen of the Havilah mine at Nashville says lumber and sulphides are being hauled in and the mine will

be reopened after an idleness of several years. The shaft is down 800 feet, and there is a 20-stamp mill.

Development work is going ahead at the Del Monte mine on the American river, a few miles below Coloma. The Monte M. & M. Co., recently organized by Sacramento men, intend to thoroughly develop the property. A millsite is being graded for a 5 stamp mill, and work on a ditch to convey water from the river for power purposes began this week. The tunnels have been retimbered and work resumed in the lower tunnel.

C. Waller of San Francisco, a director of the Zimmerman gravel mine at Placerville, says development work will be resumed May 10 with twenty-five men. Two three-drill air compressors are on the ground and are being set up. A tunnel 1200 feet in length will be run to tap the gravel channel.

It is reported the Zantgraf mine, near Auburn, will resume under new management.

FRESNO COUNTY.

The Wabash Oil Co. has entered the Coalinga field, buying out the Grant Oil Co., and has resumed drilling the well, which is down 600 feet. R. J. Dickson, of the El Capitan, is field manager for the company, and W. Ingels of Fresno president.

The rig that was destroyed by fire on the California Oil Fields, Ltd., at Coalinga, has been rebuilt and drilling resumed.

INYO COUNTY.

(Special Correspondence). — The 20-stamp mill at the Reward mine started up on the 1st inst. for its trial run. — The low-grade gold mines in the Alabama hills, near Lone Pine, are being reopened, with a number of miners on development work. — The Roosevelt Oil Co., operating near Haiwah Meadows, have a hole down 1000 feet, with favorable indications. — At Cerro Gordo T. Boland has eight men at work and is running his jig and concentrating plant, and a team makes daily trips to Keeler loaded with concentrates. — On the Morning Star mine development work continues, drifts being extended on the 350-foot and 450-foot levels, and the vein is being crosscut.

Cerro Gordo, May 4.

KERN COUNTY.

The Bakersfield to Point Richmond pipe line of the Standard Oil Co. is in operation as far as Corcoran, the end of the second 28-mile section, and the oil tanks at that station have been filled. The next two sections have been tested by water and are ready for the oil, which flows all right as soon as the pipe becomes warmed up. The line is cold, and the only difficulty experienced is from this fact, says the Reporter. Once it becomes warm it will never be allowed to get cold, as the oil will be run uninterruptedly. When the line is full it will contain 100,000 barrels of oil, and the tanks along the line will contain 200,000 barrels more.

LOS ANGELES COUNTY.

The Octave Oil Co. has incorporated at Whittier. D. Murphy, T. A. O'Donnell, G. Holterhoff, Jr., W. I. Hollingsworth and R. H. Lacy.

MADERA COUNTY.

(Special Correspondence). — The Star mine, on Mount Raymond, 5 miles east of Fish Camp, on the Yosemite road, is being reopened by P. and D. Clark of Spokane and Republic, Wash. This property was extensively equipped and slightly developed about fifteen years ago by a Montana company. An aerial tramway about 6000 feet long was put in, connecting the mine with a concentrating mill of 150 tons capacity. The ropeway passed over an intervening spur of the mountain, about 350 feet above the mine dump, and descended on the opposite side a vertical distance of nearly 1500 feet to the mill. The ore bodies occur in diorite and are mineralized shoots in crushed country rock. In some places solid masses of ore—lead, zinc, copper and iron sulphides carrying silver and some gold—occur. The ore bodies are large, if surface indications can be relied upon. They range from 5 or 6 feet to over 50 feet in width and have considerable longitudinal extent. Development work was commenced last fall and a crosscut tunnel driven 600 feet under the ridge previously mentioned, to reach the ore bodies in depth and to obviate the necessity in the future of transporting the ore over the ridge which intervenes between the mill and the mine. The mill is at an elevation of about 7500 feet above sea level and the mine at nearly 9000 feet. The ore contains chiefly lead and zinc sulphide, with silver, and it was due to the relatively large amount of zinc present that the former company discontinued operations; but, with the use of modern separators, it is expected the mill will produce a clean product.

Raymond, May 4.

MONO COUNTY.

At Bodie, the Standard Con. M. Co., regular operations continue with usual number of men at work. The South End mines are not running, but operations are expected to be resumed this summer. The Syndicate mine is running as usual and the mill was started last week. Work is being done at the Boston Con., and ore is accumulating in the bunkers.

In Sweetwater district, near Bridgeport, the Sweetwater Con. M. Co. will put on more men, the mill will be enlarged and additional machinery put in, says the Chronicle-Union.

NEVADA COUNTY.

Los Angeles men, including H. S. Smith and E. J. Delano, have an option on the Boss mine at North San Juan. The mine is owned by Page, Harding & McCutcheon of San Francisco, and has a Huntington mill and hoisting works. The shaft is down 127 feet. There is a large body of low-grade ore, averaging \$3 per ton in gold. It is intended to build a larger mill and hoisting works.

Manager C. Christopher of the Peabody mine, near Grass Valley, says the workings have been unwatered, and the shaft, pump rods and pump (which is at the 400-foot station) were found in good condition. It is reported the Ocean Star mine at Ormonde, near Grass Valley, will be started this month. The property is under bond to the Red Cross Co., F. Enzensperger, president.

Superintendent Brunnier says he has lowered the water in the Conlin mine, near Grass Valley, sufficiently to enable him to put men at work in the 500 level. The last heavy storm, which flooded so many mines, sent a large quantity of water into the Conlin. At the Lafayette, which the company also owns, work is progressing. The tunnel is being run on the vein.

Pumping operations have begun at the South Idaho mine, near Grass Valley, which is an extension of the Idaho mine. It is expected to be unwatered by May 10th, says Superintendent J. E. Carter. The bottom workings are down 150 feet.

At the Coe mine, on the Grass Valley and Nevada City road, near Grass Valley, Superintendent C. B. Lakeman, in drifting for the ledge which had been lost, struck a 10-foot vein on the 1000-foot level last week. It shows values in pyrite and galena.

Manager F. S. Morgan of the Pennsylvania mine, near Nevada City, reports opening up a body of free-gold ore on the 500-foot level, being a ledge not previously known. The find was made 400 feet north of the shaft, and 100 feet beyond former workings. The 10-stamp mill being built is expected to be in operation by May 10.

Preparations are being made to further develop the Ironclad mine, near Rough and Ready. Larger pumps will be put in and as soon as the mine has been unwatered underground work will begin. G. C. Day, principal owner, says he has interested Los Angeles men in the mine. The old pumps were unable to handle the volume of water which was struck with depth, and for some time the mine was worked but little.

PLACER COUNTY.

Local reports say the Sacramento M. & Dredging Co. of Sacramento proposes to operate on the tailings produced by the hydraulic mines of Iowa Hill and Gold Run, near Colfax, which emptied into the American river for a period of forty years. Beneath these tailings, it is thought, in many places lie bedrock gravel, which has never been disturbed.

The work of unwatering the Calf Pasture mine, near Auburn, is progressing.

The Nissen quartz claim on the Colfax and Forest Hill road has been sold to Russell et al. of San Francisco for \$8000.

The Bob mine, $2\frac{1}{2}$ miles above Auburn, is showing up well, says the Sentinel, and seven men are on development work. Drifts are being run and last week a new shaft was started. It is stated the company intend to build works on the American river several hundred feet below the mine, and a tunnel may be run from that point.

The Pingston mine, near Colfax, has closed down for an indefinite period, says the Sentinel.

The Gaylord mine, 2 miles east of Newcastle, is being reopened. Pay dirt was struck on this ground forty years ago. A company has been formed to operate the property and prospect for the channel in Long hill and a millsite and right of way for tailings bought.

SACRAMENTO COUNTY.

The Hupp & Roberts M. Co., which recently closed down its mine on the Perrazzo ranch, near Folsom, will prospect the ground with a drilling machine. The Old Homestead Co. is prospecting the Borges ranch, at Negro Hill, under bond.

SAN DIEGO COUNTY.

The Western Oil Co. has been organized at San Diego, to operate near Nestor, E. A. Hornbeck, E. Thelan, F. H. Samborn, J. A. Samborn, T. S. Kellett, S. K. Williamson and G. Putterbaugh.

Marr & Middaugh of Colorado Springs, Colo., have bought the Deer Park group of mines, near Descanso, and intend to begin development work next week. Additional machinery will be put in.

J. A. Rowand has a bond on the Owens mine, near Julian, by the terms of which he agrees to sink the main shaft 600 feet deeper—a total of 1000 feet, says the Julian Miner.

SAN MATEO COUNTY.

The Pilarcitos Oil Co., at Halfmoon Bay, report drilling in progress, and they are down 600 feet.

SANTA CLARA COUNTY.

Surveys have been made for a pipe line from the Watsonville Oil Co.'s wells near Sargents to Sargents station, where a storage tank will be placed so that cars may be loaded from a sidetrack.

SHASTA COUNTY.

A strike is reported made in the shaft of the Midas mine at Harrison gulch, near Redding, at depth of 700 feet. A drift started south on an 8-inch stringer, in 15 feet, widened to 3 feet, showing free gold.

C. H. McClure has bonded the Ariade and Lone Star quartz claims, adjoining the Miles claims, which he also has bonded on the east side of Squaw creek, near Winthrop (De Lamar).

W. G. Scott, local manager of the Great Western G. M. Co., superintending development work on the Afterthought copper mine, near Bella Vista, says an ore body is being opened up on the 200-foot level. An air compressor and machine drills will be put in. Most of the smelter machinery has arrived at Bella Vista.

Operations were resumed at the De Lamar smelter at Bully Hill at Winthrop on the 2d inst. The furnace was blown in and 250 men are now at work. It is proposed to build another furnace this summer. There is sufficient ore already roasted to keep the smelter running for several months, says Superintendent Keating, and the ore that is being mined and roasted insures a continuous run.

Washington advises state A. B. Searl, topographer United States Geological Survey, will, during the summer of 1903, take up the work of mapping an area of 40 square miles in Shasta county. All mines and prospects will be located, as well as all houses, roads, ditches, trails, etc. The survey will embrace the Bully Hill district, near Copper City, De Lamar and Salee, and those sections lying between and including the properties of the Iron Mountain C. Co., the Trinity C. M. Co. and also the Uncle Sam, Mammoth and Summit mines.

TUOLUMNE COUNTY.

The shaft in the Campo Seco mine, near Jamestown, is down 150 feet and a drift started.

The Chaparral quartz mine, near Groveland, has been bonded to J. R. Johnson for \$10,000. S. M. Cox has bought a one-fourth interest in the Ready Relief quartz mine, near Sonora. S. A. Knapp of Tonopah, Nev., has bought the A. G. Wedekind claims and all interest in the water ditch and water right, which commences on the south fork of the Stanislaus river at the mouth of Experimental gulch, near Columbia.

F. Baker has bought a one-quarter interest in the Marlow mine, with all water rights and ditches, including 800 inches water right of Long gulch and 1000 inches of Turnback creek, near Carters.

The El Rico M. Co. has incorporated at San Francisco to operate the Bell mine, near Tuttletown. S. D. Woods, G. W. Myers, J. Spiers, W. J. Rule, T. H. Johnson, T. S. Bullock, W. Hewitt and P. S. Reardon. W. J. Rule is superintendent. The shaft is down 508 feet and in ore, and drifts and crosscuts have been run on all but the 500-foot level. It is intended to put in an air compressor and build a 10-stamp mill.

The tunnel of the Over mine, near Sonora, which tapped the shaft 1000 feet from the surface has been extended 500 feet to the south. The operators have leased additional ground.

The Marian and Marguerite quartz mines in Yankee Hill section, southeast of Columbia, have resumed.

Twenty-five men are at work at the Doyle gravel claim, near Columbia, under the management of W. S. Estey and R. Stanford, with O. Doyle as foreman. The hoist is in operation and good gravel is reported being taken out. Washing of the gravel was delayed by making a lower grade to the ditch, which was finished last week. The shaft is 125 feet deep and there are 150 feet of drifts on the east rim

with center of the channel not in sight, says Estey.

The stamps were started dropping in the mill at the John Royal mine, near Columbia, last week, says Superintendent W. A. Holmes.

The P. Shine placers, consisting of fourteen acres at Columbia have been bonded to J. M. Meighan, J. M. Butenuth and a San Francisco man, who will prospect it.

The tunnel in the Stenchfield gravel claim on Table mountain, near Columbia, has been cleaned out for 1000 feet by G. Bolter, R. Thomas, J. and C. Sullivan, and a bed of pay gravel has been opened up.

The Norwegian mine, near Tuttletown, has resumed, after a temporary shut-down.

VENTURA COUNTY.

The Pacific Coast Oil Co. has completed a pipe line to the Modesto field, north of Piru City. The oil will be piped to the Ventura tanks of the company.

The Santa Paula-Satcoy Oil Co. has been incorporated in San Francisco, A. C. Hellman, W. H. Morrow, B. G. Haskell, S. V. Smith, W. A. Costello, directors, to operate near Santa Paula.

YUBA COUNTY.

The Sebourg & Davis mine and mill near Rackerby have been sold and other claims in that district secured by purchase or bonding to L. H. Mitchell and F. E. Wright, with San Francisco men. Wright says the claims bought and bonded cover 500 acres, the two principal mines being the Spanish mine and the Sebourg & Davis mine and mill, though they have thirteen other claims. Men are at work taking out quartz and the mill is expected to be in operation by June 1. It has a capacity of sixty tons daily. The vein is 15 feet wide, carrying gold values.

COLORADO.

BOULDER COUNTY.

Manager Habriei of the St. Louis mine, near Caribou, has started up the concentrating mill again, having closed down last fall on account of a scarcity of water, but kept the mine working steadily.

Superintendent Grove has resumed operations at the Silver Point mine, near Caribou, and will sink the shaft 100 feet before starting another level. This mine is near the line of the United Gold Mines tunnel.

M. A. Smith and R. D. Stratton of New York, owners of the Northwestern mine, have resumed operations. Their ores carry values in gold, silver and copper. J. Jester is superintending the retimbering of the shaft. Additional machinery will be put in as soon as the roads are in condition. They intend sinking the shaft 250 feet, a total of 500 feet. As soon as the United Gold Mines tunnel reaches their ground they will sink to the level of the tunnel and connect with it.

CHAFFEE COUNTY.

E. T. Bowan is prospecting his granite quarries near the Ethel mine, near Turret.

CLEAR CREEK COUNTY.

A suspension of operations was caused at the property of the Oro Verde M. & M. Co. at Yankee last week on account of a break-down of the machinery. The company propose to erect its own mill this summer, put in an air compressor and increase development work.

A 3-foot ore body, carrying telluride, was opened up last week in the Treasure Vault mine in Virginia canyon, near Idaho Springs. J. W. Ward is part owner.

The Cedar Ridge M. & T. Co. was incorporated last week to operate a group of six claims on Santa Fe mountain, near the Coming Nation mine, near Georgetown. Their tunnel will parallel that of the Gold Plane Co. The incorporators are: W. A. Kalp of Mt. Pleasant, Pa.; J. D. Pierson of Kenton, Mich.; J. M. Sterling of Bridgeport, Conn., and P. M. Egart of Holland Patent, N. Y.—The Con. Gem M. Co. is building a machine shop at the Newton mill.

Five mines, near Idaho Springs, were closed down on the 2d inst. by a strike, due to a demand for an eight-hour day, the miners going to work on their own time and off on company time. This the companies refused to grant.

The Gladstone and Big Medicine groups, near Silver Plume, recently bought by the Arizona M. & Dev. Co., has begun operations, with F. A. Babcock, former owner, as superintendent. The mines are on Sherman mountain, east of the Wisconsin mine. The main tunnel of the Big Medicine cut the lode at a depth of 235 feet. A drift was run on the vein 420 feet, to where the lodes cross, at which point the ores gave returns of 152 ounces silver, 25% lead and \$5 in gold. An upraise of 40 feet shows quartz with glance, gray copper and lead. The main office of the company is at Oklahoma, I. T.

CUSTER COUNTY.

Near Rosita, Hendershoot & Nelson are working the Lucille, and have driven 300 feet of tunnel. They report opening up the vein between granite walls, which gives values of 100 ounces silver and \$6 in gold per ton.

Augustine Bros. are working a contract on Tip Top Nos 1 and 2. A company has been organized to work the lead and copper properties in Titusville district, near Silver Cliff. The King of the Carbonates at Westcliffe will resume.

More men have been taken on at the Toledo mine near Custer City. The management is running levels at 300 and 500 feet northwesterly to locate the ore body. The work is progressing. It is reported the Game Ridge silver mine, which has been idle for some time, will be reopened by Cincinnati men.

DELTA COUNTY.

L. B. Morris, assistant general manager of the Waunita Coal Co., says they are opening up their coal mines in the North Fork valley and midway on the river between Somerset and Paonia. The company owns 5000 acres of patented land lying on both sides of the North Fork of the Gunnison river, and they have a tunnel driven in on the coal for 600 feet. The coal is being hauled to the switch until their siding, tramway and tipples are built. Morris says this company are also operating in the southern part of the State and from one mine have a daily output of 1000 tons, which is handled principally over the Rock Island and Burlington railroads.

FREMONT COUNTY.

The United States smelting plant at Canyon City is being rapidly rebuilt. Eight carloads of steel for building bag houses are on the ground which is expected to be in place by May 20. The machine shop is ready for the machinery and the refinery and cooper hops are completed. All the buildings but bag houses will be larger than before. Two steel power houses are an addition, also ore and coal bins.

An oil strike is reported made in the Florence field by the Keystone Oil Co., owning 1400 acres 3 miles east of Florence. The drill broke into the flow at a depth of 2400 feet. It is expected to produce 200 barrels a day. Prospecting will continue on other parts of their holdings.

GILPIN COUNTY.

It is locally reported a company is to be formed to consolidate and operate the Portage, Blanche M., Lynne, Randolph Extension and El Dorado mines, near Russell Gulch, with S. T. Harris manager. At the Portage shaft a whim will be put in for present sinking operations. The bottom shows 5 feet of ore with a 6-inch shoot of sulphides on both walls. A new shaft will be sunk on the El Dorado, to be the main shaft of the group. This shaft will be sunk 200 feet west of the present shaft, which is down 200 feet.

During April the Fairfield G. M. Co., operating the Fairfield mine, in Russell district, shipped daily a cord of milling ore to the Hidden Treasure stamp mill at Black Hawk and four cars (seventy-five tons) of smelting ore to the Denver smelters. The milling ore averaged three ounces gold per cord and the smelting ore \$100 per ton. The mine is operated on a lease and bond, with W. M. Nickerson manager.

For the last week of April the shipment of smelting and crude ores, tailings and concentrates from the Black Hawk depot to the Denver smelters and to the Idaho Springs mill amounted to forty-seven cars or 940 tons, making total shipments for April 231 cars (4620 tons), being lower than the average, due to stormy weather and the continued shut-down of the Golden smelter.

J. C. Fleischutz, manager of the Roderick Flu and Protection gold mines, near Central City, has men retimbering the Roderick Flu shaft and is down 80 feet. A hoisting plant capable of sinking 1000 feet is proposed. The Gilpin County Tramway Railroad is built to the dump and timbers and coal can be hauled to the mine and on the return trip the ore sent to the mills at Central City and Black Hawk.

GUNNISON COUNTY.

The Dora M. Co. has resumed work on its placers in Union park, west of Tincup. The company owns 720 acres of placer ground and have built two reservoir dams, one of 400 feet and the other of 1000 feet, and several miles of ditch work and fluming.

LAKE COUNTY.

It is locally reported a deal is under way for the sale of the Resurrection mine, near Leadville, to the Western M. Co. (Guggenheim Exploration Co.), S. D. Nicholson, manager. The Resurrection mill is handling 110 tons daily of lead, zinc and iron ore.

Electricity will be used in the new mill near the Arkansas Valley smelter at Lead-

ville for the treatment of ores from the Yak tunnel. Electrical and magnetic devices for the separation of zinc will be used.

Company work has ceased temporarily on the Fanchon mine, near Leadville, but some of the subleases are working. The company expect to sink the Fanchon shaft another 100 feet.

H. J. Gaw, part owner of the President mine, near Leadville, says they will resume this month.

OURAY COUNTY.

A strike has been made in the Mickey Breen mine in Poughkeepsie gulch, near Ouray, says Superintendent F. M. Jackson. The values are principally silver and lead. The ore is being sacked and placed in the bin at the Mickey Breen mill, which will be put in operation by May 15. The concentrates will be packed down to the Red mountain and Ouray wagon road and hauled to Ouray.

SUMMIT COUNTY.

The G. M. K. M. Co. has incorporated under Colorado laws by Texas, Oklahoma and Colorado men, and began work last week on the Meagher group, being twenty-five acres of ground covering the extension of the Robinson ore shoot No. 1, at Robinson. The shaft is 160 feet deep and they propose to sink another 100 feet and begin drifting. A. M. Gaines is manager, and E. W. Kimber of Hobart, Okla., F. M. Bailey and C. A. Morris, of Texas, are interested.

TELLER COUNTY.

The values of the output of Cripple Creek district for April aggregated \$1,702,650; the tonnage for the month being 51,050 tons. This is an increase in value of \$506,501 over March, while the tonnage has decreased 524 tons. One of the features in bringing down the value of the total tonnage, says the Colorado Springs Gazette, is the starting up of the Magna Charta and Gillette cyanide plant; and the total value would have been further decreased had not the Aequa mill burned down during the first of the month. The figures for the month obtained from the mills and smelters are as follows:

Name.	Tons.	Av. Value.	Total Value.
U. S. R. & R. Co.	20,000	\$25.00	\$500,000
Portland.....	7,500	25.00	187,500
Economic.....	4,200	27.00	117,400
Telluride.....	3,500	25.00	87,500
Dorcas.....	3,200	27.50	88,000
Magna Charta..	300	4.00	1,200
Gillette.....	350	3.00	1,050
Smelters.....	12,000	60.00	720,000
Total.....	51,050	\$25.00	\$1,702,650

A lease on the Lost claim on Mineral hill, near Cripple Creek, has been given to G. Anderson for eighteen months at 15% royalty.

The El Paso Gold King at Cripple Creek has out the main water channel of the district, says the Times. The water channel was opened in the drift at a depth of 900 feet, and during the past few weeks the water has been rising in the shaft. The past week the pumps have been raising 1000 gallons a minute, the result being the water has only been lowered 2 feet in the shaft during that time. Whether or not the company will continue to pump this amount of water is not known, as it is thought that when the drainage tunnel is completed in August water will not longer bother them.

The Cripple Creek Enterprise G. M. Co. at Cripple Creek is drifting and cross-cutting in the 200-foot level. The drifts are being extended southeast and northwest, the former to cut the National Hotel vein, while the latter is expected to cut the vein opened at the surface on Fifth and Carr avenue. Eighty feet of work has been done, says Manager Hanley, and he does not expect to reach ore in paying quantities until 200 feet from the shaft is made.

Of the ten sets of lessees and sub-lessees operating on the Bonanza King group at Cripple Creek all are getting out ore. They are operating from surface down to depth of 350 feet. The best ore and largest shipments are being made by the Gold Cord Co., having a lease on blocks Nos. 11 and 14. The shaft is down 240 feet, where a drift is being run. A body of ore was opened up in a drift off the 150 foot level and the drift which is being run from the bottom of the shaft is to get under this ore. The streak found in the 150-foot level is 14 inches wide and gives values of three ounces in gold per ton.

The United G. M. Co. report striking the ore body last week in the 600-foot level of the Deadwood mine, near Cripple Creek. The company is making a carload of ore a day from the mine.

In the Wild Horse development is progressing.

On the Silver Tip claim, up the hill, at a depth of 40 feet, lessees are breaking ore 2 feet in width that averages \$40 per ton in gold.

A carload of ore was sent out this week

from the south half of block seven of the Cameron school section, near Cameron, under lease to the German American M. Co. The ore is coming from a depth of 157 feet in the shaft, the vein showing 4 1/2 feet in width, average value \$20 per ton. The main shaft is down 178 feet, at which depth another vein has been cut. At 157 feet a crosscut has been run 95 feet to get under a vein found at 80 feet depth. At this point a winze is being sunk on the vein to connect with a drift from the shaft. The company also continues sinking the shaft.

The Economic mill, near Cripple Creek, is running steadily, treating an average of 180 tons of ore per day, but this month there is expected to be an increase.

IDAHO.

BANNOCK COUNTY.

The Juanita M. & M. Co. has incorporated at Ogden, Utah, to operate the Juanita, Resort, Hard Cash and Fleetwood claims in Port Neuf canyon, between Pocatello and McCammon; A. Patterson, C. C. Behler, H. Perkins, J. Kinney, F. W. Mozenett, J. Coyle, A. Hodgins, O. O. Johns are incorporators, and the principal place of business Ogden, Utah.

BLAINE COUNTY.

Work in the shaft sunk in the Dithmer group, in Colorado gulch, near Hailey, to determine if the body of galena struck continues in depth, had to be discontinued last week because of the inflow of water which necessitated the driving of a tunnel to drain it. It will be driven 275 feet as a crosscut, then continued in the ledge to the ore body, giving 400 feet of back.

At the Minnie Moore mine, near Bellevue, machinery has been placed in the new hoist and underground operations were resumed last week. The recent strike in the Tip Top mine on the gold belt, 11 miles west of Hailey, owned by J. Q. Packard of Salt Lake City, Utah, was made on the 1100-foot level in the shaft. There are twenty miners at work, and the stamp mill is running steadily.

IDAHO COUNTY.

Roosevelt reports say the shortage in food supplies in Thunder Mountain district is causing great inconvenience. Meat is 40 cents a pound, and coffee, sugar and tobacco correspondingly high. What supplies are coming in are sent by mail and registered. It is reported that the 10-stamp mill at the Dewey mine will be enlarged.

SHOSHONE COUNTY.

The Gold Standard M. Co., operating on Pony gulch, near Wallace, is fluming its strippings over 200 feet of riffles in a 1700-foot flume and catching gold in paying quantities. As soon as the stripping is completed the hydraulic elevator will be put in operation cleaning the bedrock. This process will be repeated each year until the entire property is worked out. There is completed 1600 feet of the flume of the New Jersey M. & M. Co. on Big creek, near Wallace. There still remains 6737 feet to be built.

(Special Correspondence).—The Highland Chief M. Co. are opening up a property in the Coeur d'Alene, 3 miles south of the Bunker Hill & Sullivan mine. Two months ago they struck the ore body at a depth of 300 feet, cutting a large body, 8 feet of which is high-grade ore for that district. They are getting ready to place a compressor plant on the mine and expect to put up a concentrator plant in the fall. B. L. Grant of St. Paul, Minn., is president.

Wardner, May 3.

INDIANA.

DELAWARE COUNTY.

Albany reports say hundreds of acres of land are being bought up near Albany by oil promoters. Oil has been known there for a number of years. During the natural gas fever the Ohio Pipe Line Co. sank a large number of wells, and of these wells thirty bore oil instead of gas and were plugged. Some of them are said to have oil standing in them to a depth of 700 feet. Southeast of Albany are wells producing from 50 to 100 barrels a day.

INDIAN TERRITORY.

CHOCTAW NATION.

It is reported that H. C. Frick of Pittsburgh, Pa., J. W. Gates of Chicago, Ill., and G. Gould of New York have formed a pool for securing control of coal lands in the Choctaw Nation. A survey by the Geological Survey shows that there are 440,000 acres of these coal lands, and the pool has agreed to pay \$25 an acre for the entire area. At present all the coal mines in the nation are being worked under lease; but now that the allotment is to be completed, Secretary of the Interior Hitchcock has decided that it will be to the interest of the Indians to sell the lands outright rather than to continue the lease system under individual ownership.

The coal lands have been segregated and are to be sold at auction within a few months. The pool is said to have arranged with the companies now mining under leases to permit the companies to buy the lands they have leased. If any companies are not in a position to buy their lands, the pool will buy them and continue the leases at the present royalty of 8 cents a ton.

MICHIGAN.

HOUGHTON COUNTY.

The Baltic mine, near Houghton, is making a current output at the rate of 11,000,000 pounds of copper per annum. Rock shipments to the mill are 1640 tons daily, and as a result of some improvements under way at the mill it is expected a larger tonnage will be treated. The group south of No. 3 shaft, in the direction of Trimountain, is showing the best results of any portion of the mine, making it certain that the company will open a new shaft in this direction next year. North of No. 5 shaft appearances are said to be not as favorable. Forty-six machines are operated at the Baltic, of which ten are engaged at other than stoping work. The average cost per ton of rock handled and per pound of copper produced has been lessened the past year. The company has 600 men on the payroll.

The Osceola mill returns from the Kearsarge lode, near Calumet, show a mineral output for April, with the fifth stamp at the mill operating but part time, of 800 tons, from which the yield of refined copper was 75%. The refined output is dressing 2% higher than the average of last year.

The April output of the Wolverine mine, near Calumet, amounted to 499 1/2 tons, the total being cut down by the strike of the trammers.

MONTANA.

Following is the output of the two principal gold producing counties for April:

	1903.	1902
Fergus.....	\$109,127 19	\$19,531 32
Lewis and Clarke.	27,714 02	33,615 43

During April the Government assay office at Helena received \$206,938 63, as compared with \$137,803.36 in April, 1902, an increase of \$69,135.10, Montana mines shipping \$172,365 27, as compared with \$103,312 27 during April, 1902.

FERGUS COUNTY.

H. McEvony & Sons are working their Big Six group of mines near Gilt Edge. The ore is oxidized and amenable to cyanide, assaying \$6.

FLATHEAD COUNTY.

The Spokane & Montana M. Co. has incorporated to develop placer and quartz mining claims near Libby; G. Robinson of Libby, F. M. Fortune, J. F. Collins, O. W. Ames and E. Denzer, all of Spokane, Wash. Their holdings include the Keystone, Galt, Blue Bird, Mary Gold, North Star and others.

GALLATIN COUNTY.

T. H. Barlow and H. C. Armstrong are developing near Bozeman a deposit of asbestos and will make a sample shipment next week.

T. Machiner & Co., who are developing copper claims near Bozeman, report having struck a 6-foot vein carrying 6% copper, with some gold and silver.

JEFFERSON COUNTY.
